GILD OF ST. MATTHEW, THE: A Christian Socialist society founded in 1877 by some of the young men and women of Bethnal Green who had come under the influence of the Rev. Stewart D. Headlam, curate of the parish church. It was the outcome of the belief that the atheistic secularism of Mr. Bradlaugh and the Hall of Science was the result of the secular work of Christ and His Church having been neglected by churchmen. When Mr. Headlam had to leave Bethnal Green, the gild, with Mr. Fred. Verender as its secretary, extended its work and sent lecturers far and wide to secular halls, working men's clubs, etc. Besides the warden and secretary, Mr. Shuttleworth, Mr. Hancock, Mr. Carson, Mr. W. E. Morris, Mr. Dearmer, Mr. Moll, and Mr. Merson were priests who took an active part in the gild work.

The gild's study of social and political questions has made it a society of Socialists, sacerdotalists, and sacramentalists. It took an active part in the reception of Mr. Henry George, and the propagation of his principles, with which in England the name of Mr. Verender will always be connected. *The Church Reformer* was for ten years its organ, and the future church historian will find the columns of this publication replete with valuable information. The gild is mainly responsible for the Christian Socialist movement begun by Maurice and Kingsley having spread and fructified among "High Churchmen"; it has always been a small body—generally about 100 priests and about 150 laymen. Besides its general socialistic propaganda, and its insistence on the necessity of getting the mass restored to its proper unique place in the Church worship, it has worked for the abolition of the patron and the establishment of the parish in his place; for the State confining its educational function to secular schooling, and has strongly opposed municipal Puritanism. During the Easter of 1906 it organized a clerical address of congratulation to the thirty Labor members of Parliament. It also in that year undertook the circulation of a dozen little books of the Faith and Freedom Press designed to save the clergy, Sunday-school teachers, and others from spreading crude and false notions of the Christian faith which are the notions which skeptics so easily attack.

The chief work of the gild is now done by the members in their various parishes, and by the circulation of literature. The books on which they specially rely for this work are: The Rev. Thomas Hancock's "Pulpit and the Press," "The Banner of Christ in the Hands of the Socialists," and "God as Our Schoolmaster is Always in All Schools"; the Rev. Stewart D. Headlam's "Laws of Eternal Life," being lessons on the church catechism, "The Meaning of the Mass," "Secular Schools," "Priestcraft and Progress," "Municipal Puritanism," and "Christian Socialism"; Rev. Conrad Noel's "Day of the Sun." Also Mr. G. Shea's "What It Is and Who Should Join It," "The Church and the Polling Booth," "Disorders in the Church" (maintaining that they are social and industrial, not ritual), and many other leaflets. These can all be obtained from Mr. Fred. Verender, 376 Strand, London, W. C., England. STEWART D. HEADLAM.

GILDS: The various trade- and labor-unions, as well as friendly societies, etc., are treated in separate articles. Under this head are considered only the ancient labor-unions and the medieval gilds.

I. Ancient Labor-Unions

That labor-unions have existed all through history has long been known, but only recently have they been carefully studied. Particularly has Mr. C. Osborne Ward investigated the subject, and his "The Ancient Lowly," altho he reaches conclusions by no means accepted by all scholars, contains a fund of valuable information. According to Mr. Ward, the gild grew from the family. When the paterfamilias died the oldest son usually took his place; but some of the younger sons, being of the same blood as the head of the family, would rebel at this. Out of this division, according to Mr. Ward, came classes—the aristocrats, or heads of families, and the dispossessed freemen who were not slaves. These developed the artizan classes and, when these united, the first labor-unions. These unions were connected with a religious cult. As the aristocrats worshiped the shades of their ancestors, and made that worship the center of the family, so the labor-unions found their patron gods.

The date of the earliest labor organization cannot be fixed; but it must have been very early. As early as 1180 B.C., according to Plutarch's "Theseus," one Menestheus rose against the aristocrats at Athens to demand for the people the right to be initiated into the Eleusinian mysteries. There must have been at least some understanding between working men at this time, and one of their first grievances was that they were excluded from the aristocratic religious rites, the aristocrats teaching that working men had no souls. A fragment from the age of Solon shows that in his time (about 600 B.C.) trade-unions were common (Granier's "Histoire des Classes Ouvrières," pp. 283-287). The celebrated Roman Law of the Twelve Tables specified the manner of organization of working men, and is declared by some (Gaius's "Digest"; Plutarch's "Numa") to be a translation from the Greek law of Solon; and the law of Solon is said to be a paraphrase of the still more ancient law of Amasis, King of Egypt. References are found by some to trade-unions in the Bible, in the time of Joshua (1537-1427), and certainly in the time of Solomon. Hiram of Tyre, who is said to have been the architect of the Temple at Jerusalem, brought with him from Tyre 3,200 foremen and 40,000 free artificers—not a large number, when it took the immortal Phidias, Callicrates, the chief architect Ictinus, and probably 50,000 unionist craftsmen ten years to design and complete the Parthenon—the perfection of architectural art.

By the time of Numa Pompilius we find unions fully developed and recognized by law. (See Plutarch's "Numa.") Mommsen ("De Coll. and Sod. Rom.," p. 78) says: "The relics of innumerable communal associations of ancient times are seen scattered all through Italy, as found among the inscriptions of the Italian towns." Down to A.D. 58 of the times of the emperors, the right of working men in Rome to organize was unabridged. Numa divided the unions into eight great classes, a clear witness to their number. Later, the unions became innumerable. Ward describes a great number both Greek and Roman. The source of our knowledge of these is mainly from inscriptions, tablets, columns, and mutilated manuscripts. Most of the historians were too aristocratic to notice labor organizations, and, according to Ward, the references they did make to uprisings of slaves and laborers were mutilated by aristocrats.

The early Greek unions were called *thiasotai* (or disciples of mutual love), *sussiotai* (or those who eat at a common table), *omotaphotai* (or burial societies). According to Ward, the *hetarotai* and *hetarai* were male and female associates of labor societies, and only later was the latter term used for prostitutes, because laborers were despised. Ward mentions especially the Greek *thiasotai* and *eranotai* as general names for Greek gilds. Of the Roman organizations we have fuller information. The *Fabri navalis*, or ship carpenters and boat-makers of the Tiber; the *collegium vasculorum* (metal vessel makers); the *collegium pistorum* (millers); the *collegium incendiariorum* (firemen); the *collegium vinariorum* (wine dealers); even the *collegium lupanariorum* (brothel keepers); the *collegium biselliariorum* (makers of chairs for the gods); the *collegium centonariorum* (ragpickers or junkmen); the *collegium soliariorum* (shoemakers); the *fullonum sodalicum* (fullers); the *corpus nemestiacorum* (fortune-tellers); the *collegium armiariorum* (gladiators); the *communio mirmironum* (actors); the *collegium castrensium* (sutlers); the *collegium vinatorum* (planters); the *collegium farrariorum* (mowers), and a long list of others too numerous to mention.

Names

These *collegia* seem to have been scattered all over the Roman Empire, in Asia Minor, the Greek islands, Spain, and Gaul, as well as in Greece and Rome. Mr. Ward says they were established in England by the Romans, and gave rise to the medieval gilds, especially in Kent, whence "the men of Kent" brought the Labor movement to America.

All these unions were more or less combinations of religious societies, burial societies, convivial societies, and friendly societies, with dues and benefits. Each organization took some patron god and celebrated his worship. They had banners and processions and days of worship. This was partly to cover their meeting for other purposes. They had occasional or regular convivial meetings, and suppers in common, and their dues were sometimes simply exacted to meet the expense of these. Almost invariably they were burial societies with dues to meet the expense of the burial, of which the ancients made much. Sometimes they were trade-unions and friendly societies in the modern sense. They had fixed prayers and a ritual for the conduct of their meetings. Their officers were presiding officers (of both sexes), a "president of finance," a stewardess or housewife, a manager or trustee, a recording secretary or scribe, lawyers to defend the members, priests to conduct the religious rites.

Some of the inscriptions give the best picture of their organization. One written in plain Attic Greek (translated in the *Revue Archéologique*) reads: "Because of reliable and just administration of the common fund of money of the community of *erastotai*, and having ever conducted himself with kindness and with honesty; and because he has righteously husbanded the funds successively paid by the *erastotai* themselves, as well as the annual subscription, according to the law of the *erastas*, and in view of the fact that in everything else he still continues to show integrity to the oath which he swore to the *erastotai*, therefore hail Alceon. The community of the *erastotai* rejoice to praise Alceon, son of Thon, a stranger who has been naturalized—their president of finance—and do crown him with a chaplet of foliage because of his faithfulness

Organ- ization

and good-will to them. They are, moreover, rejoiced, and praise the trustees, and also the priests (chaplains) of Jupiter the Savior, and of Hercules, and of the Savior of the Gods. And they crown each of them with the wreath of honor because of their virtue, and their lively interest in the community of the *erastotai*."

The stone is broken and the date is gone, but it seems to be of the Aristotelian period.

That these unions were very much like modern trade-unions, and even in advance of many present unions, is seen by the following inscription, discovered at Pompeii, showing that they endeavored to influence politics, and that they honored women (Ward's translation):

1. "The members of the Fishermen's Union nominate Popedius Rufus for member of the Board of Public Works."
2. "The International Gold Workers' Association of the City of Pompeii demand for Member of the Board of Public Works Cuspius Pansa."
3. "Verna, the home-born, with her pupils in all right, put Mrs. Capella to the front for a seat on the Board of Magistrates."

To these unions Ward ascribes great influence in ancient times. Socrates, he says, was a member of them; and his last words as he lay dying was to remind his disciples that they (the *thiasotai* or brethren) owed their cook for a chicken on which they had banqueted. Southern Italy had a great many of these unions, and here Plato found a system of communisms supposed to have been founded by Pythagoras. Jesus Christ, Ward believes to have belonged to such a union, and to simply have proclaimed successfully to the world the brotherhood and equality which the unions had long preached and striven for in private. The early Christian churches, he says, were first developed where these unions were strong, as at Pergamus, Laodicea, Ephesus, and

Hierapolis ("the seven churches"), Antioch, Rhodes, and elsewhere. Many of these unions doubtless became corrupt; their feasts became feasts of revelry and dissipation; but originally, according to Ward, the Bacchic festivities, the Bacchanalia and Saturnalia, were not licentious.

These unions were almost exclusively of free working men, tho occasionally slaves were admitted. But the condition of the slaves was terrible in the extreme. At Sparta, Lycurgus instituted a communism, but it rested on slavery of the helots. There were common tables, but they were waited upon by nearly naked slaves.

Slaves

The slaves were State slaves, and were flogged once a day. The young *ephori* were taught to hunt for the helots and kill them as they toiled in the fields, in order to keep the helot class in subjection. Two thousand helots are known to have been killed in the fields at one time. At Athens slaves worked the State mines at Laurium and elsewhere, both sexes working naked in the mines under the lash, and loaded with chains. In Rome they were made to fight each other and wild beasts in the arena. In Sicily they were housed in dungeons, compelled to work naked in the fields, beaten, tortured, crucified. Hence arose great slave strikes.

The earliest slave strike in Greece was probably a rising of the Spartan helots, which was put down in cold blood in the time of Agis I. (about 1055 B.C.). During the Peloponnesian wars there was a great strike of the 30,000 Athenian slaves at Sunium, who went over in a body to the enemy, Sparta (413 B.C.). Another strike seems to have occurred at the same place, B.C. 133, when 1,000 slave miners killed their overseers and rushed into the town and temple for security, but were finally overpowered. According to Livy ("Annales," lib. iv., 45) the slaves rose in Rome 407 B.C., and tried to fire the city, but were betrayed and the ringleaders crucified. B.C. 194, the slaves rose in Latium and gained the city, but were again betrayed to forces marching from Rome, and some 2,000 were slaughtered (Livy, xxxii., "Epitomy"). B.C. 196, a great strike seems to have taken place in Etruria, and another in Apulia, B.C. 185-184 (Livy, xxxix.). In the island of Chios the slaves rose at an uncertain date, and, under Drimakos, a soothsayer, escaped to the mountains and maintained independence there under their slave king. But finally, according to the story, the *Chiois* offering a great reward for Drimakos's head, the old man called a boy friend to him and had him cut off his head to get the reward, which the youth did, a temple afterward being built to Drimakos. In Sicily, under Eunus, 143-133 B.C., the slaves rose and conquered their masters and chose Eunus king, and finally had a force of 200,000 men, defeating army after army sent against them from Rome during a period of six years. In Pergamus, in Asia Minor (B.C. 130), King Attalus willed his empire to Rome; but Aristonicus, a natural brother, roused the slaves, and offered them their freedom if they would support him. He, with his *erastotai*, defied Rome and defeated her consular armies, till finally overthrown by M. Paperna (B.C. 104). Another great slave rising took place in Sicily under Athenion, who united with the free workmen and defeated Rome in six great battles. The rising of the gladiators under Spartacus is better known. Spartacus at Capua plotted his escape with 200 gladiators, 74 B.C. Gaining weapons, they attracted slaves and working men to them till they had ultimately an army of 300,000 men. He defeated army after army of the Romans by shrewd tactics and desperate valor, but finally was conquered by Crassus, Spartacus himself perishing in the battle; 60,000 workmen fell in the battle, and 6,000 were crucified by the Romans along the road from Capua to Rome.

II. Medieval Gilds

The medieval gild in one sense doubtless sprang from the ancient labor-unions, but in an important sense it did not. Medieval life sprang from Germanic life, adapted to and molded by the Roman civilization it overran. Wherever the Germanic tribes went, in Germany, England, France, Italy, or Spain, they found labor-unions, and, as it were, inherited them. Yet is the medieval gild essentially German and not Roman.

The Roman gilds were mainly of slaves or of the despised. The medieval gilds were composed essentially of freemen. They were not simply trade-unions.

Some have argued that the medieval gilds sprang from the early common banquets of the Gothic tribes. They more probably sprang from a variety of causes. The name "gild" is probably derived from the Anglo-Saxon *gilden* or *gildan*, "to pay," since a distinctive feature of all the gilds was the common contribution or assessment.

Origin

The word at first seems to have been used for any association for any purpose that had contributions to a common fund. "The early gilds," says Professor Seligman, "had no connection with trade or industry." They were largely social, often protective, sometimes political, almost always with a religious spirit. Says Gierke ("Deutsches Genossenschafts-Recht," p. 227): "The old Germanic gild embraced the whole man and was intended to satisfy all human purposes; it was a union such as exists to-day only in our towns or states; it answered at the same time religious, moral, social, economical, and political purposes."

An important variety of these gilds were the *frith*, or *peace gilds*, sworn communities for the protection of right and the preservation of liberty. Many gilds were formed by and often composed of the clergy. A still larger class were purely social and charitable. There were said to have been as many as 900 gilds in the county of Norfolk alone. Contributions to the common treasury, masses for the living, and funeral rites for the deceased brethren, observance of a mutual charity, and the bathing, feeding, and clothing of 100 poor men, are among the obligations of most of the gilds whose members promised to conduct themselves as righteously as possible, and be of "one heart and of one soul."

These gilds, of one kind or another, extended all over Germanic Europe and endured in most countries till the time of the Reformation, and in a few instances to the nineteenth century. In England, Henry VIII. sequestered the property of the religious gilds. In Denmark and North Germany their property was devoted to the public service. The most important, however, of all medieval gilds were the *gilds-merchant* and the *craft gilds*. The former came first and grew to great power, becoming often the real municipal corporation of the towns. Gradually, however, the craft gilds gained upon them, and finally replaced them.

III. Gilds-Merchant

The gilds-merchant in all European countries seem to have been developed about the same time. In England, they are mentioned first in "Doomsday Book," both knighten-gild and gild-merchant existing at Nottingham. Lincoln is said to have had one during the Danish supremacy, and soon after *Doomsday* they are frequently mentioned in town charters. The drapers' company of Hamburg dates from 1153, and that of the shoemakers of Magdeburg from 1157. Similar associations existed in Milan about the same time. They were common in France

Development

in the reign of Louis IX. By the close of the twelfth century they were general throughout Europe. The Hanseatic League, which was practically a league of North German gilds-merchant, and which came to have such power, dates from the thirteenth century. Their charters were essentially monopoly licenses to sell. With the license also went certain privileges and exemptions. Says Professor Seligman, from whose "Two Chapters on the Medieval Gilds of England" we derive much information:

"It was essential for the merchant traveling from town to town, or even trading within the burgh, to be freed from these burdens, and we find accordingly immunities of this kind in almost every case."

"Another privilege that is often mentioned is the *hansa*. What this was is not very clear. The magnificence of the Hanseatic League and its branches in medieval England are

well known, and the Steelyard of the hanse-merchants or Easterlings, who were already protected by *Æthelstan*, became a renowned institution of London. . . . But the term is much older, and occurs frequently in the English charters, probably at first having reference to the privileges of merchants when away from home. For the English had their gilds in foreign ports also. Its meaning, however, soon became equivalent to gild, or the rights of a gild, and in this generic signification it is used all through the later documents. The 'hanse of the gild' thus became a collective name, which included all the usual attributes of a trading corporation."

The constitution of the gilds shows their character. Seligman tells us that "at the head stood the alderman or master, who probably paid something for his position, and at his side were the wardens or stewards, and occasionally other officers, such as seneschals, ushers, clerks, deans, and chaplains. Membership was obtained by heredity, purchase, or gift, and frequent mention is made of the seats of the associates, which probably referred to their position at the feasts or the arrangement of the booths in fair-time."

Constitution

The alienation of the seats, whether by sale or gift, was forbidden, and while the sons and sometimes the nephews and daughters of members were admitted free of all charges, others were obliged to pay an entrance fee and produce two sureties. In the oath that was administered on initiation, the new member pledged himself to conform to the ordinances, to be subject to the same burdens as his fellows, to inform the officials and inhabitants if he discovered any merchant in town who was not a member, and to obey the command of the mayor as well as to maintain the good usages of the city. Peace and good-will between the members were enjoined; provisions of a charitable character, such as alms to the impoverished and visits to the imprisoned, are occasionally found; the morning speeches and periodical banquets were not omitted, and the members were admonished not to forget to drink their gild-merchant, on which festive occasions the officers availed themselves of the opportunity to collect the taxes."

The gild-merchant was then at the outset a mere company of traders; but the term merchant, which by no means conveyed the same ideas as at present, included not only those that carried on foreign commerce, but petty traders of all kinds, even artisans. The gild, however, in course of time lost its character as a purely private society, and became closely connected with the municipal organization, altho never identical with it. When the towns and boroughs obtained charters, they took care to have it included that the men of the place should also have their gild-merchant. "Gild law" often became the law of the town. But in England and the north of Europe the gilds-merchant, having grown rich and tyrannical, excluded the landless men of the handicrafts; these then uniting among themselves, there arose everywhere by the side of the gilds-merchant the craft gilds, which gained the upper hand on the Continent in the struggle for liberty in the thirteenth and fourteenth centuries. In England these companies usually existed side by side with the old town or merchant-gild; until at length their increasing importance caused the decay of the old gilds, and the adoption of these crafts as part of the constitution of the towns (thirteenth to fifteenth century).

In the great cities like London and Florence the gilds-merchant, if organized, never seem to have taken deep hold. The craft gilds seem to have been early organized.

IV. Craft Gilds

The origin of these craft gilds is more disputed than that of the gilds-merchant. There are three main views. Brentano, in his "Gilds and Trade-Unions," argues that they were associations of craftsmen to protect themselves from "the abuse of power on the part of the lords of the town, who tried to reduce the free to the dependence of the unfree."

Origin

There seems, however, little to support this view. Dr. Cunningham ("History of Industry and Commerce," vol. i., p. 310) says

they were "called into being not out of antagonism to existing authorities, but as new institutions, to which special parts of their own duties were delegated by the burgh officers or the local gild-merchant." Professor Ashley ("Introduction to Economic History and Theory") takes the middle ground that they were self-governing bodies of craftsmen, more or less under municipal control. They are, however, in no case to be identified with modern trade-unions, and tho Brentano and Mr. George Howell following him have held that modern trade-unions are descended from them, there seems to be no proof of this. The prototype of the modern trade-union is to be sought rather in the journeymen associations that sprang up later, as the craft gilds grow aristocratic and wealthy. The craft gilds were rather gilds of employers. As the gilds-merchant were monopolies in traffic, so the craft gilds were monopolies in production.

The early charters, says Professor Seligman, all contain as a cardinal point the provision that no one should venture to carry on the trade either in the city or suburbs unless a member.

The crafts could thus not be initiated without permission. The towns often assumed the right of recognizing the formation of gilds, which was regarded as a perfectly legitimate exercise of municipal powers. The regulations of the craft were subject to the periodical approval of the municipal officers, and the gilds were formed and recognized as welcome auxiliaries to the means for the enforcement of the market laws. Care, indeed, must be taken not to exaggerate the involuntary character of the unions, for the early rights of the craft gilds were probably, in part at least, the growth of self-assertion. But, above all, the ordinances were the outgrowth of a general medieval policy.

Their constitution resembled that of the gilds-merchant. The unions known by the names of mystery, faculty, trade, fellowship, or (from the fact of possessing particular costumes) livery company, were divided into two or three categories. At the side of the alderman or master, the chief officer, stood four or six wardens or searchers who possess the general authority to inspect work and rectify abuses. As in all gilds, the social gatherings, processions, and annual feasts played a great rôle, and we find here and there provisions for the common welfare, assistance to the needy, and the maintenance of a chaplain. But these few ordinances of a charitable character played an exceedingly insignificant part in the constitution of the craft gilds. The true significance of the crafts was economic, not social.

Membership in the gild in the period of their prosperity depended on full citizenship. Non-citizens, whether aliens or simple strangers, enjoyed but a precarious position. The qualification of freeman was necessarily relaxed in the case of women, who were also admitted as members, for certain occupations were almost exclusively conducted by them.

But participation in the franchise was not enough. A perfect acquaintance with the details of the trade and the ability to produce good work were in all cases preliminary requisites. In fact, the main provisions of the craft, the very soul of its constitution, were the regulations intended to insure the excellence of the products and the capacity of the workman. The ordinances almost invariably commence with a recital

of the various subterfuges employed by knavish artificers to deceive the public.

The whole character of the craft gild is seen by these regulations to be due to the compulsion of the city authorities rather than to any philanthropic anxiety on the part of the trades. Carefully ascertained rules as to the exact proportion and quality of the raw materials were prescribed with great minuteness; the mixing of good and bad wares was strictly prohibited, and the greatest care was exercised in the selection of proper tools.

Similar considerations led to the prohibition of night-work or sales by candle-light. Said an edict: "The spurriers shall not work after curfew, 'by reason that no man can work so neatly by night as by day,' and especially because many persons 'compass how to practise deception in their work,' and introduce false and cracked iron for tin and put gilt on false copper."

It was imperative on the craftsman to furnish an adequate guaranty of his fitness to join the gild and produce good work. This guaranty consisted in the fact of a previous apprenticeship and the evidence of a good moral character. The apprenticeship continued as a rule for seven years, when, in Germany at least, the apprentice was given an opportunity to travel (*Wanderjahre*) and study his craft in other cities. On his return home he was expected to produce some masterpiece to show his skill, and only then was he admitted into the gild of his trade.

These regulations were but a part of the whole medieval system. The Middle Ages were a period of customary, not of competitive prices, and

Trade System

the idea of permitting agreements to be decided by the "higgling of the market" was an impossibility, because the laws of the market were not left to the free arbitrament of the contracting parties. The severance of occupations was imposed upon the trades, not spontaneously adopted by them, and the medieval statutes teem with provisions of this nature, as, for instance, that shoemakers shall not be tanners, brewers not be coopers, cordwainers not be curriers, butchers not be cooks, drapers not be "litsters," while a statute of 1363 admonishes all artificers and handicraft people to use only one mystery or occupation.

But the subordination of the gilds to the general laws of the realm constitutes only one half of the explanation. The other half must be sought in the commanding influence of the towns in economic life. All powers of market and social police were from the first massed in the hands of the urban authorities. The gilds developed and were developed by this life. They aided, too, in art and religion.

All medieval gilds, as has been said, were largely religious; and Gierke says in his "*Deutsches Genossenschafts-Recht*" (p. 227): "As a religious community, as a union for worship, which probably the name signifies, every gild had a patron saint, whose name it bore, and by whom its members swore, and an altar of its own, which it maintained. The erection of benevolent institutions, perpetual masses, and similar gifts to the Church, the giving of alms and the assistance of pilgrims, the maintenance of altar lights, and other pious acts were matters of the union and among its purposes."

Says Mr. J. Bleeker Miller: "That was a time when the *Cathedral* system was the religious or-

ganization of a great city, with its centralized government under one head, its chapter of priests who attended to the religious wants of the city as a whole, and with the citizens divided according to their trades and professions into smaller religious and political communities, called gilds."

The gilds did much for charity. A brother of the craft would give house and lands to better the annual feast, which the craft always held; or he might found a school, a hospital, or an almshouse, and after defining the amount of his benefaction, would leave the surplus, if any, to the discretion of the gild. Or he would make the gild the trustees of the fund, from which the mass priest should receive his stipend for spiritual offices, the residue being left to the gild as remuneration for management. Occasionally the corporations bargained for the amount of the spiritual service, and refused to agree to a proposal which might be too costly for the fund to bear. They exacted fees for apprenticeship, for taking up freedom by inheritance or servitude, and more lately for admission into the gild by purchase. Like prudent men, who might be liable to occasional charges, they saved and invested these funds, as also gifts for lending without usury to poorer citizens, for apprenticing poor boys or girls, or for marriage portions, or for widows' pensions, or for the relief of the destitute members of the craft, the first and the most enduring duty of the gild. The gild estates, the chest of the company, its revenues and rents, were, like the endowments of an academical college, at once the support of the fraternity and the means by which the discipline of the order or craft was maintained.

Of their life Seligman says:

But there was no monopoly or exaggerated exclusiveness. Any one could become apprentice, and the number was limited only by the ability of the master to support them or by considerations of a police nature. The apprentice formed a member of the master's family. For the principles of the law of parent and child were made applicable to a certain extent, and all responsibility for purchases of the apprentices as well as for their behavior were imposed on the masters by city ordinance. From one of the indentures that have been preserved we can obtain a clear view of his position. The apprentice is to keep his master's secrets, do him no injury, nor commit excessive waste of his goods. He is not to frequent taverns, commit fornication or adultery with the housemaids or in town, nor betroth himself without his master's permission. He is not to wear certain garments, play at dice, checkers, or any other unlawful game, but is to conduct himself soberly and piously as a good and faithful servant, or in default to serve double time. The master, on the other hand, agrees to find him in all necessities, food, clothing, bed, and so on, for four years. In the fifth year he finds himself, but receives 20s. and the tools of the trade; and in the sixth year he gets 40s., but finds his own tools. The master agrees on his side to teach him the craft without any concealment.

The condition of the workmen proper was essentially similar. They were known by the various names of varlet, sergeant, yeoman, garçon, bachelor, allowe, and journeyman, and were taken for any stipulated period, although probably at first engaged by the day, as the last term implies. Restrictions were rarely placed on their number; but the necessities of a small household would in general preclude the master from employing more than a limited number.

All possible disputes were settled primarily by the wardens, some of whom were in certain crafts chosen from the ranks of the journeymen themselves. If the master refused to give the stipulated wages, the wardens forbade him to work until the obligation should be fulfilled. The journeyman was likewise protected against other exactions on the part of unscrupulous masters, such as attempts to compel him to serve beyond his time or against his will, while a stimulus was given to loyal fidelity by prescribing assistance out of the gild funds in case of illness or misfortune.

But a conflict of interests was in general unknown. The journeyman always looked forward to the period when he would be admitted to the freedom of the trade. This was a rule not difficult for an expert workman to attain. No insuperable obstacle was thrown in his path. In fact, there was no superabundance of skilled labor at this time. It was a period of supremacy of labor over capital, and the master worked beside the artisan.

V. Journeymen's Associations

Naturally, however, there were sporadic cases of disaffection on the part of workmen against imagined or real maltreatment by the master. Out of them came the journeymen's associations. Thus in 1303, in one of the earliest craft ordinances that we possess, the journeymen cordwainers of London are forbidden to assemble or make any provisions prejudicial to their masters or to the public. But altho this, as well as the similar case of the journeymen weavers in 1362, resembles to a certain degree our modern strike and boycott, it is not indicative of any general banding together of the men against the employers.

At first these associations were simple fraternities of a social character. They were considered harmless and in most cases freely permitted. Sometimes, however, they were prohibited, as tending to weaken the paternal authority of the craftsmen. The "congregations" of the journeymen cordwainers above mentioned were doubtless of this class, and continued, for over three quarters of a century later they are again charged with making an illegal fraternity, for which they sought a confirmation from the Pope. The general proclamation of 1383 was, however, not directed especially against such associations, as has been represented. For this forbade conspiracies and combinations of all kinds, and did not mention the workmen at all. Probably the regulation was designed to prevent the recurrence of such riots as had taken place during Wat Tyler's uprising in 1381. The character of the early journeymen's gilds is shown by their fraternities in Coventry, where the journeymen or young people of various trades, "observing what merry meetings and feasts their masters had, themselves wanted the like pleasure, and did therefore of their own accord assemble together, and for their better conjunction make choice of a master with clerks and officers." But as this was found to be "the prejudice of the other gilds and disturbance of the city," the mayor and citizens petitioned the king, in 1425, to abolish them.

The journeymen's associations which later seem to have been quite common (for a statute of 1402 speaks of "fraternities or gilds of servants" in general) were thus mere social brotherhoods, formed by the young "desirous of merry meetings and feasts." It is not permissible to cite them as proving any conflict between labor and capital at this period. The unions were everywhere confined to the youths, who in turn gradually became masters and were enrolled as full members of the craft gild proper. But gradually this changed. The gilds became too rich and strong, and were hated. Says Professor James, in a chapter written for McNeill's "Labor Movement":

The complaints about the heartless policy of the gilds began as early as the fifteenth century, and did not die out until the gilds themselves died. During the fifteenth century the abolition of the gilds was demanded on this ground. When Henry III., of France, in 1281, extended the provisions of the gilds to all branches of mechanical industry in France, the Parliament refused at first to register the edict. In 1614, the third estate in France moved the abolition of the gilds; in 1624, a party in the city council of Bremen; in 1669, the Elector of Brandenburg, in the German Parliament, made the same motion. In Prussia, beginning with 1688, a series of laws was adopted looking toward the reformation of the gilds in the direction of greater freedom, and in the interest of a growing industry. But the chief attack upon the old gild system came on its theoretical side from Adam Smith and the French Physiocrats.

Downfall

God, said the physiocratic school of economists, made the right to labor the property of every person by giving to every one wants and referring him to labor as a means of satisfying them. This property is the first in order of time, the most holy and the most inalienable. Owing to the restrictions on labor maintained by the gilds, the poor are condemned to protract a precarious existence under the control of the masters, to linger in poverty or to betake themselves and their industry to foreign lands. Just as the whole existing system of law had proceeded from the selfish efforts of privileged classes, who resisted every reform, so in making the regulations in regard to organization of the system of apprentices and journeymen the councilors of the government had always been the employers. They served merely to secure to the masters the labor of the apprentice for a long time at a very low rate of wages or for no wages at all; to keep down the wages of the journeyman and to diminish competition by limiting the number of masters. It is one of the first duties of justice to free those whose only property consists in the skill and strength of their hands from the limitations placed upon them by the gilds.

Justice and economic expediency thus united in demanding the freedom of labor. The same demand for freedom of industry and of contract was made by those interested in the large industry which was now beginning to rise in England. The gild system was in the interest of the small employer, but opposed to the interest of the large employer. The mere requirement that a man should have passed through an apprenticeship, and, on the Continent, a journeyman'ship also, stood in the way of those who wished to utilize their capital.

Thus theory and pecuniary interest united in demanding the abolition of the old system. In France, the old system was abolished on the memorable night of Aug. 4, 1789. In Germany, Prussia, in 1810, was the first to do away with the old system completely. England, under the control of the large capitalists, abolished the apprentice law of 1562 in 1814.

The prohibitions of coalitions of laborers were, however, left on the statute-books. The prohibitions in England were abolished by the law of 1824. In France they were not abolished until 1864; for all Germany not until 1871; for Austria in 1870. Nevertheless, many traces of the medieval gilds still remain, especially in England. (See LONDON.)

In Scotland, the companies of merchant free-men still exercise great power, and the magistrate next in rank to the mayor (provost) is the dean of the gild. But all these modern city gilds are mainly mere inherited monopolies.

GILL, ALFRED HENRY: English Labor Member of Parliament; born at Rochdale, 1856; commenced work at seven by selling newspapers; and at ten was employed as half-timer in a cotton-mill. At the age of twenty-three he went to Oldham, where he worked as a cotton-spinner. In 1886 he became chairman of the Crompton cooperative society, and ten years later was appointed general secretary of the Bolton Operative Spinners' Association. In 1899 he became a justice of the peace. Elected to Parliament in 1906 for the District of Bolton, he was chairman of the Parliamentary Committee of the Trades-Union Congress for 1906-7. Address: 61 Hampden Street, Bolton, England.

GILMAN, CHARLOTTE PERKINS (formerly **MRS. STETSON**): American author and lecturer; born in Hartford, Conn., 1860. She early took an active interest in social matters, and in 1890 be-

gan lecturing in California for the Nationalists; since then she has lectured in all parts of the United States and in England. She has been identified with the Socialist Party, the People's Party, and, especially, the Woman's Movement. For nine months (1895-96) she was engaged in settlement work in Chicago. Mrs. Gilman is a liberal Socialist. She advocates the economic independence of women; and she believes that social life is organic, that industries are the organic functions of society, and that human work is not proportioned according to individual desire but to the social energy previously supplied to the individual. Hence she maintains that property rights inhere in the consumer's needs, because only when these needs are met can society secure his best product. Among her works may be mentioned: "In This Our World," a volume of verse, 1898; "Women and Economics," 1898; "Concerning Children," 1900; "The Home," 1903; "Human Work," 1904. Address: 179 West Seventy-sixth Street, New York City.

GILMAN, NICHOLAS PAINE: American clergyman and sociologist; born in Quincy, Ill., 1849. His early education was obtained in the public schools and academies of Maine and New Hampshire, and at the Harvard Divinity School, from which he was graduated in 1871. From 1872-84, with the exception of 1878-81, when he was professor in Antioch College, he was pastor of Unitarian churches in Scituate, Bolton, and Wayland, Mass. Mr. Gilman was associate editor of the *Unitarian Review* of Boston, 1885-90; editor of the *Literary World* of Boston, 1888-96; and editor of *The New World*, 1892-1900. From 1892 to 1896 he was secretary of the Association for the Promotion of Profit Sharing, and editor of *Employer and Employed*. In 1895 he became professor of sociology in Meadville Theological School, Meadville, Pa. In addition to numerous articles on religious and theological subjects, he has written: "Profit Sharing between Employer and Employee," 1889; "Laws of Daily Conduct," 1891; "Socialism and the American Spirit," 1893; "A Dividend to Labor," 1899; "Methods of Industrial Peace," 1904. Address: Meadville, Pa.

GIOJA, MELCHIORRE: Italian economist; born in Piacenza, Italy, 1767. Receiving priest's orders, he welcomed the entry of the French into Italy, and argued for the establishment of an Italian republic. Made State historian, he lost this position by a work he wrote on divorce (1803), and being afterward placed in charge of the Italian statistics, he lost this office by his criticism of State officials. He was in prison for eight months in 1820 on a charge of conspiring with the Carbonari. Gioja was among the foremost Italian economists of his day, a leader in statistical science, and a critical student of all economical schools. He largely favored State interference. Among his works are: "Nuovo Prospetto delle Scienze Economiche," 1815-19; and "Filosofia della Statistica," 1826. He died in 1829.

GIRLS' FRIENDLY SOCIETY, THE: A society organized in England for women of all ages and of all ranks of society in all parts of the world for mutual help. Its aim is declared to be to set before its members a high ideal of purity of thought, word, and deed; to help them to be true to that ideal; to be a standing witness to the possibility of purity of life and conduct for every

woman and girl in the land; to guard the hundreds of thousands of girls who are growing up to womanhood from acknowledged dangers, and to extend to them the boon of loving Christian fellowship and of fellowship in Christian work.

The various departments include help for sick members, the care of workhouse children, registry work, protection in emigration and in traveling, the provision of lodges and recreation rooms, industrial training, and the encouragement of temperance and thrift. There are 1,442 branches and 164,174 members. The patroness of the English society is the queen and the society enrolls some 300,000. *Secretary:* Miss Ethel Smith. *Central office:* 39, Victoria Street, Westminster, S. W.

The Girls' Friendly Society in America was organized 1877. It has 487 branches and 5,848 associates and 23,714 members and probationers in the United States. *General Secretary:* Miss Eve Alexander, 659 West Lexington Street, Baltimore, Md. *Central office:* Church Mission House, New York City.

GLADDEN, WASHINGTON: American author and clergyman; born at Pottsgrove, Pa., 1836; was graduated from Williams College in 1859 (D.D., LL.D.). He entered the Congregational ministry and held several pastorates; since 1882 that of the First Congregational Church at Columbus, Ohio. He has been a voluminous writer of books and articles, particularly on Christian social problems and work. He represents the progressive, tho not radical, Christian Social thought, favoring many socialist proposals and principles; yet he is not a Socialist. Recently he attained particular prominence by urging that the Congregational Missionary Society should return a large gift from Mr. J. D. Rockefeller, on the ground that it was "tainted money." Among his works may be mentioned: "Working Men and Their Employers," 1876; "Applied Christianity," 1887; "Tools and the Man," 1893; and "Christianity and Socialism," 1905. *Address:* Columbus, Ohio.

GLASGOW: Among the cities of the world Glasgow has a preeminent reputation for the boldness of its municipal enterprise. It is, however, seriously handicapped, as compared with many European towns, by the fact that it has been built almost entirely on privately owned land, a circumstance which renders every improvement scheme highly expensive. The local habit, too, of building the dwellings in tenement blocks of four flats or stories, with one outer entrance and inner staircase common to them all, and in which, as a rule, some twelve families reside, causes a great crowding of the population. Except in the outskirts of the city, there are no gardens or front plots whatever, each tenement block being provided with an asphalted back court with a common wash-house and ash-pit. It takes a vast deal of municipal improvement to give a favorable aspect to a city so closely built as this, with the children compelled to pass their outdoor life on the streets. The streets themselves, however, are wide and excellently made; and in the center of the city there are numerous handsome warehouses, shops, and public buildings. Next to London, Glasgow has the largest population of any British town. Within the municipal boundaries it has 800,000 inhabitants; with suburbs included there are about 1,000,000

(1906). About one fifth of the people are of Irish birth or descent. The chief industries are engineering, iron-founding, ship-building, and textile manufactures. Its shipping is the greatest in the world, and its warehouse accommodation and general commercial trade is unrivaled for a town of its size. Its university and its other educational institutions are of a high rank. Lord Kelvin, the famous physicist, was professor in the university for some forty years.

The era of municipal enterprise in Glasgow began with its water scheme in 1860, the first great undertaking of the kind in Britain. Previous to that time the city had been poorly supplied with water by a private company, a number of old wells, and the muddy water of the river Clyde.

Municipal Enterprises

The municipality boldly launched out on a scheme to bring the water from Loch Katrine, thirty-seven miles away, at an initial cost of \$10,000,000. Since then additional culverts have been laid, until the total capital invested in the enterprise amounts to more than \$20,000,000. The charge for water is rated as low as fivepence in the pound, as compared with one shilling and twopence (nearly treble the price) charged by the old, private company. Nevertheless, after allowing for all expenditures, including sinking-fund and interest on capital, a clear profit of some \$21,000 is carried forward every year. Glasgow was also one of the first cities to municipalize its gas supply (1869) at an initial cost of over \$2,500,000, since increased by extensions of the system to \$10,500,000. Again, notwithstanding that the rate charged per thousand cubic feet has been reduced from 4s. 7d. to 2s. 1d., and after allowing for all expenditures, including sinking-fund and interest on capital, a net profit of \$250,000 is available every year toward paying off the debt. The city also owns its electric supply, from which it derives considerable profit; and it was the first British town to adopt a municipal telephone service in competition with the private National Telephone Company, reducing the charges by one half, and again making a profit. This service was sold at cost price in 1906 to the Government Postal Department, which intends taking over the entire telephone systems of the country.

Another great scheme adopted by Glasgow was that of the City Improvement Trust (1866), which, together with subsequent improvements and housing schemes, has quite remodeled the central part of the city. Slums have been swept away, streets widened, and artisans' dwellings erected; so that the old "salt market," "High Street," and other quarters made famous by Sir Walter Scott's novels have been modernized beyond all recognition. These improvements have not, however, been accomplished without contingent drawbacks. The squalid and criminal classes have been dispersed among the more reputable working class population, where their depraved habits have had a contaminating effect. Thus it is said that drunkenness has been spreading among the working girls and women, and that the children's manners have suffered. "Hooliganism," too, is unfortunately wide-spread, chiefly, it is said, among the Irish laboring class. Perhaps the most doubtful of Glasgow's schemes is that of the Municipal Model Lodging Houses. There are some seven establishments of this kind, accom-

City Improvement Trust

modating altogether (in 1905) 2,166 men and 248 women. Each person has a separate sleeping cubicle for which a charge of three and a half to four and a half pence a night is made; a common dining-room is provided; food is cooked free of further charge; and there are baths and recreation halls attached.

There are many social reformers who incline to the opinion that these Model Lodging Houses tend to lower the standard of living among the laboring class, and to discourage civic responsibility, home life, and regular habits. As a makeshift, however, they are a great improvement upon the dens formerly provided by private lodging-house keepers for that class of people. A notable experiment was made in 1896 by the establishment of a "family home" at a cost of \$85,000. Its use is restricted to widowers with families. There are 160 bedrooms, each capable of accommodating one adult and three children, a common dining-room, kitchen with steam cooking boilers, a nursery, recreation hall, and baths. The rent is for a widower and one child \$1 a week, and with three children \$1.25. Board, consisting of breakfast, dinner, and tea, is at the rate of twenty-four cents per day for adults, forty-four cents a week for one child, and \$1 a week for three children. Children of school age are sent to the public schools, and those under school age are nursed and cared for during the day. At present the home just about clears its expenses.

Glasgow is the pioneer of municipal trolleys, and the remarkable success of its system has led other towns in Britain to follow its example.

Street-Cars

Perhaps, too, the fame of its profitable enterprise in this direction has been one of the chief incentives in the great movement in favor of municipal socialism in Britain. It is also worthy of note that the demand for the municipalization of the trolley service in Glasgow was chiefly due to the propaganda of the Socialists in the Trades Council and among the electorate of the city. The cars were taken over from the existing private company in 1892. Since then the municipality has electrified and greatly extended the system. The economic results have been most striking. The wages of the men, which formerly ranged from as low as 16s. a week, are now fixed at a minimum of 25s., and at the same time the hours of work have been shortened from an average of thirteen or fourteen to ten hours a day. The minimum fare has been lowered from one penny to half a penny, and fares for long distances have been so much reduced that it has been calculated that in fares alone the community now saves over \$1,000,000 a year. In addition to this there is a net profit, after paying interest on capital and allowing for a sinking-fund, etc., of about \$1,000,000 a year, of which about \$850,000 is retained for depreciation and a reserve fund, and about \$150,000 is contributed to the rates. The system now extends to neighboring towns seven or eight miles east and west from the center of the city, and the municipality manufactures some of its own cars.

Sewage Disposal

At enormous cost Glasgow has recently been engaged in disposing of its sewage so as to avoid polluting the river. Two great underground conduits have now been made on the north side of the river by which the sewage is collected and treated by chemical precipitation and filtration, the solid matter being afterward

pressed into cakes and sold as a manure. Another conduit is being made on the south side, and when this is completed the entire sewage of the city will be disposed of by this method. In 1868 Glasgow decided to establish a Cleansing Department, and now the whole work of scavengering is done by its own staff. The refuse is sifted, a portion being sent to the destructors and a portion being sold to farmers, for which purpose the Cleansing Department owns nearly 1,000 railway wagons. The wharves and docks and the navigation of the river are under the management of a public trust on which the City Council is represented.

The city owns six large public halls in several of which municipal concerts and organ recitals are given every Saturday afternoon during the greater part of the year for a nominal charge. Band performances are also given in the public parks. There are eight splendid municipal bathing establishments, and free libraries are established in every district. The city owns half a dozen great public parks, as well as a fine suburban estate recently gifted to it. A unique possession is a large mountain headland, some ten miles long and one to three miles broad, situated between two beautiful arms of the Firth of Clyde, about thirty miles from the city, which by the terms of the gift must forever be retained as a holiday ground for the people. The city also owns a small island and several farms upon which experiments with the unemployed are being made.

The further municipal undertakings must be briefly summarized. There are public markets, abattoirs, technical colleges, boarding-schools, children's gymnasia, art-galleries, a People's Recreation Palace, bowling-greens, wash-houses, lunatic asylums, hospitals for infectious diseases, fire-brigades, etc. The City Council is also agitating strongly to obtain powers from Parliament to tax land values, and the more advanced section of its members are pressing proposals for municipal fire-insurance, coal-supply, milk-depots, and bakeries.

City Government

The Corporation of Glasgow consists of the Lord Provost, bailies, and town councilors, the latter being elected for a term of three years. The councilors in turn elect from among themselves the bailies who act as magistrates in the police courts, but, unlike aldermen in England, have no extended term of office. The Lord Provost is chosen annually by the Council. Until the advent of the Labor Party (about 1890) the Council elections were not fought on political or party lines; each candidate stood solely upon his own record or program. There is now, however, a tendency for candidates to come forward as nominees of sections such as the Ratepayers or Anti-Municipalization Party, the Temperance Party, and the Labor Party. The last named numbers about a dozen in a council, which is composed of about eighty representatives, but the majority of the members are usually favorable to progressive enterprises.

Recently an attempt has been made to lessen the drunkenness of the city by the restriction of licenses and the closing of public houses (which open at 8 A.M.) at 10 P.M., an hour earlier than formerly. In Glasgow, as in all Scottish towns, public houses are completely closed on Sundays. It is noticeable that in recent years the strict religious observance of Sunday has disappeared, Sunday concerts and political meetings and all

manner of pleasure-seeking being now quite common in the city.

J. BRUCE GLASIER.

GLASIER, J. BRUCE: Scotch Socialist and editor; born in Glasgow, 1859. As a boy he herded sheep in the county of Ayr, and later was apprenticed to an architect, and afterwards engaged in designing art metal work. One of the first avowed Socialists in the modern movement in Britain, as far back as 1879 and 1880 he advocated Socialist views in Glasgow. He took an active part in the Henry George, Crofter, and Irish Land League agitations. Together with a few other Socialists he founded the Social Democratic Federation in Scotland, but seceded from that body when the Socialist League was formed in 1884. Glasier was for many years the most active apostle of socialism in Scotland, writing locally but contributing also articles to *Morris's Commonweal*. He joined the Independent Labor Party on its formation in 1893, and in the same year married the young Socialist speaker Katherine St. John Conway; since then both have devoted their lives to the Socialist agitation. Glasier was elected chairman of the Independent Labor Party in succession to Keir Hardie; and at the general election in 1906 he contested the Bordesley division of Birmingham as a Socialist. He is now (1907) editor of the *Labor Leader*, which, under his management, has become the chief organ of the Socialist and the Labor movements in Great Britain. Author of numerous socialist pamphlets and songs. Address: Chapel-en-le-Frith, Derbyshire, England.

GLENN, JOHN M.: Secretary of the Sage Endowment (q. v.); born Baltimore, 1858; graduated at Washington and Lee University; was admitted to the Maryland bar 1881, and actively practised law ten years. Increasingly interested in practical philanthropies, he has since devoted his time wholly to philanthropic work. He became chairman of the joint executive committee of the Federated Charities of Baltimore, secretary of the State Tuberculosis Commission, lecturer on social work at Johns Hopkins University, president of the National Conferences of Charities and Corrections (1901); since 1904 president of the Supervisors of City Charities. In 1907 he was chosen first director of the Sage Endowment. His wife, Mrs. Mary W. B. Glenn, has been his active associate, as also secretary of the Baltimore Charity Organization Society. Address: 30 Broad Street, New York City.

GLOVER, THOMAS: English Labor Member of Parliament; born at Prescott, Lancashire, 1852; worked in the coal mines at the age of nine; and in 1867 was appointed secretary of a local branch of the Miners' Union. In 1880 he was instrumental in founding the St. Helens District Miners' Association; and he also helped to found the Miners' Federation of Great Britain. He has been treasurer of the Lancashire and Cheshire Miners' Federation since 1905, and in 1906 was returned to Parliament from St. Helens. Address: 56 Bickernstaffe Street, St. Helens, Lancaster, England.

GOBLET, RENÉ MARIE: French Socialist; born at Aire, Pas-de-Calais, 1828; entered the legal profession, then journalism, and, later, politics. In 1870 he was procureur-général at

Amiens; and in 1871 a representative for La Somme, being a Republican of the Left, and tho at first a supporter of the government, he gradually became more and more independent. From January to August, 1882, he held the portfolio of the Interior in the Freycinet Cabinet; and from April, 1885, to December, 1886, that of Public Instruction under Brisson. From 1886-87 he was President of the Council; and from April, 1888, to April, 1889, Minister of Foreign Affairs. He is considered a leading Socialist in French Government circles. In 1891 he was elected a senator for the Department of the Seine, and in 1893 a deputy from the first arrondissement of Paris. Failing of reelection in 1898 he retired to private life. Besides numerous essays, etc., he has published: "La Revision de la Constitution," 1893.

GODIN, JEAN BAPTISTE ANDRÉ: French politician; founder of the *Familistère* at Guise; born at Esquéhéries, Aisne, 1817. Early engaging in industry, in 1847 he moved his works to Guise, and became interested in cooperation as a disciple of Fourier. In 1859 he commenced his famous *Familistère*, or communal home, and rapidly developed it. In 1870 he was elected Mayor of Guise, and in 1871 representative for Aisne. In 1871 he published his "Solutions Sociales," an account of his *Familistère*. He fully established profit-sharing in 1876, and in 1886 made the *Familistère de Guise* a cooperative society, associating in his firm thirty-two clerks or workmen. From 1876-88 the average sales were 3,935,600 francs, with a gross profit of 735,000 frs., which were distributed among the workmen, the capital, the common fund, the educational fund, and the sinking-fund. The *Familistère* is organized like a great family. It has its buildings for habitation, baking-house, steward's office, nursery, schools, pension bank, and insurance office. In 1888 the corporation had 13 *associés*, 67 *sociétaires*, and 52 *participants*, out of 1,237 employees. The industry carried on is the making of stoves, ovens, and smaller hardware. There are three big buildings with 1,800 inhabitants, each family having two or three rooms. Each building encloses an interior court, covered with a glass roof and paved with cement. The building is four stories high. The stores of the association on the lowest story of the central portion of the building contain whatever is necessary for ordinary need and comfort, without reference to luxuries. The social palace can accommodate 1,500 persons, who can do their marketing and shopping under covered galleries, without traversing more than 200 yards. Much attention is given to education. Babies can be left by their mothers in a *crèche* from 7 A.M. to 7 P.M. There is considerable social life. Godin died in 1888.

GODWIN, MARY WOLLSTONECRAFT: English educational reformer; born at Hoxton, a district of London, 1759. Forced early to earn her own living, she became governess in the family of Lord Kingsborough, in Ireland. She soon resolved to devote herself altogether to literary work, and began to translate from the French. In 1792 appeared her best known work, "A Vindication of the Rights of Woman." Her book was mainly a plea for equality of education, for State education, and for the joint education of the sexes. It was a strong protest against the assumption that woman was only the plaything of man; and

she asserted that intellectual companionship was the chief and lasting happiness of marriage. She daringly dealt with dangerous questions, incidentally upheld greater freedom of divorce, and denied the eternity of the torments of hell. Having great sympathy with the ideas back of the French Revolution, she went to Paris and remained there during the Reign of Terror. In 1796 she was married to William Godwin, and died in giving birth to a daughter, who became the wife of the poet Shelley.

GODWIN, WILLIAM: English clergyman and writer; born at Wisbeach, Cambridgeshire, 1756; son of a Nonconformist minister. Educated for his father's profession, he was at first more Calvinistic than his teachers, becoming a Sandemanian, of which sect he says that they were the followers of "a celebrated north-country apostle, who, after Calvin had damned ninety-nine in a hundred of mankind, has contrived a scheme for damning ninety-nine in a hundred of the followers of Calvin."

Acquaintance with French revolutionary thought led Godwin to exchange the pulpit for the pen, and he removed to London to engage in literature. His first work, "Historical Sketches," met with no success, and he was reduced to penury and despair; but through his work he became acquainted with Fox, Sheridan, and other Whig leaders, and he turned his attention to politics. The American Revolution, closely followed by that of France, excited the public mind, and in 1793 Godwin wrote his "Inquiry Concerning Political Justice." This was followed by "The Adventures of Caleb Williams," a remarkable novel, intended to illustrate his political views.

In 1796 Godwin married Mary Wollstonecraft. Since both held the same views regarding the slavery of marriage, and since they only married at all for the sake of possible offspring, the marriage was concealed for some time, and the happiness of the avowed married life was very brief. Mrs. Godwin died in giving birth to a daughter, afterward the second wife of Percy Bysshe Shelley. The cares of a family led him to contract a second marriage with Mrs. Clairmont in 1800.

Godwin wrote school-books; an admirable "Life of Chaucer" (1801); "Fleetwood," a novel (3 vols., 1803); "Mandeville" (1817); a "Treatise on Population," a refutation of Malthus (1820); a "History of the Republic of England" (4 vols., 1824-28); "Cloudesley" (1830); "Thoughts on Man" (1833). As he grew old, he modified his opinions on politics and society, and especially on marriage, which he warmly commends in some of his later works. He was appointed to a government position, but continued to write, "Deloraine," a novel, and "Lives of the Necromancers" being among his latest works. Many of his books were translated into foreign languages. He died in London in 1836.

Godwin was an intense individualist, holding that all control of man by man was wrong, and that government must disappear. But all was to be done by discussion, and matured change resulting from discussion. His "Political Justice" almost created the English radicalism of the early part of the century, and led to the milder liberalism of to-day. In it he maintained that natural relationship had no claim on man, nor was gratitude to parents or benefactors any part of justice or virtue. Property was to belong to him

who most wants it; accumulated property was a monstrous injustice. Hence marriage, which is law, is the worst of all laws, and property the worst of all properties. His life was published in 1876 in two volumes, under the title "William Godwin, His Friends and Contemporaries."

GOEHRE, PAUL: Socialist writer; born April 18, 1864, at Wurzen, Saxony; studied theology at Leipsic, 1885-88; became assistant pastor at Schönbach and Löbau; was at the same time associate editor of the *Christliche Welt*. Deeply interested in social and industrial conditions, he entered a factory at Chemnitz as a common laborer in the spring of 1890. He later described his experiences in a book, "Drei Monate Fabrickarbeiter und Handwerksbursche" (Three Months in a Factory), 1891; he went then to Berlin to study political economy, and became (1891) general secretary of the Evangelical Social Congress, and while in this office he conducted an inquiry into the condition of agricultural laborers. In 1894 he became pastor of a church in Frankfort-on-the-Oder, where he had mostly working men in his congregation. He resigned in 1897, and was with Naumann (q. v.) one of the founders of the National-Sozialen Party (q. v.), but disagreed with its tendency, and joined the Social Democrats in 1899. He was elected to the Reichstag in 1903, but resigned owing to attacks made on him by some of the members of the party. Author: "The Evangelical Social Movement: Its History and Aims," 1896; "How a Clergyman Became a Socialist," 1900; "Socialism and Liberalism," 1902; "Recollections of a Workingman," 1903.

GOLD AND SILVER: The color, luster, and power of resisting oxidation possessed by gold have caused it to be considered a precious metal from the earliest times. Allusions to gold are frequent in the Jewish Scriptures and in classical writings. Jewelry and vessels found in Egyptian, Greek, and Trojan tombs show the perfection attained in working gold, while the value attached to it is shown by its being used in religious worship and in its being chosen by the poets to describe the glory of the gods.

I. Supply of Gold

The ancient supply of gold seems to have come from Eastern Africa, and around the sources of the Indus. In the times of the Romans gold does not seem to have been so abundant, tho gold was worked near Apulia and in Spain. After the discovery of America it was brought in large quantities from Mexico, Brazil, and other South American countries. Between 1829 and 1838 it was found in Siberia and largely exported. The great gold-fields of California were discovered in 1848, by accident, by a Mr. Marshall, who found particles of gold-dust in a mill-race on the estate of a Captain Sutter. It led to intense excitement.

In Feb., 1851, the gold-fields of Australia were discovered near Bathurst by a Mr. Hargraves, and this led to a series of discoveries, and a rush to Australia (q. v.). Gold was discovered in South Africa in 1867, but the great gold-mines of the Transvaal were not actively worked till the early eighties, since when they have grown into a leading position. The most famous gold-mines of

Europe are those of Hungary and Transylvania. The great Alaskan discoveries and the rush to the Klondike began in 1897.

The greater part of the gold of the world is obtained by washing from detrital deposits along the beds of rivers; a smaller quantity is obtained by crushing and washing quartz.

II. Silver

Silver, like gold, has been known and prized from the earliest ages. Phidon, King of Aegina, is said to have struck coins in silver B.C. 860. Silver currency was adopted by the Romans in 269 B.C. It was largely used by Greek and Roman artists. The silver-mines of Mexico were, however, until quite recently, by far the richest known to exist. Until the remarkable discoveries of silver ore in Nevada and adjoining states in 1859 and 1860, Chile and Peru had long stood next to Mexico in their yield. Bolivia is also rich in silver. Of European countries, Spain is the most productive.

The great silver-mining industry of the U. S. had no existence before 1860. The prospectors and pioneers who traversed Arizona, Idaho, Nevada, Colorado, seeking for gold, in the years between 1850 and 1860, fell upon silver unexpectedly. The greatest silver-mine ever known was discovered in this way in 1858-59, on the eastern foot-hills of the Sierra Nevada. This was the celebrated "Comstock" mine, which was found by James Shinney and Henry Comstock, who parted with their interests for a trifle, not knowing its value. A portion of the mine was worked in 1860-61, and by 1865 it had yielded the value of \$30,000,000; and a city of 20,000 inhabitants was planted on its site. Idaho and Montana became silver-bearing territory. Up to 1879 the value of the silver yield of Colorado was about only \$16,000,000. Two years later the mines of Leadville, alone, not discovered till 1877, yielded as much.

III. Statistics

All the statistics, except as stated, are from the report of the Director of the U. S. Mint (1906):

In the calendar year 1905 the world produced 18,243,911 fine ounces of gold of the value of \$377,135,100, exceeding 1904 by 1,453,560 fine ounces, or \$30,047,800, equivalent to 8.6 + per cent.

The greatest increase, 1,326,312 fine ounces, was in Africa, which was followed by the U. S. and Mexico, with 373,262 and 169,400 fine ounces, respectively. The largest decrease was in Russia.

The great producing countries were Africa, 5,482,296 ounces; the U. S., 4,265,742 ounces; Australasia, 4,156,692 ounces; Russia, 1,078,356 ounces; Mexico, 779,181 ounces; Canada, 700,800 ounces; and British India, 563,817 ounces. The British Empire leads with over 11,000,000 ounces, or about 60 per cent of the total. The U. S. produced 23 + per cent.

The world's product of silver in 1905 amounted to 167,727,934 fine ounces, of the commercial value, at 61 cents per ounce—the average price in New York in that year—of \$102,314,000, an increase in production of 3,391,526 fine ounces over 1904, and an increase in value, owing to the rise in price of 3 cents per ounce, of \$6,998,900.

Mexico held the first place with 65,040,865 fine ounces; the U. S. following with 56,101,600

ounces. The remaining large producers were Australasia, 12,561,600 ounces; Canada, 5,974,875 ounces; Germany, 5,820,947 ounces, and Peru, 5,169,659 ounces.

The commercial value of the world's production of the precious metals in 1905 was \$479,449,100, an increase as compared with the value of the yield of 1904 of \$34,890,600.

1. PRODUCTION OF GOLD AND SILVER IN THE U. S., 1905

| STATE OR TERRITORY | GOLD | SILVER | Total value (silver at commercial value) |
|---------------------|--------------|------------------|--|
| | Value | Commercial value | |
| Alabama..... | \$41,500 | \$183 | \$41,683 |
| Alaska..... | 14,925,600 | 103,212 | 15,028,812 |
| Arizona..... | 2,691,300 | 1,589,477 | 4,280,777 |
| California..... | 19,197,100 | 660,020 | 19,857,120 |

| Total... | \$1,933,498,014.50 | \$607,259,120 | \$169,029,376.34 |

3. PRODUCTION OF GOLD AND SILVER IN THE WORLD

(From 1493 to 1885 is from a table of averages for certain periods, compiled by Dr. Adolph Soetbeer; for the years 1886 to 1905 the production is the annual estimate of the Bureau of the Mint.)

| PERIOD | GOLD | | SILVER | |
|------------------------|---------------------------|------------------|---------------------------|------------------|
| | Annual average for period | | Annual average for period | |
| | Fine ounces | Value | Fine ounces | Coining value |
| 1493-1590..... | 186,470 | \$3,855,000 | 1,511,050 | \$1,954,000 |
| 1591-44..... | 230,194 | 4,759,000 | 2,899,930 | 3,740,000 |
| 1545-60..... | 273,590 | 5,656,000 | 10,017,940 | 12,952,000 |
| 1561-80..... | 259,906 | 4,546,000 | 9,628,925 | 12,450,000 |
| 1581-1600..... | 237,267 | 4,905,000 | 13,467,635 | 17,413,000 |
| 1601-20..... | 273,918 | 5,662,000 | 13,596,235 | 17,379,000 |
| 1621-40..... | 266,845 | 5,516,000 | 12,654,240 | 16,361,000 |
| 1641-60..... | 281,955 | 5,828,000 | 11,776,545 | 15,226,000 |
| 1661-80..... | 297,709 | 6,154,000 | 10,834,550 | 14,008,000 |
| 1681-1700..... | 346,095 | 7,154,000 | 10,992,085 | 14,212,000 |
| 1701-20..... | 412,103 | 8,520,000 | 11,432,540 | 14,781,000 |
| 1721-40..... | 613,422 | 12,681,000 | 13,803,080 | 17,924,000 |
| 1741-60..... | 791,211 | 16,356,000 | 17,140,613 | 22,162,000 |

5. COINAGE OF NATIONS OF THE WORLD

| CALENDAR YEAR | Gold | Silver |
|---------------|---------------|---------------|
| 1903..... | \$240,499,547 | \$211,795,829 |
| 1904..... | 455,427,085 | 176,508,646 |
| 1905..... | 245,954,257 | 103,880,205 |

IV. Ratio of Gold to Silver

The columns showing the amount of silver produced to one unit of gold in dollars and in ounces were prepared by Mr. George B. Waldron, down to 1894.

For purposes of comparison are added Dr. Soetbeer's estimates of the commercial ratio of gold to silver down to 1832, the estimates of Pixley and Abell from 1833-78, and those of the Director of the Mint from 1879-94. Variations between the highest and lowest ratios of each period are given in the next column from 1687-1894, based on daily London quotations beginning with 1833.

The question of the relative value of gold and silver and the currency problems arising from this have long been among the burning economic questions of modern times. We give here only tabular statements of the facts for all discussion of them, referring the reader to articles: BIMETALLISM; CURRENCY; CONTRACTION AND EXPANSION OF CURRENCY; MONEY.

The facts seem to be as shown in the following tables.

For the ratio since 1904 see tables 3, 4 and 5.

The commercial ratio of gold to silver, from the time of Herodotus (born 484 B.C.) down to the year 1717, is shown in the following from the letter of Lord Liverpool to the King of England (see "Coinage Laws of the U. S.," 1894, p. 435):

| | |
|---|---------------|
| In Persia, according to Herodotus..... | 1 to 12½ |
| In Greece at same period..... | 1 to 13 |
| In Greece in the time of Plato..... | 1 to 12 |
| In Greece it is stated by Xenophon at..... | 1 to 10 |
| After the plunder of gold from the Temple of Apollo, according to Menander, it was..... | 1 to 10 |
| In the reign of Alexander the Great it was..... | 1 to 10 |
| In Rome, according to Pliny the Elder..... | 1 to 10½ |
| In Rome, after the tribute from the Etruscans..... | 1 to 10 |
| The plunder of gold from the Gauls by Julius Cæsar reduced the proportions to..... | 1 to 7½ |
| In the reign of Claudius, Tacitus states it at..... | 1 to 12½ |
| Until the reign of Alexander Severus it contained..... | 1 to 12½ |
| In the reign of Constantine the Great..... | 1 to 019 |
| The disorders in the Roman Empire under Arcadius and Honorius raised it to..... | 1 to 14½ |
| From which it appears that gold, unless when deprect by sudden and unusual occurrences, or enhanced by a dread of public insecurity, may be stated to have been for upward of 900 years in the proportion of..... | 1 to 10 or 12 |
| England, under Henry III., 1216 to 1272..... | 1 to 9½ |
| England, under Edward III., 1330 to 1377..... | 1 to 12½ |

| | |
|---|------------|
| In England, in the reign of Henry IV., 1400 to 1412..... | 1 to 10½ |
| In England, in the reign of Edward IV., 1461 to 1477..... | 1 to 11½ |
| In England, in the reign of Henry VIII., 1510 to 1547..... | 1 to 11.10 |
| In England, in the reign of Queen Elizabeth, 1560..... | 1 to 11 |
| In England, in the reign of King James I., 1604..... | 1 to 12½ |
| In England, in the reign of King James I., 1611..... | 1 to 13½ |
| In England, in the reign of Charles II., 1665..... | 1 to 14½ |
| In England, in the reign of George I., 1717..... | 1 to 15½ |
| Relative proportions in China, according to Humboldt..... | 1 to 12½ |
| Relative proportions in Japan, according to Humboldt..... | 1 to 8½ |
| Relative proportions in Bengal, according to bullion report..... | 1 to 14.86 |
| Relative proportions in Madras, according to bullion report..... | 1 to 13½ |
| Relative proportions in Bombay according to bullion report..... | 1 to 15 |
| In the China Diaries it is stated at 16 taels of silver to 1 tael of gold of 100 touch of pure gold. If it is meant to be of pure silver also, the proportion would be 1 to 16; but it is believed to be the average fineness of silver in dollars, which would be..... | 1 to 14.96 |

REFERENCES: SEE CURRENCY.

GOLDMAN, EMMA: Communist Anarchist; born 1869, near Kovno, Russia; educated in St. Petersburg and Königsberg (Prussia). She became acquainted with modern revolutionary ideas at an early age, in Russia, and joined the ranks of Communist Anarchists in America. She has been an active anarchist for about twenty years. She served one year in prison at Blackwell's Island, N. Y., for addressing an outdoor meeting of the New York unemployed, in 1893, and was arrested in Chicago, in 1901, together with a number of other anarchists, on the charge of conspiracy with Czolgosz, but discharged in the police court. Delegate from America to the International Anarchist Congress at Paris, 1900, and to the Amsterdam (Holland) Congress, 1907. Publisher of a monthly magazine devoted to social science and literature, *Mother Earth*. Address: 210 East Thirteenth Street, New York City.

GOLDSTEIN, MISS VIDA: Australian woman suffragist; born in Portland, Victoria. She is president of the Woman's Political Association of Victoria, secretary of the United Council for Woman's Suffrage, and a member of the executive committees of the National Council of Women of Victoria, of the Criminology Society, and of the Royal Victorian Trained Nurses' Association. She has spoken on woman suffrage before the United States House of Representatives and Senate committees, and was the representative for Australia and New Zealand at the International Woman's Suffrage Conference held in Washington in 1902. Miss Goldstein was the first woman candidate for Parliament in the British Dominions (December, 1903). She is the editor and proprietor of *Woman's Sphere*. Address: Oxford Chambers, Bourke Street, Melbourne, Victoria.

GOMPERS, SAMUEL: American labor leader; president of the American Federation of Labor; born in London, England, 1850; apprenticed to a shoemaker at the age of ten; obtained his education after working-hours. He later became a cigarmaker and came to the United States in 1863. Joining the cigarmakers' union he soon became prominent in its councils and served as president of Union 144 for six years, during which time he was repeatedly elected delegate to the conventions of the Cigar Workers' International Union, the constitution and development of which are largely the results of his efforts. He was one of the founders of the AMERICAN FEDERATION OF LABOR, was elected its first president, 1882, and has been reelected every year since except in 1895, when he was defeated because of his opposition to the endeavors of the Socialist Party to capture the federation.

Mr. Gompers has repeatedly declined election or appointment to important and remunerative political and other offices, and has devoted his every energy to upbuilding the trade-union movement. For this he has worked unremittedly, traveling over the whole country. During the first six years of his official duty he received no salary nor any other emolument. In the eight-hour struggle of 1886 he paid his entire expenses and worked night and day for many weeks. He is not opposed to the aims of socialism, tho not committed to its views, and he believes in political action on the part of Labor, but holds that the main hope of Labor is in the trade-union movement and that to commit that movement to any political party or endeavor would be to disrupt it

and hurt it irremediably. Mr. Gompers has been editor of the federation's organ for thirteen years, is vice-president of the National Civic Federation, and has written numerous tracts and magazine articles on labor subjects. Address: 423 G Street, Washington, D. C.

GOOD GOVERNMENT CLUBS: The establishment of "good government clubs," the object of which is explained by their name, began with the formation of the City Club in New York, April 13, 1892.

The failure of the Municipal League to elect its candidate to the mayoralty in 1891 occasioned profound discouragement among those desirous of obtaining good city government. It seemed to indicate that mere popular indignation or enthusiasm could not be counted upon when pitted against an organized political machine. It became clear, therefore, that if the work of improving city government was to be undertaken at all, it must be undertaken upon a permanent plan—a fact which suggested the organization of a social club which would serve to bring together and to keep together all those interested in good government. The City Club was established, largely owing to the efforts of Mr. Edward Kelly. One of its chief activities was to establish other local clubs, which were called good government clubs, and have been very successful. More recently, however, the name "Good Government Club" has been less used. (See MUNICIPAL REFORM.)

GOOD TEMPLARS, INDEPENDENT ORDER OF: The Independent (International) Order of Good Templars originated in Utica, N. Y., in 1851. Its platform is total abstinence for the individual and prohibition for the State. It was the first secular organization in the world to admit woman upon equal terms with man, and its attitude in this respect has been a very material help to all movements looking to the advancement of woman. For the first seventeen years of its existence the order was confined to the United States and Canada. It spread all over North America, numbering hundreds of thousands of members; and many of the laws dealing with the liquor traffic in the different states and provinces are the result of its work. The order has also been largely instrumental in originating other movements, such as the Woman's Crusade, the Woman's Christian Temperance Union, and the Prohibition Party.

In 1868 Good Templarism was introduced into England and Scotland, and somewhat later into Ireland and Wales. There are very strong bodies in these countries; and in the British Isles, as in North America, the order has had a great influence in shaping legislation. Rather more than a quarter of a century ago the Good Templar Order was carried to Scandinavia, where it immediately took root, and has made the most astonishing progress. The grand lodge of Sweden is now the largest organization in the world, having about 125,000 members. Norway and Denmark have also large grand lodges in proportion to their population. In Iceland about one in seven of the population is a member of the order.

Within about fifteen years after its foundation, the order reached Germany, where it is rapidly becoming a tremendous power, already counting a membership of about 40,000. It publishes several newspapers, and owns a number of halls, hotels, and restaurants. Smaller organizations

exist in Belgium, Holland, and Switzerland; and, quite recently, beginnings have been made in Hungary and Rumania. For many years Good Templar grand lodges have been maintained in all the Australian states and in New Zealand. Four grand lodges, each having several thousand members, are to be found in South Africa. A remarkable work is going on among the natives on the Gold Coast and in other parts of Africa. There are three grand lodges in India, where some of the work is carried on in the vernacular, and there are lodges, some of them using the Spanish language, in different parts of South America and the West Indies.

A feature of the order's work is that carried on among the soldiers and sailors of Great Britain. A large proportion of the British war-ships have lodges on board, holding regular meetings; and a majority of the regiments of the British army have also their Good Templar organizations. Wherever the order has gone it has enrolled children as well as adults, and it now has a juvenile membership of about a quarter of a million. The number of grand lodges in the world is now 70, with a total membership of 407,645. *International Secretary*, Col. B. F. Packer, Milwaukee, Wis.

GORKI, MAXIM (pen-name of **Aleksei Maksimovich Pyeshkov**): Russian social writer and novelist; born 1868 at Nijni-Novgorod. He was successively a shoemaker's apprentice, scultery-boy, baker, ship's cook, porter, gardener, painter of ikons, lawyer's clerk, tramp, and finally writer. As a tramp he journeyed over large portions of the empire, and his idealistic yet realistic novels are largely based on his experiences with the working and vagrant classes, whose thoughts and social conditions he has brilliantly interpreted. His novel "Makar Choudra" (1892) was the first of a large number among which "Foma Gordye'eff" is probably the best known outside of Russia. Other works are "Chelkash"; "Song of the Falcon"; "Song of the Petrel"; "The Orloff Couple and Mava"; "Troye"; "About the Devil"; "More About the Devil"; "The Reader"; "The Outcasts" (1902); "Three Men" (1902). Gorki has visited other countries (the United States in 1906), writing and lecturing, largely on social themes, and voicing the socialistic radicalism of the Russian and other working classes. *Address*: Arsemas, Nijni-Novgorod, Russia.

GOSMAN, ALEXANDER: Australian clergyman; born at Craik, Fife County, Scotland, 1829; educated in public schools and at the University of Glasgow; degree of D.D. conferred upon him by St. Andrew's University in 1904. In 1864 he was appointed professor of theology in the Congregational College of Victoria, and in 1876 became its principal. Since 1879 he has been minister of the Augustine Congregational Church at Hawthorn, near Melbourne, Victoria. Mr. Gosman is chairman of the Victorian Congregational Union, and was a delegate to the first and second International Congregational Councils, London, 1891, and Boston, 1899. He was chairman of the Wages Board and president of the Antisweating League from 1895 to 1902. *Address*: Burwood Road, Hawthorn, Victoria.

GOTHENBURG. See NORWEGIAN COMPANY SYSTEM.

GOUGH, JOHN BARTHOLOMEW: American temperance lecturer; born at Sandgate, Kent,

England, 1817; son of a pensioner of the Peninsular War and a village schoolmistress. At the age of twelve he went to America and worked on a farm in Oneida County, N. Y. In 1831 he went to New York City, where he found employment in the binding department of the Methodist book establishment; but habits of dissipation lost him this employment, and reduced him to that of giving recitations and singing comic songs at low grog-shops. He was married in 1839; but his drunken habits reduced him to poverty, and probably caused the death of his wife and child. A benevolent Quaker induced him to take the pledge; and he attended temperance meetings and related his experience with such effect as to influence many others.

Gough later became a prominent advocate of the temperance cause. After ten years of great success as a temperance lecturer he went to England in 1853 and carried on a remarkable work there. He returned to the United States in August, 1860, and soon began to lecture on "Street Life in London." Other subjects were added to his list, and in all he retained his great popularity. In 1873 he announced that he would retire from the lecture field, but he was afterward prevailed upon to appear on special occasions. In 1878 he again visited England. In 1869 he issued his "Autobiography and Personal Recollections," and in 1880 "Sunshine and Shadow," being chiefly passages from his lectures. He died in Philadelphia, Pa., 1886.

GOULD, ELGIN RALSTON LOVELL: American economist and banker; born at Oshawa, Ontario, 1860; educated at home, at Victoria University, Coburg (now at Toronto), and at Johns Hopkins University. From 1884 to 1887 he was instructor in the Department of History and Political Economy in the Washington (D. C.) High School; in 1885 he conducted an official inquiry in Belgium and Germany for the Department of Labor, and in 1887 he became permanently connected with that department as a statistical expert. In 1887-88 he was reader in social statistics at the Johns Hopkins University, and in 1892 became resident lecturer there. He has represented the United States Government at various international congresses, and is a member of economic and statistical societies at home and abroad. In 1894 he became professor of statistics at the University of Chicago. Mr. Gould became president of the City and Suburban Homes Company (New York) in 1896, the purpose of this enterprise being to provide model homes and tenements for wage-earners. He is also president of the Thirty-fourth Street National Bank in New York.

Mr. Gould believes thoroughly in the application of the historical method and of statistics to economics, but does not accept the opportunism of some of the historical school. He believes in the gradual reduction of the tariff and in international bimetalism; he does not believe in the nationalization of natural monopolies, but thinks the municipalization of some of them might be carefully tried. Among his works may be mentioned: "Housing of Working People," "Popular Control of the Liquor Traffic," "The Gothenburg System of Liquor Traffic," and "The Social Condition of Labor." *Address*: 301 West Seventy-seventh Street, New York City.

GOURNAY, JEAN CLAUDE MARIE VINCENT, SEIGNEUR DE: French economist; born at

Saint Malo, 1712. Traveling as a merchant in Spain, Holland, and England, he published in France on his return a report on the economic and financial condition of these countries. Appointed *intendant du commerce* in 1851, his observation convinced him that the lack of development in French manufacturing was due to the various governmental restrictions, and he came thus largely tho not wholly to embrace the views of the *Physiocrats*, and became the author of the famous phrase, *Laissez-faire, laissez-passer*. He died in 1759.

GOVERNMENT: This term, which is derived from the Latin *gubernare* (to steer, direct, govern),

| Total Autocratic..... | 15,789,645 | 625,798,754 |

denotes the power vested in the State by which its affairs are conducted. Government may be of any form—monarchical, despotic, autocratic, aristocratic, plutocratic, democratic; it may be local, municipal, state, or national. (For the principles involved and the various forms of government, see ANARCHISM; DEMOCRATIC PARTY; FEDERATIONS; INDIVIDUALISM; REPUBLICAN PARTY; SOCIALISM; STATE; VOLUNTARISM, etc.).

Says Hamilton (*Federalist*, No. 15), "Why has government been instituted at all? Because the passions of men will not conform to the dictates of reason and justice without constraint." (For a discussion of this, see ANARCHISM; SOCIALISM; STATE.)

Republican government embraces 24.3 per cent of the area of the habitable world, and 11.4 per cent of the world's population. Constitutional government (not republican) embraces 17.2 per cent of the area, and 18.5 per cent of the population. Colonies or dependencies without self-government embrace 27.3 per cent of the area, and 31.4 per cent of the population. Autocracy embraces 31.1 per cent of the area, and 38.8 per cent of the population.

GRANGERS: An association of American agriculturists commonly known by this name, tho formerly called Patrons of Husbandry.

Soon after the close of the Civil War, President Johnson sent O. H. Kelly, an employee of the Department of Agriculture, as an agent into the Southern States to investigate the condition of the farmers in that section of the country and to report the result of his observations. He was so seriously impressed with what he saw that he proposed a national association of farmers, with branches in all sections of the country. On Dec. 4, 1867, the National Grange was organized with Mr. Kelly as secretary.

It was to be divided into national, state, and subordinate assemblies or "granges." Women were to be admitted to membership on equal standing with men. The purposes of the order were two—the industrial benefit and the social improvement of its members. The discussion of any political question was strictly forbidden. This was found difficult, but its leaders have been successful in the main in keeping it out of politics, and it is different in this respect from the other farmers' organizations. (See FARMERS' ALLIANCE.)

Up to the close of 1871 there were but about 200 granges organized, while the national grange contained only its seven original members. From this time forward its progress was rapid. The farming population began to perceive the advantages of the association, and grew as enthusiastic as they had been lethargic. At the close of 1875 there were about 30,000 granges in existence, said to average about forty members each, the order being strongest in the West and Northwest and well represented in the South. By this time, however, its climax of prosperity had been reached. Jealousy arose between the subordinate and the national granges, and parties with no interest in agriculture beyond that of selling goods to the farmers made their way into the order. So far was this carried that one grange was organized on Broadway, New York City, with forty-five members, representing capital of perhaps as many millions, and composed of bank presidents, wholesale dealers, sewing-machine manufacturers, and speculators. The result of all this was a great

depression of the order. Nevertheless, the order endured, and has had no little influence. It is said to have organized 30,000 subordinate groups in forty-four states and territories. It claims to have prevented the renewals of patents on sewing-machines; to have taught transportation companies that the creator is greater than the creature; to have passed and enforced oleomargarine laws, laws restricting alien landlords and corporations, the interstate commerce law, ballot reform laws, the making the Secretary of Agriculture a cabinet officer, establishing agricultural colleges and stations, arbor days, public schools, numerous local institutions.

Cooperation has been much favored by the Grange, and numerous experiments have been tried, but without great success. (See COOPERATION.)

The following legislation, according to the *World Almanac*, 1907, is favored by the National Grange:

1. Free delivery of mails in the rural districts be placed upon the same permanent footing the delivery of mails in the cities and the appropriations to be commensurate with the demands and the benefits of the service.
2. Postal savings-banks.
3. Election of United States senators by direct vote of the people.
4. An amendment to the Constitution granting the power to Congress to regulate and control all corporations and combinations.
5. Enlargement of the powers and duties of the Interstate Commerce Commission, giving it authority to determine what changes shall be made or what practices are discriminative or unreasonable, and their findings to be immediately operative and so to continue until overruled by the courts.
6. Regulation of the use of shoddy.
7. Pure food laws.
8. Extension of the markets for farm products equally with manufactured articles.
9. An antitrust law, clearly defining what acts on the part of any corporation would be detrimental to public welfare.
10. The speedy construction of a ship canal connecting the Mississippi River with the Great Lakes and the Great Lakes with the Atlantic Ocean.
11. Revision of the fees and salaries of all federal officers, and placing them on a basis of similar service in private business.
12. Parcels post, telephone and telegraph in the mail service.
13. National and state aid to improve the public highways.

Master, N. J. Bachelder, Concord, N. H.; Secretary, C. M. Freeman, Tippecanoe City, Ohio.

GRAYSON, VICTOR: Member of Parliament for Colne Valley, division of Yorkshire, July, 1907; the first man in the United Kingdom elected simply as a Socialist; born 1881 at Liverpool; became an engineer's apprentice, and studied life as a stowaway and tramp; he matriculated at the Liverpool and Manchester universities with a view to entering the Unitarian ministry, but abandoned this, went to live in a Manchester slum, and earned his living as a journalist and lecturer. Gaining popularity among the workers in the Colne Valley, he was selected as candidate for Parliament, and adopted by the Independent Labor Party (*q. v.*), but not by the Labor Party (*q. v.*). He defeated Philip Bright (Liberal—son of John Bright) by 153 votes, and a Conservative by 421. The fact that a Socialist could defeat both the old parties without the formal support of the Labor Party, created a great sensation throughout the United Kingdom.

GREAT BRITAIN (see also **BRITISH EMPIRE**; **IRELAND**; **SCOTLAND**): In this article we simply outline British social reform to bring out the continuity, referring for all statistics and details to special articles.

The story of social reform in England begins with Alfred's efforts at establishing justice and promoting learning, if not with Augustine and with Aidan. The early English Church and some of England's kings struggled to put down slavery. Englishmen like Anselm and Theobald withstood Norman oppression. In 1215 the knights at

Runnymede, led by Stephen Langton, Archbishop of Canterbury, won from King John the Great Charter, with its fundamental rights, freedom from imprisonment without trial, and from taxation without consent of the council of the nation. In 1265 Earl Simon of Montfort, for Henry III., summoned the burgesses to Parliament, and under Edward I. they came, reasserting the old rights of the Anglo-Saxon Witenagemot.

As early as 1360 did John Ball (*q. v.*), "the mad priest of Kent," preach a medieval Christian socialism, asking in the name of the common folk by what right men called lords were greater folk than they, and declaring that the lords held their estates by the toil of the villeins. The Peasants' Revolt (*q. v.*) resulted and was put down, yet serfdom was conquered and the spirit engendered has never wholly died away. One finds

Beginnings

it alike in the rough poetry of Langland's "Piers Plowman" (1377) and in the courtly words of More's "Utopia" (1516). It enters in milder form into Erasmus's "Christian Prince," and again in Harrington's "Oceana" (1656). It is voiced in Beller's proposed "College of Industry" (1695), and in Spence's land nationalization of 1775. (See these names.) England, freed from serfdom, enjoyed what some called the "Golden Age" of Merrie England.

But after the Golden Age came the Iron. In the sixteenth century the nobles, impoverished by the long French wars and the wars of the Roses, drove out many of their humble folk, and turned their fields into sheep walks for the raising of wool for the Flemish market, and at the same time fenced in many of the commons, calling forth continual protest, including Latimer's sermons. This robbery of the land by those who were its rulers but not its owners, together with the confiscation of the monasteries and other causes, produced the landless class (see **LAND**), and made necessary the poor-laws (*q. v.*). These laws, altho turned by remorseless magistrates into a means of the degradation of England's poor, contained, nevertheless, the socialistic claim of the right of every man to receive opportunity for life and work from the State.

The contest with Charles, the Puritan Commonwealth, the English Revolution, were not movements of the industrial classes, but they laid the foundation of England's political democracy and made possible the England of to-day. (See **LEVELERS**.)

When, in the eighteenth century, the discovery of steam-power and machine production developed modern industrial England, it caused an economic revolution. Under the *laissez-faire* teachings of Adam Smith, trade threw off restraint; manufacturers robbed cottages of their women and cradles of their children to employ them in factories utterly without sanitation, coining their blood into profits. Employees were worked like slaves and housed more poorly than the beasts, the whispers of Malthusianism quieting any stirrings of the conscience. It was necessary that men be killed, it was said; there was not room for all. It was these conditions that led to modern industrial legislation.

In 1795 Dr. Aikin, a Manchester physician, published a statement concerning the evil condition of the children working in the mills. In 1796 a committee was formed in Manchester to inquire into the health of the poor. In 1802 the elder Peel brought in and passed the

first bill for the preservation of the health and morals of apprentices and of others employed in cotton and other factories. It immediately accomplished nothing, being fatally defective; but it established the principle. Other bills introduced did little more. In 1824 a bill was passed, mainly owing to the

Early Factory Legislation

efforts of Francis Place, outside of Parliament, and Joseph Hume within, giving trade-unions, which had secretly existed since about 1700, the right to partially organize. In 1830 Richard Oastler, speaking for the antislavery movement, discovered that there was "white slavery" in England, and from that date gave his time and strength in poverty, and even when imprisoned for debt, to exposing the facts of factory evils, and agitating for legislation. He accomplished little, however, till Lord Ashley, afterward the Earl of Shaftesbury, took up his cause. T. Sadler, in 1831, had moved a ten hours' bill, but to no effect. A select committee was appointed in the matter in 1832, but only to gain time and prevent action. Lord Ashley, however, now taking hold, brought in a ten hours' bill for women and children, which was read a second time in 1833. It was violently opposed, especially by individualist Liberals like Cobden and John Bright. Finally, Lord Althorp brought in for the government and carried a compromise bill, which was better than nothing. Oastler, however, continued his agitation. Children's Employment Commissions of 1842 and 1843 published terrible revelations. A factory act was passed in 1844, and finally the Ten Hours' Bill of 1847.

Meanwhile Robert Owen (*q. v.*), at his mills in New Lanark, had been putting in practise various reforms, and in the year 1817 laid a scheme of a socialistic community before the House of Commons. This act is sometimes considered the beginning of socialism in England; but it was not socialism as we understand the word to-day. Owen's utopianism and evolutionary social democracy in industry have little in common. In 1825 Owen purchased New Harmony in the U. S. and started a short-lived community. In 1835 he founded an association of all classes of all nations; and during the discussions which arose over this, the words "socialism" and "Socialist" seem first to have been used.

The passage of the Reform Bill in 1832 had abolished the "pocket boroughs" and given England a taste of democracy. Slavery (*q. v.*) was abolished in the British colonies in 1834. The poor laws were reformed. The middle classes were now indeed enfranchised, but these reforms did little for the workmen. These Owen reached. The Owenite press, the *Crisis*, the *Pioneer*, the

The Owen- ite Period

Herald of the Rights of Industry, and other papers, created a wide-spread movement. Within a few weeks half a million members are said to have joined Owen's Grand National Consolidated Trade-Union, including tens of thousands of farm laborers and women. The object was to put an end to all competition. The wealthier classes were alarmed. In 1834 six Dorchester laborers were sentenced to seven years' transportation for the mere act of administering an oath. (See CONSPIRACY LAWS.) Monster labor congresses were held; 30,000 persons took part in a procession in London protesting against the judgment; over 250,000 signed a petition. Strikes were numerous. They generally failed, however. A

levy of 18*d.* per member hurt the Grand National. It was too hurriedly organized, and did not endure. The trade-unions all suffered. Led by William Cobbett, William Lovett, and others, working men began to turn to political methods.

In 1838 a representative meeting of workmen drew up a program of political reforms which they held to be necessary. Speaking to the representatives, the Irish orator O'Connell called it their charter, and in all the subsequent agitation this program was called the "People's Charter," and its supporters "Chartists." (See CHARTISM.) The charter called for the famous "six points"—manhood suffrage, equal electoral districts, vote by ballot, annual parliaments, abolition of property qualification for members of the House of Commons, and payment of members of Parliament for their services. Enormous meetings were held. Orators, writers, editors, poets were developed—O'Connor, Lovett, Cleave, Hetherington, and O'Brien being among the leaders. Every center had its Chartist journal. But there soon developed a division as to the means to be adopted. Some favored an appeal to force; many—probably most—advocated constitutional methods. In June, 1839, a petition signed by nearly 1,300,000 persons was presented to the House of Commons, "bound in iron hoops, four men bearing it," asking that the charter be considered. By a large majority the House of Commons refused. Relations between the government and the people became strained; public meetings were forbidden; riots were of frequent occurrence. Agitation continued more

Chartism

or less vigorously until 1848, the year of revolutions. A meeting was called on Kennington Common for April 10th, at which it was expected that half a million workers would be present. Great alarm prevailed; the military under the Duke of Wellington was called out; cannon were planted to cover the meeting-place and the exits, and nearly 200,000 civilians were enrolled as special constables. After all these threatenings the gathering on the common was not as large as had been anticipated, a heavy storm interfering. Not 100,000 were present. This was the end of Chartism. The movement collapsed when apparently at its highest. During all the ten years of the agitation it had been largely an economic change that was desired. Political change was only sought in order to secure economic changes. Every constitutional means had been tried and had failed, and now the government had shown that if an appeal were to be made to force, it would use all its strength to crush the appeal, and would yield no quarter. Just while men were pondering the alternatives, a new door of escape was opened—gold was discovered in America, and New Zealand and Australia were calling for colonists.

The repeal of the corn laws in 1846, after the long free-trade agitation of Cobden and Bright, and the passage of the Ten Hours' Bill in 1847, also gave hope of relief.

The close of the Chartist agitation witnessed the birth of organized Christian Socialism (*q. v.*).

Christian Socialism

Charles Kingsley and Frederick Denison Maurice, clergymen of the Church of England, with E. Vansittart Neale, Thomas Hughes, J. M. Ludlow (see these names), organized a society under the avowed name of Christian Socialism. They published pamphlets and two

papers, and started some cooperative stores. Their papers were soon discontinued; their stores either failed or were swallowed up in the larger Rochdale cooperative movement; but their thought lived. Kingsley's bold denunciation of the soulless Manchester school of political economy and the deeper philosophy of Maurice are potent to-day.

From 1850-80 English trade-unionism was taking form and growing, with many ups and downs. The Rochdale cooperative movement, beginning in 1844, during this period made its phenomenal advance. The writings of Carlyle and of Ruskin struck strong blows against the orthodox political economy. In 1848 Mill published his "Political Economy." Henceforth political economy was no longer a dismal science of theories, but a discussion of how to meet practical industrial problems. Mill himself, in his "Autobiography," came to announce himself a Socialist. There were other radical forces at work. From 1849 to his death in 1883 Marx resided in London. In London, also, was Mazzini. Opposed to socialism, as it was presented to him, he really preached its deepest and most ethical ideas. As early as 1847 Marx and Engels, corresponding with a London society, turned this society into a communist league; and the following year published from Brussels the manifesto of the communist party. In 1862 a party of French working men visited the International Exhibition in London, getting into communication with English trade-unionists; on Sept. 28, 1864, the famous "International" (*q. v.*) was founded at St. Martin's Hall, London. It was not at first a socialistic organization. Its simple aim was to unite the working men of all countries. Naturally it took a different coloring with different nations. In England it meant little more than an attempt at international trade-unionism, and took no deep root.

Little as he intended it, the lectures in England of Henry George (*q. v.*), individualist as he proclaimed himself, seem to have been the occasion for the first crystallization in England of modern Socialist thought.

Socialism

According to Sidney Webb ("Socialism in England"), the coercive measures introduced by Mr. Gladstone's ministry against the Irish Land League had alienated many of the earnest Radicals from the Liberal Party. It became evident that Liberalism was not inconsistent with shameless international aggression in the interests of the officers and the bondholders. The neglect of English social questions became more and more pressingly felt. The "Democratic Federation" was founded in 1881, by H. M. Hyndman, Herbert Burrows, Miss Helen Taylor (stepdaughter of John Stuart Mill), and some others. The only distinctively Socialist proposal explicitly set forth in the first program of this organization was "nationalization of the land," placed ninth in the list; but it was from the first essentially a Socialist body, and it changed its name in 1884 to the "Social Democratic Federation" (*q. v.*). Men joined like William Morris, Tom Mann, John Burns, and others.

At the end of 1884, however, William Morris (*q. v.*) withdrew from the Federation, and with others formed the Socialist League. The grounds of secession were mainly personal, but the new society soon developed a policy of its own, standing for a more communistic and less governmental

conception of socialism. Publishing the *Commonweal* (1885), to which Mr. Morris gave brilliant contributions, it exerted no small influence. About 1892, however, the organization and the *Commonweal* came under anarchist control; Mr. Morris withdrew, and the league virtually died, the Social Democratic Federation keeping on.

A more potent and unique organization of English Socialists is the Fabian Society (*q. v.*), founded in 1883, and to-day still adding to its strength. Commenced mainly as an educational and propagandist center, it includes members of other societies. In one year its members have given thousands of lectures and distributed still more thousands of Socialist essays and tracts. It has influenced political parties, economic literature, and trade-union thought. It may almost be said to have created the London County Council (*q. v.*), and to have changed the thought of the working men's clubs of London. Leaders in it like Sidney Webb, Bernard Shaw, H. G. Wells, and others have had most respectful hearing, and many of its members have been elected to Parliament. (See *FABIAN SOCIETY*.)

These various societies, taking advantage of industrial depressions and discontent, have largely captured the English trade-unions for socialism. A "New Trade-Unionism" grew steadily till 1895. The agitation in behalf of the unemployed in 1886, resulting in the prosecution at the Old Bailey of Messrs. Hyndman, Burns, Champion, and Williams, led, although they were acquitted, to making socialism somewhat popular among the London masses. The great dock strike of 1889 saw a turning of the tide. Ben Tillett, Tom Mann, and John Burns organized the dock laborers and won. It led to the organization of other trades thus far unorganized. These

New Trade- Unionism

new unions followed the new leaders, and the movement began to grow in the rank and file of even the old unions. By 1890 the new unionism was in the majority in the trade congresses, and in 1894 voted to support only collectivist candidates. The defeat of the Liberal Party in 1894, however, to which many of the old trade-unionists were allied, led to the older trade-unions securing a change in representation, giving the newer trade-unions less power, and thus defeating the new trade-unionism at the Congress of 1895. Some of the new trade-unions, too, did not endure.

Labor representatives began to be elected to Parliament as Liberals or as miners' members. In 1873-74 no fewer than thirteen "labor candidates" went to the polls; and Alexander Macdonald and Thomas Burt (*q. v.*), two leading officials of the miners' national unions, were elected the first "labor members" of the House.

However, altho largely enfranchised by the Reform Bill of 1867, English workmen in their trades congresses even rejected amendments in favor of manhood suffrage as late as 1882 and 1883. In order to win legal recognition at all for their trade-unions, the leaders had had to plant themselves wholly on the middle-class ground of the individual freedom of each man to sell his labor as he pleased, collectively or not. Even after trade-unions were themselves in 1871 fully legalized, even when "in restraint of trade," their members were still so liable to prosecution under vague combination laws, that the unions were engaged in a battle for mere existence down to 1875. At this date, however, the Liberal Par-

ty having been defeated largely by the division of the labor vote, a Conservative government wiped away the last vestige of the combination laws. But this long struggle for life had so indoctrinated the trade-unions with the individualist economy, that, save for a few leaders like Allan of the Engineers and Applegarth of the Carpenters, the average trade-unionist cared nothing for parliamentary action. Even when free to act, their very successes made the trade-unions conservative. Men, like Mr. Broadhurst, actually opposed eight-hour legislation; a motion in support of it was defeated by a large majority at a trade-union congress as late as 1889.

The collectivist policy, however, became so popular that, weary of the vast promises and slight fulfilment of both the Liberal and Conservative parties, there was organized (Jan., 1893), mainly under the lead of Keir Hardie, elected M. P., an Independent Labor Party, its object being, as stated, "the collective ownership and control of the means of production, distribution, and exchange." Robert Blatchford's "Merrie England," emphasizing the principles of the party, about this time is estimated to have reached 2,000,000 readers.

Municipalism of various kinds was long, however, the main practical form of English socialism. The formation of the county councils, and particularly of the London County Council, to bring together under one control the numberless boards and vestries that had power in various ways in London, was another step toward socialism.

Later, attention was directed to some extent from social problems by the Boer War and discussions arising from it, and under its influence the Conservatives gained a new lapse of life. Gradually, however, the majority of the trade-unions, while not committing themselves to avowed socialism, came to favor political action directly in their own interests, on largely socialistic lines and independent of any political party.

Labor Politics

A Labor Representation Committee was organized composed mainly of representatives of such unions, and of a few other organizations, like the Fabian Society, willing to cooperate on those lines, to manage the campaigns of candidates indorsed by the committee, and create a fund for the payment of the elected members. (See LABOR REPRESENTATION COMMITTEE.) This movement had growing success, till in the general election on Jan., 1906, the Labor forces astonished themselves and all England by electing to Parliament twenty-nine candidates indorsed by the Labor Representation Committee, which with eleven "miners' members" and fourteen Liberals, but also Labor members, made fifty-four Labor members (twenty-nine independent of other parties). The committee therefore adopted, 1906, the name of the Labor Party (*q. v.*), with Keir Hardie as its head. The independent, aggressive, and yet, on the whole, constructive and practical position of the party's representatives in Parliament has been the social reform political interest of the year, while by-elections have added three to their number (including one elected as a Socialist), making some eighty members all largely socialistic in their policies.

Meanwhile other phases of social reform have recently rapidly advanced. Distributive cooperation has grown steadily and productive cooperation has been begun in earnest. (See COOPERA-

TION.) Cooperative housebuilding has begun, but especially have municipal and county councils taken up the housing question, in many cases undertaking large housing schemes. (See HOUSING QUESTION.) A successful Garden City movement has been developed (see GARDEN CITIES), while prominent employers have developed large and beautiful model villages for their employees. (See BOURNEVILLE; PORT SUNLIGHT; MODEL VILLAGES.) The question of employing the unemployed has been largely agitated and successful attempts inaugurated. (See LABOR COLONIES; UNEMPLOYMENT.)

Present Movements

Considerable attention has been called to the woman-suffrage question by women who were willing to storm the House of Parliament in demanding a hearing and allow themselves to be imprisoned for creating disturbance. (See WOMAN'S MOVEMENTS.) Much thought has been attracted to the taxation of land values by the introduction in Parliament of a Scotch bill calling for a distinction in making up rates on values of land and values of improvements. Many members, including the Premier, are said to favor the distinction. (See LAND.) The school question has been a burning theme, tho a compromise bill calling in the main for separation of all public schools from Church control was thrown out of the Lords after it had passed the Lower House. (See SCHOOL QUESTION, articles on both sides.) (For the home rule question, which has so largely affected English politics, see HOME RULE; IRELAND.) Great Britain may be said to-day to be leading the world (outside of New Zealand and Australia) in the actual taking up of detailed social questions and pressing for their solution from an advanced point of view, tho Germany and Switzerland are probably actually doing more on slightly more paternal lines. (See special articles for references and all details.)

GREDESKUL, NICHOLAS ANDREYEVICH:

Russian jurist, editor, and politician; born in 1864. He was graduated from the University of Kharkof, and later became a professor there, and dean of the law department. Gredeskul, who was second vice-president of the first Duma, was arrested just before election by order of Minister Durnovo, and was exiled to Archangel; but on being elected he was released. He is a Constitutional Democrat, and edits a newspaper called *Mir*.

GREEK SOCIAL POLITY: This was, in a word, the exaltation of the State, ordinarily a democratic city, based upon slave labor, over all departments of life. (See ATHENS; ARISTOTLE; PLATO.) We give here the synopsis of the Greek economic and social idea, as given in Professor Ingram's "History of Political Economy":

1. The individual is conceived as subordinated to the State, through which alone his nature can be developed and completed, and to the maintenance and service of which all his efforts must be directed. The great aim of all political thought is the formation of good citizens; every social question is studied primarily from the ethical and educational point of view. The citizen is not regarded as a producer, but only as a possessor of material wealth; and this wealth is not esteemed for its own sake or for the enjoyments it procures, but for the higher moral and public aims to which it may be made subservient.
2. The State, therefore, claims and exercises a controlling and regulating authority over every sphere of social life, including the economic, in order to bring individual action into harmony with the good of the whole.
3. With these fundamental notions is combined a tendency

to attribute to institutions and to legislation an unlimited efficacy, as if society had no spontaneous tendencies, but would obey any external impulse, if impressed upon it with sufficient force and continuity.

GREELEY, HORACE: American editor and social reformer; born at Amherst, N. H., 1811. Before he was ten years old his father became bankrupt. The family then moved to Vermont, where they made a scanty living as day laborers. When fourteen years of age Greeley was apprenticed in the office of the *Northern Spectator*, East Poughkeepsie, Vt. His wages were but \$40 a year; but by living on almost nothing he was able to send money home. He remained here six years, when the paper was suspended. For a time he worked with his father on a rough farm in Pennsylvania, and then began to tramp the country in search of employment. In 1831 he entered New York with \$10 in his pocket, and two years later formed a partnership with a fellow workman, Francis V. Story. Combining their capital, which amounted to \$150, they commenced by printing the *Morning Post*, which failed in three weeks. But Greeley went on writing as well as printing. He was invited by James Gordon Bennett to go into a partnership with him in the *Herald*, but he declined, and issued instead the *New Yorker*, a literary journal which lived seven years. Later he published the *Log Cabin*, a weekly campaign paper, which was a great success. On April 10, 1841, Greeley commenced the *New York Tribune*, his life-work.

Greeley was then entirely without money. From a personal friend, Mr. James Coggeshall, he borrowed \$1,000, on which capital and the editor's reputation the *Tribune* was founded. It began with 600 subscribers. Mr. Greeley opened its columns to well-nigh every reform. He made it the leading abolition newspaper. He advocated in it dress reform, vegetarianism, and FOURIERISM.

From 1850 until the end of the Civil War the *Tribune* did much to create and awaken the anti-slavery sentiment of the North. Greeley urged in his paper the vigorous prosecution of the war, but at its close immediately advocated universal amnesty and suffrage. From 1848 to 1849 he was a Whig representative in Congress.

In 1867 Greeley was appointed delegate to the convention for the revision of the Constitution. He antagonized General Grant's administration, and was one of the chief promoters of the Liberal Republican Party, which held its national convention at Cincinnati in 1872, and nominated him for president. His lifelong opponents, the Democrats, nominated him also at their national convention—a move which greatly lessened his chances of success by repelling many of his Republican supporters. During the canvass feeling ran high, and he took the field in person and made one of the most brilliant, able, and sustained series of campaign speeches on record. In the election he received 2,834,079 votes as against 3,597,070 for Grant. Greeley carried Georgia, Kentucky, Maryland, Missouri, Tennessee, and Texas. He at once resumed the editorship of the *Tribune*, but it was soon evident that he had overtaxed his strength in the campaign. No sooner was it ended than he was called to the bedside of his dying wife, from which he went only to be himself prostrated by a nervous disorder of the brain. His illness was short, and on Nov. 29, 1872, he died. His published volumes are as follows: "Hints Toward Reforms" (1850);

"Glances at Europe" (1851); "History of the Struggle for Slavery Extension" (1856); "Overland Journey to San Francisco" (1860); "The American Conflict" (2 vols., 1864-66); "Recollections of a Busy Life" (1868); "Essays Designed to Elucidate the Science of Political Economy" (1870); and "What I Know of Farming" (1871). His life was written by James Parton in 1855, and a new edition appeared in 1868.

GREENBACK PARTY, THE: A party which originated in the United States in 1873-74 as a result of the opposition felt by many to the asserted manipulation of the currency in favor of the banking and bondholding class. (See CURRENCY.) It was claimed that the bankers of the country had conspired (1) to make the issue of the war greenbacks a failure by inducing Congress to prevent their being legal tenders for customs and for payment of the national debt, and so depreciating their value; (2) to buy up these greenbacks at their depreciated value, and with them purchase bonds, paying for the bonds with greenbacks at their face value; (3) to induce Congress to vote that these bonds bought with greenbacks at thirty cents on the dollar should be redeemed by Congress under the pretense of national faith and of "an honest dollar" in gold (interest as well as capital), while the soldiers and sailors of the war who had risked their lives and got no "interest" had been paid in greenbacks. Intense excitement was aroused, which the period of contraction of the currency greatly increased. As early as 1868 the demand called "the Ohio idea" was broached, claiming that all bonds which did not distinctly call for payment in coin should be redeemed in greenbacks. This "idea" seemed to have dominated the Democratic convention of 1868, but was distinctly disavowed by Mr. Tilden and other leading Democrats. Many local and state conventions in the West, however—chiefly Democratic—indorsed the idea. Its advocates still hoped to bring the entire party to their way of thinking.

Finally the financial crisis of 1873 caused the masses of the people to seek legislative relief for the evils from which they were suffering, and produced a certain disintegration of the established political parties.

Demands

The pressing questions of the time appeared to require and justify new political organizations. A Greenback convention was held at Indianapolis in 1874, and demanded: (1) The withdrawal of the national bank-note currency; (2) that the only currency should be of paper, and that such currency should be made exchangeable for bonds bearing interest at 3.65 per cent; and (3) that coin might be used for the payment of the interest and principal of such bonds, and such only, as expressly called for coin payments. In 1876 a national Greenback convention was held at Indianapolis, which nominated Peter Cooper, of New York, and Samuel F. Cary, of Ohio, for president and vice-president. In the election which followed they received 81,737 popular votes.

To these attempts to found a new party, based on financial issues, a turn in another direction was given by the labor troubles which had culminated in the great railroad strikes of 1877. In 1878 a "National or Greenback-Labor Convention" was held at Toledo, O., as the result of a coalition between the labor reformers and the advocates of a greenback currency. In the following election

the Greenback-Labor tickets polled over 1,000,000 votes, and fourteen representatives of the party were sent to Congress. But the party was made up of different elements; and altho the distress which gave it strength was real, none of the party leaders seems to have had definite ideas as to what was to effect a cure. In 1880 the Greenback-Labor convention, at Chicago, nominated James B. Weaver, of Iowa, and B. J. Chambers, of Texas. In that year the popular Greenback-Labor vote was 300,867, and eight of their representatives were elected to Congress. The ticket in 1884 was headed by General B. F. Butler, who was also the Anti-Monopoly candidate, and received 175,380 votes. In that year the Greenback ticket in Iowa, Michigan, and Nebraska was fused with that of the Democrats, and in Missouri and West Virginia with the Republican ticket.

The Greenback Party proper always had its strongest support in the Western States. In Maine, New York, Vermont, and Massachusetts the Greenback element was made up of labor reformers, and its tickets were as a rule supported principally by laboring men. But on several occasions the Greenbackers received encouragement and support from either one or the other of the two great parties of the country, who hoped to create a diversion in their own favor by running a third ticket, so made up as to draw votes from the opposing party.

The following is the platform of the Greenback-Labor Party, adopted at the National Convention, held in Chicago, June 9 and 10, 1880:

Civil government should guarantee the divine right of every laborer to the results of his toil, thus enabling the producers of wealth to provide themselves with the means for physical comfort and the facilities for mental, social, and moral culture; and we condemn as unworthy of our civilization the barbarism which imposes upon the wealth producers a state of perpetual drudgery as the price of bare animal existence.

Notwithstanding the enormous increase of productive power, the universal introduction of labor-saving machinery, and the discovery of new agents for the increase of wealth, the task of the laborer is scarcely lightened, the hours of toil are but little shortened, and few producers are lifted from poverty into comfort and pecuniary independence.

The associated monopolies, the international syndicates, and other income classes demand dear money and cheap labor, a "strong government," and hence a weak people.

Corporate control of the volume of money has been the means of dividing society into hostile classes; of the unjust distribution of the products of labor, and of building up monopolies of associated capital, endowed with power to confiscate private property. It has kept money scarce, and scarcity of money enforces debt trade, and public and corporate loans—debt engenders usury, and usury ends in the bankruptcy of the borrower.

Other results are deranged markets, uncertainty of manufacturing enterprise and agriculture, precarious and intermittent employment for the laborer, industrial war, increasing pauperism and crime, and the consequent intimidation and disfranchisement of the producer, and a rapid declension into corporate feudalism.

Therefore we declare:

(1) That the right to make and issue money is a sovereign power to be maintained by the people for the common benefit. The delegation of this right to corporations is a surrender of the central attribute of sovereignty, void of constitutional sanction, conferring upon a subordinate irresponsible power, and absolute dominion over industry and commerce. All money, whether metallic or paper, should be issued and its volume controlled by the government, and not by or through banking corporations, and when so issued should be a full legal tender for all debts, public and private.

(2) That the bonds of the United States should not be refunded, but paid as rapidly as it is practicable, according to contract. To enable the government to meet these obligations, legal tender currency should be substituted for the notes of the national banks, the national banking system abolished, and the unlimited coinage of silver, as well as gold, established by law.

(3) That labor should be so protected by national and state authority as to equalize its burdens and insure a just distribution of its results; the eight-hour law of Congress should be enforced; the sanitary condition of industrial establishments

placed under rigid control; the competition of contract convict labor abolished; a bureau of labor statistics established; factories, mines, and workshops inspected; the employment of children under fourteen years of age forbidden, and wages paid in cash.

(4) Slavery being simply cheap labor, and cheap labor being simply slavery, the importation and presence of Chinese serfs necessarily tends to brutalize and degrade American labor; therefore immediate steps should be taken to abrogate the Burlingame treaty.

(5) Railroad land grants forfeited by reason of non-fulfillment of contract should be immediately reclaimed by the government; and henceforth the public domain reserved exclusively as homes for actual settlers.

(6) It is the duty of Congress to regulate interstate commerce. All lines of communication and transportation should be brought under such legislative control as shall secure moderate, fair, and uniform rates for passenger and freight traffic.

(7) We denounce, as destructive to prosperity and dangerous to liberty, the action of the old parties in fostering and sustaining gigantic land, railroad, and money corporations and monopolies, invested with and exercising powers belonging to the government, and yet not responsible to it for the manner of their use.

(8) That the Constitution, in giving Congress the power to borrow money, to declare war, to raise and support armies, to provide and maintain a navy, never intended that the men who loaned their money for an interest consideration should be preferred to the soldier and sailor who periled their lives and shed their blood on land and sea in defense of their country, and we condemn the cruel class legislation of the Republican Party, which, while professing great gratitude to the soldier, has most unjustly discriminated against him, and in favor of the bondholder.

(9) All property should bear its just proportion of taxation, and we demand a graduated income tax.

(10) We denounce as most dangerous the efforts everywhere manifest to restrict the right of suffrage.

(11) We are opposed to an increase of the standing army in time of peace, and the insidious scheme to establish an enormous military power under the guise of militia laws.

(12) We demand absolute democratic rules for the government of Congress, placing all representatives of the people upon an equal footing, and taking away from committees a veto power greater than that of the president.

(13) We demand a government of the people, by the people, and for the people, instead of a government of the bondholder, by the bondholder, and for the bondholder; and we denounce every attempt to stir up sectional strife as an effort to conceal monstrous crimes against the people.

(14) In the furtherance of these ends we ask the cooperation of all fair-minded people. We have no quarrel with individuals, we wage no war upon classes, but only against vicious institutions. We are not content to endure further discipline from our present actual rulers, who, having dominion over money, over transportation, over land and labor, over the machinery of government, and largely over the press, wield unwarrantable power over our institutions, and over life and property.

The literature of the movement is large, but much of it was in only transient form. Among the best books is B. S. Heath's "Labor and Finance Revolution." The papers of Henry C. Baird and "The Currency Question," a pamphlet by G. M. Steele, contain more moderate statements of the views of the Greenback Party. (For a discussion of the principles voiced by the Chicago convention of 1880, see CURRENCY; MONEY.)

GREULICH, HERMANN: Swiss statistician; Swiss Workmen's Secretary. The Swiss Confederation has no department of labor, but the *Arbeitersekretariat* was established in 1887. It has a semi-official standing, the salaries and expenses being paid by the government, while the secretary is chosen by the labor organizations. The office was created in April, 1887, by the election of Mr. Greulich, a statistician of Zurich; 142 labor organizations, representing about 100,000 working men, were interested in the election through a central committee; it was for three years, but has been renewed since. The new secretary placed himself in touch with the cantonal and foreign governments' labor and social departments. In 1888 he published an exhaustive study of wages in Switzerland; 1890 and 1893 statistics on accidents. Author: "In-

stitutions of the Paris Municipal Council for the Protection of the Working Classes" (1889). *Address: Arbeitersekretariat, Bern, Switzerland.*

GREY, SIR GEORGE: Third governor of New Zealand; has been called "the greatest figure in the first half-century of New Zealand's colonial history"; born at Lisburn, Ireland, 1812; educated at Sandhurst for the army; entered the service and became captain in 1835. In 1839 he went on an exploring expedition in Australia, and two years later was appointed Governor of South Australia. In 1845 he was transferred to the governorship of New Zealand, and successfully closed the first Maori War. He largely drafted the present constitution of the colony, which had been on the brink of ruin when he became its executive. In 1854 he left the colony on the road to prosperity, and was transferred to the governorship of Cape Colony; but in 1861 he was transferred back to New Zealand to conduct the second Maori War. He retired in 1868, but in 1875 came into public life as a leading Liberal, and was premier from 1877 to 1879. After resigning this office he sat in Parliament almost continuously till he retired in 1894 on account of old age. He gained great support all over Australia for his liberal views, especially for his advocacy of the "one man, one vote" idea, woman's suffrage, and national ownership of the soil. A natural leader with extraordinary abilities, he was at times hated and criticized by some, but honored, loved, and followed by the many. He died in 1898.

GRONLUND, LAWRENCE: American Socialist, lawyer, and writer; born in Denmark, 1848; took part in the Dano-German War of 1864; studied law at the University of Copenhagen; emigrated to the United States in 1867, and for a time taught German in a public school in Milwaukee. In 1869 he was admitted to the bar and began practising law in Chicago. He became interested in socialism by reading Pascal's "Pensées." In 1880 he published a dialogue on "The Coming Revolution," and in 1884 his "Cooperative Commonwealth," the first full statement of modern socialism published in this country, and which had a wide sale and influence. Mr. Gronlund then devoted himself to the propaganda of socialism, and wrote and lectured wherever he could get a hearing—in Chicago, New York, Boston, and on the Pacific coast. He held for a while an office in the U. S. Labor Department. In 1887 he published "Danton," a study of the French Revolution, and in 1890 "Our Destiny," a work religious as well as socialist, which had a large sale, especially in England, where 1,000 copies were sold in the first month. The *Revue d'Economie Politique* called it "the most elevated and attractive conception of socialism yet published." Mr. Gronlund died in 1899.

GROTIUS, HUGO, or DE GROOT: Dutch jurist and writer; born at Delft, 1583; son of the burgo-master of the town; entered the University of Leyden in 1594, graduating in 1598. Traveling in France, he returned to practise as a lawyer, and in 1607 was fiscal general, and in 1610 council-pensionary at Rotterdam. For supporting the Remonstrants he was condemned, in 1619, to imprisonment for life, but escaped by the aid of his wife, who took his place in the castle, for her bravery she was set free. He wandered

through the Netherlands and France, and for a while enjoyed a pension at the court of Louis XIII. He was allowed to return to Holland, but was soon again exiled for life. A wanderer again, he entered the service of Sweden, and from 1635 to 1645 was Swedish ambassador at Paris. Returning to Sweden, he passed through Amsterdam, and was honored there as well as in Sweden. He received a pension, but while journeying fell ill and died at Rostock in 1645. He was a profound scholar, an eminent theologian, an erudite historian, a Latin poet, an eminent jurist. His "De Jure Belli et Pacis" (1625) has been translated into all the languages of Europe, and may be called the basis of international law. (See POLITICAL SCIENCE.)

GRÜN, KARL: German Socialist; born at Lüdenscheld, 1813; educated at the gymnasium at Wetzlar; studied theology and philosophy at Bonn and Berlin. From 1839 to 1842 he taught languages in Colmar, whereafter he returned to Germany, founding the *Mannheimer Abendzeitung*. He was, however, expelled from Baden on account of alleged revolutionary tendencies, whereupon he settled in Cologne where he edited a weekly, *Der Sprecher*. He became converted to socialism, and visited Belgium and Paris. In 1845 he published "Die Sociale Bewegung in Frankreich und Belgien, Briefe und Studien." Returning to Germany in 1848, Grün was elected to the second chamber of the Prussian Diet, where he joined the extreme Left. On the dissolution of this Diet he was accused of having taken an "intellectual" part in the "Pfalz Uprising"; but after eight months' incarceration was acquitted. He then spent some years abroad, returning on the death of Frederick William IV., and settling in Frankfort-on-the-Main, where he earned a living as an instructor in a commercial school. In 1870 he settled in Vienna, where he died in 1887.

GUESDE, JULES: French Socialist leader; born in Paris, 1845. Entering political journalism in Paris, Toulouse, and Montpellier, at the latter place he published the *Droits de l'homme*, and was imprisoned six months for a revolutionary article against the empire. At the time of the Commune he attempted to stir up a revolution in Montpellier; was condemned to five years' imprisonment; fled to Geneva and joined the Internationalists. Driven to Italy, he returned to Paris in 1876 and edited the *Citoyen*, the *Cri du Peuple*, and then founded the *Egalité*, the first paper of modern Marxist socialism in France. In 1879, with Marx, Engels, and La Fargue, he drafted the program of the Marxist *Parti ouvrier français*, of which he became the foremost leader. (See FRANCE.) Imprisoned for six months in 1878 and again in 1883 for his Socialist activities, in 1893 he was elected deputy from Roubaix. Since this date to his reelection in 1906, he followed the varying fortunes of the *Parti ouvrier français*, and is now one of the active members of the United French Socialist Party. Among his numerous tho brief writings are: "Collectivisme et Revolution"; "Socialisme et services publiques"; "Le Collectivisme au Collège de France."

GUILDS. See GILDS.

GUNTON, GEORGE: American economist and editor; born in Cambridgeshire, England, 1847;

emigrated to the United States in 1874, and for some time worked in factories in Massachusetts. Interested in social studies, and especially in the eight-hour philosophy, he became an editorial writer on economic themes. His "Wealth and Progress," which appeared in 1887, is the fullest statement of the eight-hour philosophy, tho not indorsed by most of the eight-hour trade-unionists on account of its author's opposition to many other progressive views held by trade-unions, and by some of them on account of his advocacy of protection. In 1890 Mr. Gunton became president of the Institute of Social Economics, and editor of the *Social Economist*, the name of

which was changed in 1896 to *Gunton's Magazine*. Address: Colorado Buildings, Washington, D. C.

GUTHRIE, ROBERT STORRIE: Australian statesman; born in Ayr County, Scotland, 1857; spent ten years at sea; went to Australia in 1878 and engaged in the coasting trade; became secretary of the Federated Seamen's Union of Australia in 1887, and is also secretary of the Federal Council of Australian Labor Unions. He was elected senator for South Australia in the Australian Federal Parliament in 1903. Address: Knighton Villa, Peterhead, South Australia.

H

HADLEY, ARTHUR TWINING: President of Yale University; born at New Haven, Conn., 1856. Graduated from Yale, 1876. Studied in Berlin. Tutor and lecturer on railroad transportation at Yale 1879-86. Commissioner of Labor for Connecticut 1885-87. Professor of political science, Yale, 1886-99. Since then president. Author of "Railroad Transportation" (1885); "Labor Reports" (1885-86); "Economics" (1896), a work largely used as a text-book; "The Education of the American Citizen" (1901); "Freedom and Responsibility" (1903); "Baccalaureate Addresses" (1907). Address: 93 Whitney Avenue, New Haven, Conn.

HAGGARD, HENRY RIDER: Author; sociologist; born Bradenham, Norfolk, 1856. Educated at Ipswich and privately. Secretary to Governor of Natal and then to a commissioner in Transvaal, 1875-79. Formally hoisted the British flag at Pretoria, 1877. Barrister of Lincoln's Inn, 1884. His first book, "Cetywayo and His White Neighbors," appeared 1882; "Dawn" (1884); "King Solomon's Mines" (1886). These and other novels made him famous, and he wrote prolifically. From 1896-98 he journeyed through England, studying rural conditions, and became deeply interested in social problems with which he deals in "Rural England," his most important work. He was made commissioner to report on the Salvation Army colonies in the United States, and made a report (1905) strongly advocating similar schemes for the colonization of England's unemployed by private associations, but with government control and aid, with a scheme for national land settlement. He is an active magistrate and member of the Royal Commission on Coast Erosion, 1906. Address: Ditchingham House, Norfolk, England.

HALE, EDWARD EVERETT: Unitarian clergyman and author; born in Boston, 1822. Graduated at Harvard College in 1839, and licensed to preach in 1842. Pastor in Worcester (1846-1856), then pastor of the South Congregational (Unitarian) Church, in Boston, where he still remains. He is even better known as a leader and often the starter of a marvelous number of philanthropic movements. His *Ten Times One is Ten* led to the establishment of clubs devoted to doing good scattered throughout the world, with a membership of over 50,000. They are called "Lend-a-Hand" clubs and have for their motto, "Look up and not down; look forward and not back;

look out and not in; and lend a hand." He has also taken great interest in the Chautauqua and other literary, educational, and reform movements. When the Nationalist and Christian Socialist movements were commenced, Dr. Hale interested himself in them, and has sometimes even declared himself a Socialist. In 1869 he founded, in connection with the American Unitarian Association, the magazine *Old and New*, which in 1875 was merged into *Scribner's Monthly*. In 1886 he started *Lend a Hand*. His short stories are among his best works, notably "My Double and How He Undid Me" (1859), "The Man Without a Country" (1863), "In His Name," and "How They Lived in Hampton"—a socialistic story. Address: 39 Highland Street, Roxbury, Mass.

HALL, BOLTON: Lawyer; reformer; born in Ireland, 1859; son of Dr. John Hall. Educated in Dublin till 1867. Graduated at Princeton University, 1875. Has lectured and written many brochures on fundamental reforms, advocating the single tax, and large personal liberty. He has been especially active in promoting the cultivation of vacant lots by the unemployed. (See VACANT LOTS.) Author of "Even as You and I" (1889); "Things as They Are" (1900); "The Game of Life" (1903); "Three Acres and Liberty" (1907). Address: 33 East Sixty-first Street, New York.

HALL, FRED: Labor member of Parliament for Nomanton, West Riding, Yorkshire. Born 1855 in Staffordshire. He entered a Rotherham colliery, became secretary of the Yorkshire Miners' Association in 1878, and later treasurer and agent. Has been Grand Master of the British United Order of Odd Fellows. He was returned to Parliament in Nov., 1905, without opposition, chiefly by the miners, assisted by the Liberals. Address: Rowmarsh Hill, Parkgate, near Rotherham, Yorkshire, England.

HAMPDEN, JOHN: English statesman and patriot; born London, 1594. Entered Oxford, 1610, and the Inner Temple, London, 1621. In 1621 he first sat in the House of Commons as member of the antiroyalist party. In 1627 he was imprisoned for nearly a year for refusing his proportion of a general loan, which the king concluded to force. He remained in Parliament till the dissolution in 1628, becoming one of its leading members. In 1634 he refused to pay a tax, unjustly levied, and was prosecuted for non-pay-

ment and was condemned. In the Short Parliament of 1640 he took an active part against the crown. In the Long Parliament, 1647, he was one of the first members the king attempted to seize. During the Civil War he was colonel of a regiment he himself raised and was wounded at Chalgrove Field. He died 1643.

HAMILTON, ALEXANDER: American statesman; born on the island of Nevis, West Indies, in 1757, the son of a Scotch merchant. Entering a counting-house at the age of twelve, his abilities induced his friends to secure for him a college education, and he was graduated at Columbia College, New York. At the age of eighteen he wrote a series of papers on the relation of the colonies to England, which were at first taken for the production of the statesman Jay. On the outbreak of the war he became a captain of artillery, but soon gained the confidence of Washington and became his aide-de-camp and confidant in 1777. In 1780 he married a daughter of General Schuyler, and became one of New York's leading lawyers.

He was a member of the Continental Congress from 1782-83, and of the Convention of 1787. His perspicacity and power of thought were remarkable. One of the most abused as well as one of the most lauded of men, he played a leading part in the early history of this country.

In conjunction with Madison, he had the most important share in drafting the Constitution. He was a strong supporter of the federal policy of developing a strong national government, and, along with Jay and Madison, defended the Constitution against all attacks by a series of letters in the *Daily Advertiser* of New York, afterward collected and published under the title of "The Federalist" (q. v.). On the establishment of the new government in 1789, with Washington as president, Hamilton was appointed Secretary of the Treasury. The disorder of the public credit and the deficiency of official accounts of the State treasury rendered this office one of peculiar difficulty. In order to reestablish public credit, he carried, in spite of much opposition, a measure for the funding of the domestic debt, founded a national bank, and rearranged the system of duties. In 1795 he resigned his office and resumed the practise of law in New York. When the war with France broke out in 1798, he was, according to the wish of Washington, made Major-General of the United States Army; and, on the death of Washington, he succeeded to the chief command. When peace was restored, he returned to his civil duties, but became involved in a political quarrel with Aaron Burr. This difference unhappily culminated in a duel, in which Hamilton received a wound of which he died the following day (July 12, 1804). (See **FEDERAL PARTY; CONSTITUTION.**)

HANFORD, BEN: Socialist; born Cleveland, Ohio, 1859; an active member of the International Typographical Union for twenty-eight years. In 1898 the Socialist Labor Party made him their candidate for governor of New York; in 1900 was candidate of Social Democratic Party for the same office; in 1901 candidate of Social Democratic Party for mayor of New York City; in 1902 its candidate for the governorship again. In 1904 Hanford was its candidate for the vice-presidency. He is a political and revolutionary Socialist, and author of numerous political and industrial pamphlets and leaflets, which have had

a circulation of many million copies. Address: 2335 Bedford Avenue, Brooklyn, New York.

HARDIE, JAMES KEIR: Labor leader; member of Parliament; born 1856, near Holytown, Lanarkshire, Scotland; had no schooling advantages. At eight years of age he was a doorkeeper in a mine, and worked in the mines until twenty-three, when a difficulty between masters and men having arisen he was chosen leader of the miners. Dismissed and blacklisted, he was elected secretary of a miners' union. In 1882 he joined the editorial staff of *The Cumnock News*. In 1888 he stood as a Socialist for Parliament at Mid-Lanark, but was defeated. He was successful, however, in 1892, in South West Ham, gaining a majority of 1,232. Defeated in the same constituency in 1895, in the 1900 election he contested Preston and Merthyr Tydvil, losing the former and winning the latter by 1,700 votes over a Liberal candidate. In 1906 he was elected the second time for Merthyr Tydvil with 3,000 majority. He founded the **INDEPENDENT LABOR PARTY**, established *The Labor Leader* in 1887, and edited the paper until 1904, when it became the official organ of the party, and was definitely taken over as such. In Parliament he has championed the cause of the unemployed, strenuously opposed the South African War, and is a strong advocate of equal rights being granted to women as to men. He is a member of the Fabian Society. He was in February, 1906, elected parliamentary leader of the Labor Party. He is often spoken of as the "Member for the Unemployed." He has written much on social topics and published pamphlets on almost every subject bearing upon working class reform. Address: 14 Nevill's Court, E. C., London, England. Home Address: Lochnorris, Old Cumnock, Scotland.

HARMONISTS, THE: The name of a religious celibate German community, established at Economy, Pa. The sect was founded in Würtemberg by George Rapp with his son Frederick about 1787, and its adherents are sometimes called Rappists. They believe that the condition of celibacy is most pleasing to God; that the coming of Christ and the renovation of the world are near at hand; that Christ taught a community of goods; that ultimately all mankind will find salvation; but that only those who are celibates, and otherwise conform to what they believe to be the commandments of Jesus, will be at once received into the company of Christ and His companions. The early members were so harassed by petty persecutions that in 1803 they emigrated to Pennsylvania and Maryland. In 1805 they were prosperously established at Harmony, Butler County, Pa., where they remained ten years, but lack of water communication induced them to migrate to New Harmony, Ind., remaining there until 1824, when they sold their land to Robert Owen, the Socialist, and returned to Pennsylvania, establishing themselves at Economy, near Pittsburgh. With their accustomed energy they set to work establishing mills, a tannery, a distillery, and other plants, and adding a large hotel to their various industries. They produced silk, wool, and cotton goods, and made a remarkably good wine. Everything was turned into the productive channel, even the vines over the doors bearing fruit. They also "struck oil" on their property, which added largely to their wealth, and they purchased 2,000 acres more.

All this prosperity, which lasted many years, was due to the administrative genius of Father Rapp, his equally able son, and to Father Henri, long the head of the community. In numbers, however, they declined, due to their celibacy and to the fact that they sought few accessions. As Economy, too, was so near a large manufacturing center many of the members forsook their earlier ideals and took their place in the competitive strife of the city, and the last years of the society's existence were marked by desertions, deaths, and lawsuits. In April, 1903, all the holdings of the Harmony Society, including the town of Economy, were bought by a Pittsburg syndicate. Their wealth at one time was variously estimated from \$5,000,000 to \$25,000,000.

HARRINGTON, JAMES: Born at Upton, 1611; educated at Oxford University. In 1646 he was a personal attendant to Charles I. when he was imprisoned, and attended him at his execution. In 1656 he published the work he is best known by, "Oceana"—a political allegory, somewhat in imitation of Plato—in which he depicted an ideal republic named Oceana. He was arrested in 1661 on a charge of treason, but was confined without a trial until he finally became insane, and died in 1677. The probable reason of his imprisonment was his avowed republican opinions.

HARRIS, THOMAS LAKE: Born at Fenny Stratford, England, 1823. In 1827 his father came to America and settled at Utica, N. Y. Soon compelled to earn his own living, at seventeen he began to write for newspapers. In 1844 he became a Universalist preacher at Minden, N. Y., and from 1845-47 in New York City. In 1848, having adopted Swedenborgian views, he organized an Independent Christian Society in New York. He afterward lectured in many parts of the union, endeavoring to turn the public interest in spiritualism to what he considered a higher plane of religious thought and life. In 1855 he established the *Herald of Light* to advance his views, and in 1858 visited England and Scotland, where he gained converts. Returning in 1861, he settled in Amenia, N. Y., where friends gathered around him and formed the "Brotherhood of the New Life." The Brotherhood was afterward removed to Brocton, N. Y., where Lady Oliphant and several Japanese of distinction joined the society, and remained many years. The Brotherhood was a school and the friends came as students desirous of a social life higher and more unselfish than the conventional life of civilization. The property was not held in common, but Mr. Harris seemed to hold all power in his hands, creating great hostility, deserved or undeserved. After 1876, however, it was transferred to Santa Rosa, Cal.; it gradually lost almost all its aspects as a community and became simply a prosperous business corporation, carrying on extensive agricultural undertakings, mainly in California wines. Harris died in 1905.

In reply to an inquirer, Harris made the following statement in brief:

The life, system, and action of the society which I represent are so far removed from the lines of the usual thought, that I fear I shall hardly be able to answer your friendly inquiries with the fulness you desire. Personally I am not a communist. . . . I find myself ensnared by a large circle of men and women who have been driven to me by a potent attraction

but without any conscious endeavor of my own. My life is devoted to their service, and they constitute the society known as the "Brotherhood of the New Life."

This family passed, years ago, through the communistic phase, in which, however, I did not take part, the esteeming it a phase in evolution and serving it financially. Without dissension or disunion, its members then passed into a phase of modified socialism, each series constituting a family partnership; and they found that this mode of combined action developed a large force of individual character, as well as a more strict business habit and aptitude, but the spirit was not fully satisfied.

Views

Meanwhile I organized my own affairs amid my friends, and employed all who did not fit or find place elsewhere, treating them as sons, but insisting on paying weekly wages. After a time they found it incompatible with their forming affections to receive money-pay. I then entertained them as guests, brethren, and children in their father's house; and this satisfied them. There is no espionage; honor rules; love is supreme. Gradually the family partnerships have ceased, without a struggle, and all have entered into this order.

We think that generation must cease till the sons and daughters of God are prepared for the higher generation, by evolution into structural, bisexual completeness, above the plane of sin, of disease, or of natural mortality.

Believers in the Divine Immanence, we hold by the "True Light," that lighteth every man who cometh into the world; but we further conclude that the Creative Logos, "God manifested in the flesh," is not male merely, nor female merely, but the two in one. The doctrine of the Divine-Human Two-in-One, in whose individual and social likeness, in whose spiritual and physical likeness, we seek to be reborn, is the pivot of our faith and the directive force of our life.

His principal works are: "Lyric of the Golden Age" (1855); "Arcana of Christianity" (Genesis), (1858); "The Great Republic" (1867); "Wisdom of the Adepts" (1884); "The New Republic" (1894); "The Marriage of Heaven and Earth" (1903). See also Edwin Markham's "Remarkable Pages from Thomas Lake Harris" (1908).

EDWIN MARKHAM.

HARRISON, FREDERIC: Leading English Positivist; born in London, 1831; educated at King's College, London, and at Oxford. He was admitted to the bar in 1858. Member of the Royal Commission of Trade-Unions, 1867-69, and for Digesting the Laws, 1869-70. In 1877 he was appointed Professor of Jurisprudence and International Law by the Council of Legal Education, and remained till 1889. He was alderman and on the London County Council 1889-92. He has deeply interested himself in the English Labor movement, in 1861 writing important letters to the press defending trade-unionism; later getting trade-unions legalized as friendly societies; writing for the *Beehive* from 1861-77, the principal Labor paper of London, etc. He is the chief exponent of the Positivist school, a critic of authority, and a master of English prose. Among his works are: "The Meaning of History" (1862); "Social Statics" (1875); "Order and Progress" (1875); "Oliver Cromwell" (1888); "American Addresses" (1901); "Memories and Thoughts" (1906). Address: Elm Hill, Hawkhurst, Kent.

HARTMANN, KONRAD: German civil engineer; born in Nuremberg, Oct. 8, 1853; studied engineering at the technical high school at Munich, later becoming an instructor at industrial and polytechnic institutions in Nuremberg and elsewhere. In 1891 he was appointed a member of the German Reichs-Versicherungsamt, of which he in 1901 became chairman. He is also professor of accident insurance at the Royal Technical high school in Berlin. His activity is directed toward the promotion of mechanical safety devices; and he is director of the perpetual exposition of such contrivances which has been established by the German government. He has

published numerous booklets and papers on safety devices, accident insurance, factory hygiene, accident statistics, etc., etc. Address: Kurfürstendamm 100, Berlin-Halensee, Germany.

HASLAM, JAMES: Labor member of Parliament for Chesterfield, Derbyshire. Born 1842, and educated in the village schools. He was a coal miner for twenty-nine years, and the general secretary of the Derbyshire Miners' Association for twenty-five years. He was a member of the Clay Lane School Board, of the Chesterfield Board of Guardians, and of the Chesterfield Borough Council; of the Parliamentary Committee of the Trade-Union Congress; a justice of the peace at Chesterfield in 1893. Haslam was elected to Parliament in 1906 chiefly by the miners' votes, assisted by the Liberals. Address: 47 Clarence Road, Chesterfield, Derbyshire, England.

HAW, GEORGE: Author; born at Darlington, Durham, England, 1871. In 1889 he went to London as a journalist, and for a time was at Toynbee Hall. He helped to found and was the first warden of the Maurice Hostel, of the Christian Social Union. Mr. Haw is on the staff of the *London Daily News*. He is author of: "No Room to Live: the Story of Overcrowded London"; "To-Day's Work: or Municipal Government the Hope of Democracy"; "Britain's Homes: a Review of the Housing Problem in Town and Country." Editor of two popular books defending Christianity against agnostic attacks; "Religious Doubts of the Democracy"; "Christianity and the Working Classes." Address: 34 Linzee Road, Hornsey, N. London, England.

HAWAII TERRITORY: A group of eight inhabited and eleven uninhabited islands annexed in 1898 to the United States by vote of the legislatures of the islands and of Congress. In 1900 the islands were organized under a territorial form of government. The Senate has fifteen members, the House thirty. The legislature meets biennially. The executive is a governor with a secretary, appointed by the President for four years. Other officials are appointed by the governor with the approval of the Hawaiian Senate, and must be citizens of Hawaii. Hawaii is represented in Congress by one delegate, elected biennially by the people.

Total area (including water) 6,449 square miles. The island of Hawaii has 4,210 square miles; Maui, 760; Oahu, 600; Kauai, 590. Population (1900), 154,001 (only 47,632 female). This is an increase of 41 per cent since 1896. Oahu has 58,504; Hawaii, 46,847; Honolulu, the capital of Oahu, has 39,305. Of the total number, 29,787 are Hawaiians (in 1896, 31,019); 7,848 are part Hawaiian; 25,767 Chinese, and 61,111 Japanese. The total white population is 28,533. In 1902-3 there were 12,050 Japanese immigrants. Almost all the natives are Christian, about half Protestant and half Roman Catholic. Education is free, but 33.1 per cent of the population over ten is illiterate. In 1903 there were 144 public schools and 13,793 enrolled pupils.

Exports to countries outside the U. S. (1905), \$59,541. Imports from the same, \$3,014,969. Merchandise to the U. S. (1905), \$36,112,055 (\$35,112,127 sugar), and from the U. S., \$11,753,180. Sugar and rice are the staple products, but coffee, hides, bananas, wool, and whale oil and bone are also exported.

There are 128 miles of railway; nearly every house in Honolulu has its telephone.

Of those engaged in gainful occupations, 62 per cent are in agriculture, 18 per cent in domestic and personal service, 9 per cent in manufacturing, 7 per cent in trade and transportation. Fifty-two per cent are Japanese, 21 per cent Chinese, 12 per cent Caucasian, 11 per cent Hawaiian. In 1902 the wages of mechanics were \$3.80 per day; of unskilled males, seventy-one cents; of unskilled females, forty-five cents.

REFERENCE: *Third Report of the Commissioners of Labor on Hawaii*. Bulletin of the (U. S.) Bureau of Labor, No. 66, September, 1906.

HAYES, JOHN W.: the present General Master Workman of the Knights of Labor; born in Philadelphia, 1854. He never attended school. As a boy Hayes worked as brakeman on the Pennsylvania Railroad. In 1878 he lost his right arm, but took to telegraphy, at which he worked until 1883. He entered the Knights of Labor on the General Executive Board 1884-88; was secretary-treasurer 1888-92; since, General Master Workman. Address: 43 B Street, N. W., Washington, D. C.

HAYES, MAX S.: American Socialist; born at Havana, O., 1866. Educated in the public schools and became a printer. Aided in establishing *The Cleveland Citizen*, 1890, and its editor since 1897. Populist till 1896, since that time a Socialist. Has been prominent in the Socialist Party and also in trade-unions. Address: 193 Champlain Street, Cleveland, O.

HAYWOOD, WILLIAM D.: Secretary of the Western Federation of Miners; tried with Messrs. Moyers and Pettibone in Boise, Idaho, June-July, 1907, for complicity in the murder of ex-Governor Steunenberg and acquitted. (See WESTERN FEDERATION OF MINERS.)

HEADLAM, STEWART DUCKWORTH: A ritualistic Church of England clergyman and a Fabian Socialist; born at Wavertree, near Liverpool, in 1847, and educated at Eton, and Trinity College, Cambridge. He was curate of St. John's, Drury Lane, from 1870-73; St. Matthew's, Bethnal Green, 1873-78; St. Thomas's, Charterhouse, 1880-81; St. Michael's, Shoreditch, 1881-84. Mr. Headlam early interested himself in social problems as a priest of the Church of England, and his parochial duties bringing him in contact with girls and actors on the stage, he defended them from what he believed unwarranted condemnation, and came to believe in and study stage dancing as an art. A lecture on this subject gave serious offense to the late Bishop of London, and he refused him a license in his diocese, so that Mr. Headlam has worked under great difficulties. He has been the leading spirit and the real founder of the Church and Stage Guild, and also of the Guild of St. Matthew (*q. v.*), the first society still existing in England to declare for socialism. He was, till its suspension in 1895, the editor of *The Church Reformer*, the organ of the guild. Mr. Headlam is the author of several small but remarkable volumes of sermons and lectures: "Priestcraft and Progress" (1882); "Lessons from the Cross" (1887); "The Laws of Eternal Life" (1888); "Salvation through Christ"; "Christian Socialism" (1888). He has also edited part of Carlo Blesis's work on dancing, under

the title "The Theory of Theatrical Dancing." He has written essays on "The Function of the Stage," "The Ballet," etc. He thus unites the most radical views with a high Anglican Catholicism. He is most popular with the London working men, and has been elected on the London School Board for Hackney, and most actively works as a Fabian Socialist. Address: Waver-tree, St. Margaret's on Thames.

HEARST, WILLIAM RANDOLPH: American newspaper proprietor and politician; born 1863 in San Francisco; son of a United States Senator; educated in public schools and Harvard University. Editor and proprietor of *Examiner*, San Francisco, since 1886. In 1895 Mr. Hearst came to New York and bought the *New York Journal*, the name of which he changed to the *New York American*, and later founded and acquired the *New York Evening Journal*, and dailies in Boston, Chicago, and Los Angeles; also the *Cosmopolitan Magazine*, *Hearst's Home and American Farm and Motor*. His dailies reach 2,000,000 readers and employ 4,000 persons, besides space writers. They are people's papers, and are often accused of being "yellow journals"—advocating political measures popular with the masses merely to help Mr. Hearst's political ambitions, and to increase the sale of his papers. This motive is strenuously denied by practically all who know Mr. Hearst personally, who urge that his papers take this tone in order to reach the masses, but that Mr. Hearst advocates those measures from a genuine belief in democracy.

Mr. Hearst was elected as a Democrat to the Fifty-eighth and Fifty-ninth Congresses for the Eleventh New York district. In 1905 he was candidate for the mayoralty of New York, and was, in the opinion of almost all, elected, but counted out by 3,000 votes, and unable to secure a recount. In 1906 he was made candidate for the governorship of New York by the Independent League—which he had organized—and was also indorsed by the Democratic Convention, tho many Democrats opposed him. He received 691,105 votes, against 749,002 for Mr. Hughes (Republican).

HEATH, RICHARD: Author; born in Southwark, London, 1831. In 1845 was apprenticed as a wood-engraver. Roused by the French Revolution of 1848 to a serious life, he joined his ancestral church and became interested in the social problem. In 1868 he walked through the country studying the rural situation and gave the result in many articles on rural conditions. In 1884 he published "The English Via Dolorosa; or, History of the Agricultural Laborer," and another book "The English Peasant" in 1893. Mr. Heath would work for a real and complete separation of the Church from the world; for a reorganization of all states on a Social-Democratic basis with ultimate federation; for a Church whose only bond is faith in Christ and in God, and having for its ideal the voluntary communism of the New Testament. He is the author of: "The Early Life and Writings of Edgar Quinet"; "Anabaptism in 1526-1536"; "The Captive City of God," and articles in *Contemporary Review*, etc. Address: Trevereux Hill, Limsfield, Surrey, England.

HEGEL, GEORG WILHELM FRIEDRICH: Philosopher; born at Stuttgart, 1770. He studied at Tübingen with Schelling, and became professor

at Jena, Heidelberg, and Berlin, where he died in 1831. His principal works are: "Die Phenomenologie des Geistes" (1807); the "Logik" (1812-1816); an "Encyklopedie der Philosoph. Wissenschaften" (1817); "Philosophie des Rechts" (1821). He early in life turned his attention to social questions, writing (1797) a commentary on Stewart's "Inquiry into the Principles of Political Economy." Later he published various small works on the political constitutions of Württemberg and Germany, criticizing them and admiring Napoleon, "that universal genius." Living in the stirring times of the French Revolution, rejecting the idea of the Absolute, and conceiving of everything, even of God, as an eternal process, he thinks of society as developing through the individual, the family, the town, the State, the world, higher and higher unities, each unity, however, realizing and not destroying the lower unity. It is easy to see how he came to be the intellectual father of Marx and of most early German Socialists.

HELD, ADOLF: Political economist, born in Würzburg in 1844. He studied in Würzburg and Munich. In 1867 he became teacher, and in 1872 Professor of Political Economy at Bonn. In 1880 he was called to the university at Berlin, but was drowned on Aug. 25th of the same year. He was prominent as one of the Socialists of The Chair (q. v.). Among his best-known works are: "Die Einkommensteuer" (1872); "Die deutsche Arbeiterpresse der Gegenwart" (1873); "Grundriss für Vorlesungen über Nationalökonomie" (1876); "Sozialismus, Sozialdemokratie und Sozialpolitik" (1878).

HELICON HALL: In response to a call published in *The Independent*, New York, a meeting of about 300 people was held in Berkeley Lyceum, New York City, July 17, 1906. The object of the meeting was the establishment of a cooperative home. The Helicon Home Colony was subsequently organized by the persons interested. In October of the same year this organization secured nine acres and a half of land, with the buildings thereon, known as the Helicon Hall property, at Englewood, N. J.

The title to this property was taken by the Home Colony Company, a separate corporation, formed to raise the necessary capital. The company engaged to put the main building (Helicon Hall) in thorough repair and to equip it for use as a residence, and the colony rented the property from the company upon a three-year lease.

The Helicon Home Colony was a membership corporation governed by a board of directors elected for six months by secret ballot. The only conditions to residence in the colony were "congeniality" and freedom from contagious disease. One might reside in the colony indefinitely without becoming a member, but only members had the right to vote. The conditions of membership were one month's residence, election by a four-fifths vote, and the payment of an initiation fee of \$25. The constitution of the colony provided for initiative, referendum, and recall of members of the board of directors.

The colony believed that, by means of cooperation, the introduction of system and labor-saving machinery, household labor could be lifted to the rank of a profession and that people could be found to do such labor and, at the same time, be admitted to the colony as members. The ex-

perience of five months at Helicon Hall justified this belief.

The name "Colony" suggests "Brook Farm," "Ruskin," and similar cooperative experiments, but, as a matter of fact, all these colonies were experiments in cooperative production, while the Helicon Hall Colony was an experiment in cooperative distribution.

Helicon Hall was destroyed by a fire originating before daybreak on March 16, 1907. In this fire one life was lost and several persons were seriously but not fatally injured.

UPTON SINCLAIR.

HENDERSON, ARTHUR: English Labor M. P.; born at Glasgow, 1863; and on moving to Newcastle in 1875, apprenticed as a molder to Robert Stephenson & Co. In 1883 he joined the Friendly Society of Ironfounders, and in a short time was made an official. In 1894 was secretary of the North-Eastern Conciliation Board. His municipal work includes labor on the Newcastle City Council, Durham County Council, and Darlington Borough Council. A member of the Wesleyan Church for twenty-five years, he has filled nearly all the lay offices connected therewith. At a by-election in 1893, he was elected to Parliament the first Labor representative independent of the old parties. In 1903 he was Mayor of Darlington. In 1906 he was elected for Barnard Castle, Durham. Not a party Socialist, he is a strong believer in collectivist principles to be developed through the trade-union movement. Address: Teesdale, Atherfold Road, Clapham, S. W.

HENDERSON, CHARLES RICHMOND: Sociologist; born 1848, at Covington, Ind.; educated at public schools, (former) University of Chicago, Baptist Union Theological Seminary, Leipsic University. Pastor of churches at Terre Haute and Detroit until 1892, when he became Professor of Sociology at University of Chicago. President National Conference of Charities and Corrections in 1899; of National Prison Association in 1902; of National Children's Home Society. Associate editor of *American Journal of Sociology*. He believes in sociological science as an instrument of coordination of bodies of knowledge which in isolation would be sterile. He is the author of: "Social Elements"; "Introduction to the Study of the Dependent, Defective, and Delinquent Classes"; "Social Spirit in America"; "Social Settlements"; "Modern Methods of Charity," etc. Address: University of Chicago, Chicago, Ill.

HERBERGEN ZUR HEIMATH. See RELIEF STATIONS.

HERBERT, AUBERON EDWARD WILLIAM MOLYNEUX: English reformer; the son of the third earl of Carnarvon, born 1838. He left Oxford for the army, serving eighteen months in India, but returned, and took his degree, and for a year taught at Oxford. He then visited Denmark during the Prussian-Danish War, and the United States during the War of the Rebellion, becoming acquainted in camp with Generals Grant and Meade. His next few years were spent in London aiding working men in clubs. From 1870 to 1874 he was in Parliament for Nottingham. He went to France during the Franco-Prussian War. He left Parliament, coming to

believe, with Spencer, that the people needed to reconstruct their own conditions in life and not to depend on politicians. He has thus become an intense individualist, the editor of *Free Life*, the organ of Voluntaryism (q. v.), advocating the voluntary state and voluntary taxation. He published "The Right and Wrong of Compulsion by the State" in 1885. Address: Old House, Ringwood, Hants.

HEREDITY: The importance of heredity in questions of social reform is large, but cannot be briefly discuss, except in the most general terms. Scientific authorities have come as yet to few exact conclusions as to heredity, and even some of its fundamental characteristics are yet in dispute. (For the great Weismann controversy as to whether acquired characteristics can be transmitted to posterity or not, see EVOLUTION.) Of the bearing of this upon social reform, Professor Ely says (*Outlook*, 1893):

Recent studies of heredity appear also to give less importance to it, on the whole, than earlier ones. It is now frequently asserted by scientists that acquired qualities cannot be transmitted. An English economist says of Weismann, whose essays upon heredity are well known, that he has reopened the case for socialism. What he means is this, socialism lays emphasis almost entirely upon circumstances, and Weismann's investigations have so emphasized the importance of circumstances as opposed to heredity that once more the case for socialism requires discussion before the bar of public opinion.

In a recent letter Mr. C. Loring Brace, secretary of the Children's Aid Society of New York, said:

So far as we can judge, inheritance does not figure in the problem. . . . This society has placed 84,000 children in homes since it began this work forty years ago, and it is our experience that no matter what the parents may be, if the child is taken away at an age so early that it has not yet understood the wickedness about, if placed in a country home with kind and judicious adopted parents, it is almost certain to do well. . . . But if the child is not transplanted early enough, then there are the bad examples, bad habits, and knowledge of evil ways to contend against.

The last word of the scientists is in accord with the words of these practical scientists. The theory of heredity now held by Wallace, who shares with Darwin the credit of the hypothesis of natural selection, and by Weismann and the most eminent authorities, is that acquired characteristics of the parent do not pass to the child by inheritance.

A large majority of physicians also testify that most babies are born healthy, but early develop disease from improper care.

Dr. H. D. Chapin, in the *Forum* (March, 1894), gives the results of his studies:

Dr. Chapin is a physician to the New York Post-Graduate Hospital, and has made a record of 600 cases that came under his care. His object was to determine how far the disease of very little children were occasioned by heredity and how far by the conditions in which they lived. Most of the children were under two years of age, and nearly half under one year. At the time of birth, 508 of them were reported to have been in good condition, and only 20 were reported to have been in bad condition. In 12 cases the report was "only fair," and in the remaining cases there was no report. The children as a whole, therefore, seem to have started life well. What, then, had been their environment? It was found that in 106 cases the mothers were the sole bread-earners, and that in 88 cases the fathers were out of work when the children came to the hospital. Besides these there were 176 cases in which the mothers as well as the fathers were obliged to work. The results of this were very striking. "Two hundred and fifty-seven of the cases," says Dr. Chapin, "were deprived of maternal nourishment before the proper time, and 101 of the babies never received it at all. The usual reason was that the mothers were obliged to go out to work and remain away for too long intervals to care properly for their infants. As a direct result, a large number develop rickets, which is usually accompanied by a softening of the bones, together with great irritation of the nervous system. Almost all these diseases could have been prevented by proper diet and care, and yet when brought to the hospital they were frequently so far advanced as to result either in

death or in a more or less permanent crippling of a healthy life."

The result of this view upon social reform is thus summed up by Alex. MacKendrick (*Westminster Review*, 162, Aug., 1904):

The lesson for the social reformer which seems to grow out of these considerations is that we may cease attempting to control the hereditary or transmissible forces at the back of human life, as they lie far more deeply and are far more subtly interwoven with the primal law of things than we have imagined. We cannot "deal with existing heredity for the benefit of future heredities," as one writer has hoped. We cannot educate the race by educating its present representatives. We cannot moralize the next and unborn generation by the simple process of moralizing the present one. But what we can do, or could do if we would, is to prepare such an environment for the reception of the next generation as will mold it after a different shape—an environment in which the natural and beneficent force of parental affection will find room to realize itself, and in which the bitterness and despoli engendered by poverty and struggle will be eliminated.

Nevertheless, it must not be forgotten that *acquired* characteristics are transmitted, and that this heredity plays a very large part in life. W. Duncan McKim says ("Heredity and Human Progress," p. 120, 1900):

Heredity (in the broadest sense including transmitted specific tendency and deficient vitality) is the fundamental cause of human wretchedness. He quotes G. A. Dorsey as saying (*Science*, New Series, vi., 119, 1897): "Every human child at birth is endowed with the heritage transmitted from innumerable ancestors, and is already rich with impersonal experiences from its prenatal life. . . . These combined decide the individual's race and strain, and potentially incline, if they do not absolutely coerce, his tastes and ambitions, his fears and hopes, his failure or success." Prof. Angelo Messo is quoted as saying (Eng. trans. by E. Lough and F. Kleson, 1906): "Destiny loads each of us with a fatal inheritance. . . . We feel the breath, the advice, the experience of all men, from those who lived on acorns and struggled with the wild beasts, dying naked in the forest, down to the virtue and evil of our father, or the fear and love of our mother."

For a classic example of the influence of heredity, see JUKES. The well-known similarity of generation after generation of certain families, as in the English aristocracy, is well known, and tho this can be in part accounted for by each generation having much the same environment, instances of similarities between ancestors and descendants are found in every-day life, which environment will hardly account for. Only gradually is science, however, becoming able to accurately measure this influence. Francis Galton first attempted any general law. According to him the two parents contribute in general each one half, the four grandparents in general each one fourth, the eight great-grandparents one eighth, in heredity; in general the influence in heredity of any ancestral generation, he says, is inversely proportioned to the total number of individuals comprized in that generation. Recent investigators and writers, like Pierrson in England, DeVries in Holland, Cowens in Germany, Tschermak in Austria, Spellman in America, have made each some new progress in the investigation, but all witnessing to the fact and potency of heredity. But perhaps more than all has Mendel, working alone in his Augustan monastery at Brunn, Austria, contributed to the knowledge of the subject with his investigation of the transmission of dominant characteristics.

REFERENCE: See the works and authors quoted or named in this article. (See also EVOLUTION.)

HERRON, GEORGE DAVIS: Socialist lecturer; born, 1862, Montezuma, Md.; educated Ripon College, Wisconsin. Entering the Congregational ministry, he held pastorates at Lake

City, Minn., and Burlington, Ia. (1891-93). Becoming interested in social questions he wrote (1891), "The Message of Jesus to Men of Wealth," which at once aroused wide-spread interest, and led to his forming a social crusade by lecturing and preaching in the churches through all parts of the country. Passionate utterance and brilliant thought brought large and rapt audiences. In 1893 he was chosen to the Chair of Applied Christianity of Iowa College, Grinnell, endowed by Mrs. Rand. His views at this time were those of a radical and intense Christian Socialism, but as they continually grew more radical and extreme, great opposition was developed in religious circles culminating, in 1901, owing to Dr. Herron's separation from his wife and marriage to Miss Rand. Dr. Herron was deposed from the ministry, he, however, having already resigned his chair (1900) and renounced belief in Christianity as a distinctive religion. Dr. Herron has since worked only with the Socialist Party as lecturer and writer, recently residing for the most part in Italy. His main works are: "The Larger Christ" (1891); "The Call of the Cross" (1892); "The New Redemption" (1893); "The Christian Society" (1894); "The Christian State" (1895); "Between Caesar and Jesus" (1899).

HERTZEN, ALEXANDER: Born in Moscow, Russia, in 1812. Shortly after completing his education he was imprisoned for his outspoken views and banished to Viatka and Vladimir. On his return he devoted himself to literature, and in 1842 his "Dilettantism vs. Naukie" attracted attention. In the same year, for criticizing the police, he was ordered to live in Novgorod. In 1847 he obtained permission to travel, and in 1851 set up in London a *Free Russian Press* to attack the government and issue works forbidden in Russia, notably *Kólokol* (*The Bell*), started in 1857. Thousands of copies were smuggled into Russia and read by all, from the emperor to the peasants. After sympathizing with the Poles in their insurrection of 1863, he transferred the *Kólokol* to Geneva, where it had an obscure existence till about a year before Herten's death in Paris in 1870. He was romantic and skeptical, eloquent and satirical. He wrote various books and stories, his complete works being published in Basle in 1875.

HERTZKA, THEODORE: Economist; born in Budapest in 1845, and studied in Vienna. In 1872 he was editor of the *Neue Freie Presse*; in 1880 superintendent of the *Wiener Allgemeine Zeitung*. The same year he brought out his "Die Gesetze der Handelspolitik" ("Laws of Trade"), from the standpoint of the orthodox economy, which, however, he wholly gave up six years later in his "Die Gesetze der Sozialen Entwicklung" ("Laws of Social Evolution"). A still further advance is made in his utopia of "Freiland" (1890), in which he pictures a colony in equatorial Africa on the principles of communism. At the end of this volume he called for the creation of such a colony, and met with a large response. A central committee was organized, and in 1893 a start actually made. At the last, however, the difficulties were too great, and the plan failed.

HERZENSTEIN, MICHAEL YAKOVLEVITCH: Russian Duma leader; 1859-1906. Representative (Constitutional Democrat) from Moscow; of Jewish extraction. Graduate of the law

school of the Novorossiysk University (1881). Educated at the Heidelberg and Berlin Universities; adjunct professor of the Moscow University (1903). Professor of Political Economy of the Moscow Agronomical Institute (1904); chairman of the Moscow Municipal Council and Financial Committee. Member of the Moscow Province Zemstvo Society. Author of a series of works on economics.

HEYDEN, COUNT PETER ALEXANDROVICH: A Russian leader in the Duma; born 1846. Representative (Moderate) of the Pskov Province; leader of the Opochetz nobility. Graduate of the Mikhaeloff Artillery Academy. Ex-chairman of Free Economic Society. Member of the Zemstvo and City Deputation to Nicholas in 1905. An active member and chairman of all the large Zemstvo conferences.

HIGGINS, HON. HENRY BOURNES, K.C.: Member of the Australian Parliament for Northern Melbourne, Victoria; born at Newtownards, Ireland; educated at St. Stephen's Green College, Dublin, University of Melbourne (M.A.) (LL.B.). Scholar in languages and logic, history, political economy. Elected to legislature for Geelong in 1894-1901; 1897, he was member of the convention which framed the Commonwealth Constitution, and was returned to first House of Representatives for Northern Melbourne, 1901. Higgins was attorney-general of the Commonwealth in Watson ministry, 1904, and chairman of the Royal Commission for reform of legal procedure (1897-1899), and member of University Council. He founded a scholarship for poetry at Melbourne University. Address: 1 Selborne Chambers, Melbourne.

HIGGINSON, THOMAS WENTWORTH: Born in Cambridge in 1823; graduated from Harvard in 1841. Settled as pastor of the First Church in Newburyport, but, dismissed in 1847 because of his antislavery preaching, he organized the Free Church in Worcester, where he remained nearly six years, an enthusiastic worker against slavery and the intimate friend of Garrison and Phillips. He enlisted in the war in 1862, and served till seriously wounded in 1864. He was appointed colonel of the first regiment of colored troops enlisted in South Carolina. His great work, however, has been as essayist, author, poet, lecturer, and novelist. Some of his best writings have been his short essays contributed to *Harper's Bazar*. His lecture, "The Aristocracy of the Dollar," gave him a national reputation. His devotion to the cause of humanity led him to especially espouse the cause of the slave, and since then of woman emancipation from intellectual and political subjection. He was one of the first interested in Nationalism, and has even been called a Socialist, tho not committed to all its views. Living in Cambridge, Mass., he is prominent in public affairs and reform movements. Address: 29 Buckingham Street, Cambridge, Mass.

HIGH LICENSE: May be regarded as a license to sell liquors at what is regarded high rates, and intended thereby to reduce the number and improve the character of the places licensed.

In the early days of the temperance movement action was limited to "total abstinence for the individual and prohibition for the State."

The large city is the crux of the liquor prob-

lem, not only because of its size, but also because of the heterogeneous character of its population, the crowded condition of its tenements, and the lack of space which in so many cases prevents the observance of the ordinary decencies of life.

In 1883 I made the following statement from official sources:

CITY OF NEW YORK

| | |
|--|--------|
| Liquor sellers..... | 10,075 |
| Food sellers..... | 7,197 |
| Excess of former over latter..... | 3,878 |
| Arrests for crime during the year..... | 67,135 |
| Arrests for intoxication and disorderly conduct..... | 42,612 |

or 63.5 per cent of the whole.

Prohibition and restriction were the two possible remedial measures by law. In a city with so vast and heterogeneous a population the first remedy was promptly recognized as the dream of an enthusiast; the latter meant high license.

The High License Law of Nebraska was passed in 1881, and fixt the annual fees at \$500 for saloons in towns of less than 10,000 population, and \$1,000 for those containing more than 10,000 inhabitants.

In 1883 the Harper Law of Illinois fixt the minimum rate for the sale of malt liquors only at \$150 and \$500 for all kinds of liquors.

In the same year the Downing Law of Missouri fixt a minimum rate of \$550, and a maximum of \$1,000.

In Massachusetts the minimum license rate for the ordinary saloon selling all kinds of liquors on and off the premises is \$1,300.

In Minnesota \$500 for towns and \$1,000 for cities.

In Greater New York, under the old law, 1896, the number of liquor licenses granted were 15,357; under the new High License Law of 1903, the number was reduced to 12,827.

There is now an effective Excise Department for the State of New York located at Albany, and of which the Hon. Maynard N. Clement is the chief officer.

From the report of 1904 we quote the following points:

"When the liquor tax law (high license) took effect, March 23, 1896, there were 33,437 licenses granted in the state. On Jan. 10, 1902, the number of liquor-tax certificates in force in the state was 26,436, a reduction of over 7,000, or more than 20 per cent, in the number of places authorized to sell liquor.

"According to the reports of the State Commission of Prisons, the number of commitments for drunkenness has fallen from 53,200 in 1897, to 33,203 in 1901, a reduction of nearly 40 per cent.

"From the same authoritative source it appears that the number of criminals confined in the state prisons in 1890 was 3,508, increasing until 1895, when it reached 3,721, but diminishing through the years since the passage of the Liquor Tax Law to 3,375 in 1900.

"The total population of the state jails, penitentiaries, reformatories, and state prisons in 1896 numbered 12,661, but in 1900 it had fallen to 10,761.

"During the period from 1890 to 1900 the population of the state has increased from 5,997,853 to 7,268,012, being 1,270,159 persons, or 21.2 per cent.

"Reasoning from analogy, it was to be expected

that the criminal statistics would steadily increase during the whole decade, in line with the increase of population, even as they did during the first five years, but some great restraining and corrective force has made itself felt during the last half of the period, producing the surprisingly improved results. That restraining and corrective force has been high license."

ROBERT GRAHAM.

HILDEBRAND, BRUNO: Economist; born at Naumburg, Prussia, in 1812. Studying philosophy, he was implicated in the affair of the *Burschenschaften* (corporations of students suspected of liberalism); he succeeded, however, in being appointed Professor Extraordinary in the University of Breslau, then at Marburg (1841), where he published some years later (1848) the first volume of "Die Nationalökonomie der Gegenwart und Zukunft." He was the same year chosen deputy from Marburg to the National Assembly at Frankfurt, and his attitude was so hostile to the government that he was exiled to Switzerland. At Zurich he was appointed Professor of Political Economy. He had already created at Marburg a bank for widows (*Witwen casse*); and he founded at Berne the savings and loan bank. After he left Zurich (1861) he occupied the chair at Jena (1862), and in 1862 founded the "Jahrbücher für National Economie und Statistik." After 1873 he edited this journal in connection with Conrad, his son-in-law. He died at Jena, Jan. 29, 1878, a leader in the historical school (q. v.).

HILL, OCTAVIA (MISS): Philanthropist; born in England; educated at home. Early became interested in social and charitable work in London; in 1864 she first took charge of the management of homes for the people. She collects rent for the owners of houses and tenements all over the city, and uses her work as an opportunity for aiding those from whom the rent is collected in cleansing and bettering their tenements and in improving the whole environment of their lives. Begun as an experiment, the scheme has grown until now Miss Hill and her assistants have the care of between five and six thousand dwellings. Miss Hill has been connected with many of the societies which are working for a greater and a better London almost from their commencement. Among them, the Charity Organization Society, The Commons Preservation Society, Kyrle Society, Women's University Settlement, and the National Trust for Places of Historic Interest and Natural Beauty. She is the author of "Homes of the London Poor," "Our Common Land," and various articles published in magazines. Address: 190 Marylebone Road, N. W., London.

HILL, SIR ROWLAND: Father of cheap postage; born Kidderminster, 1795. After his own education taught in his father's school till 1833, then joined the association for establishing the colony of South Australia on Mr. Wakefield's scheme of colonization (see AUSTRALIA), and became secretary to the Royal Commission on the colony. In 1837 he published his famous pamphlet advocating cheap and uniform postage. In 1840 a uniform rate of 4d. per letter was adopted, soon after reduced to 1d. Mr. Hill was placed in the treasury to work out his plan, but was soon dismissed by a Tory government which came into power. In 1846, however, the Whigs

returned to power, and Mr. Hill was made secretary to the postmaster, and in 1854 secretary to the post-office, an appointment he held till failing health compelled him to resign in 1864. He died in 1879.

HIRSCH, JENNY: German author and reformer; advocate of woman's advancement; born at Zerbst, 1829. She wrote in Berlin (1860-64) under the name of J. N. Heynrichs. In 1865 she was a member of the Woman's Congress at Leipzig, and since then has written, besides many tales, numerous works on woman's advance. She died in 1902.

HIRSCH, MAURICE, BARON DE: Austrian Jewish financier and philanthropist; born at Munich, 1831. He inherited his father's fortune (1860) and became associated with the banking firm of Bischoffsheim & Goldsmid, Brussels. Making large profits by building railways in Rumania and Turkey, his fortune was estimated at \$200,000,000. He gave about \$100,000,000 during his life mainly to Jewish charities, and the Baroness \$15,000,000 more at her death (1899). He gave not less than \$50,000,000 to establish Jewish colonies in Argentina and \$2,500,000, increased by his wife to \$3,700,000, to educate and Americanize Russian and Rumanian Jews. He died April 21, 1896.

HIRSCH, MAX: German economist and reformer; born 1832, at Halberstadt, in Prussian Saxony. Studied political economy and jurisprudence at Tübingen, Heidelberg, and Berlin, and traveled extensively in France, England, and North Africa. He has since devoted himself to organizing trade-unions in Germany and in societies in the interests of the working classes. He was elected several times to the Reichstag.

HISTORICAL SCHOOL: A school of political economists which arose in Germany, in reaction from the theorizing of the English school of *laissez-faire* as developed in Ricardo and his followers. Most economists rightly object to being classed in this or any other "school," preferring to be catholic in their views and unfettered by designation of belonging to any school. Yet this school has many sympathizers. The school is in the main inductive, where the Ricardian economy is deductive. It owes its rise very largely to the influence of Comte and the Positivists.

Roscher, Bruno, Hildebrand, and Karl Kries may be said to be its four German founders. (See their names.) The school has always had a marked leaning toward State socialism in reaction from individualism. Says Professor Ingram ("History of Political Economy," p. 207):

The historical method has exhibited its essential features more fully in the hands of the younger generation of scientific economists in Germany, among whom may be reckoned Lujo Brentano, Adolf Held, Erwin Nasse, Gustav Schmoller, H. Rösler, Albert Schäffle, Hans von Scheel, Gustav Schönböck, and Adolf Wagner. Besides the general principle of an historical treatment of the science, the leading ideas which have been most strongly insisted on by this school are the following: I. The necessity of accentuating the moral element in economic study. This consideration has been urged with special emphasis by Schmoller in his "Grundfragen" (1875) and by Schäffle in his "Das gesellschaftliche System der menschlichen Wirtschaft" (3d ed., 1873).

The two other ideas which Professor Ingram considers prominent in the historical school are a close relation between economics and jurisprudence, and the conception of the State as the organ of the nation for any end that may seem desirable, a view lending itself very easily to State socialism.

HOBBS, THOMAS: Born at Malmesbury, 1588, the son of a clergyman, he went to Oxford at the age of fifteen. He became tutor in the family of the Earl of Devonshire, and acquainted with Bacon, Raleigh, Ben Jonson, and other distinguished men. It was not till he had reached the age of forty that he published, in 1628, his first work, a translation of "Thucydides."

His first original work was "Elementa Philosophica de Cive" (1642). In 1651 he published the "Leviathan," the fullest and perhaps the best-known exposition of his views on mind, politics, morals, and religion.

A friend to royalty, his views were condemned by Parliament in 1666, and he was in danger of still severer measures. His last works were a translation of Homer and a history of the civil wars. He died Dec. 4, 1679.

HOBSON, JOHN ATKINSON: Economist; University extension lecturer; born 1858, at Derby, England; educated at Lincoln College, Oxford. From 1880 to 1887 he was classical master at Faversham and Exeter, and from 1887 to 1897 Lecturer on English Literature and Economics for the London Society for the Extension of University Teaching, and the Oxford University Delegacy. Hobson is a Fabian Socialist. One of the founders and editors of *The Progressive Review*; a frequent contributor to *The Contemporary* and *Westminster* and other reviews. He has written: "Problems of Poverty"; "The Evolution of Modern Capitalism"; "The Problem of the Unemployed"; "John Ruskin, Social Reformer"; "The Economics of Distribution"; "International Trade"; "The Social Problem," etc. He is coauthor with A. F. Mummery of "The Physiology of Industry." Address: Elmstead, Limpsfield, Surrey, England.

HODGE, JOHN: English Labor member of Parliament; born 1855, Muirkirk, Ayrshire, Scotland; educated at the Hutchesontown Grammar School, Glasgow. He took an early interest in labor matters, and in 1886 became secretary of the Steel Smelters' Association. To his efforts are due the success and progress of the Association. In 1892 he was president of the Glasgow Trades Council, also president of the Trades Union Congress. In 1898 he was elected to Manchester City Council. He has written many pamphlets and articles. He was elected to Parliament as member for Gorton (Lancashire) in 1906. Address: Ormond Mansions, Great Ormond Street, London, W. C.

HOLLAND. See NETHERLANDS.

HOLLAND, CANON HENRY SCOTT: Canon of St. Paul's, London, and chairman of the London Christian Social Union; born in Ledbury, Herefordshire, England, in 1847, and educated at Eton and at Balliol College, Oxford. After some years of residence at Oxford as student of Christ Church, he became canon of Truro (1882), and of St. Paul's, London (1884). He is one of the leaders in the Anglican Church. Besides his notable share in "Lux Mundi," he has written many books, such as "In Behalf of Belief" and "The City of God." He was principal founder of the Christian Social Union (q. v.) in 1889, and is chairman of the energetic London branch of the union, and editor. He is in politics and

reform an outspoken leader in Anglican Christian Socialism.

HOLLANDER, JACOB H.: Economist; born Baltimore, 1871; graduate of Johns Hopkins University, 1891. He was appointed associate professor of finance and held the position till 1901 when he became associate professor in political economy, 1901-4, and professor in 1904. He was head of the political economy department of the university. In 1897 Hollander was secretary of the Bimetallic Conference abroad. Appointed President McKinley treasurer of Porto Rico 1900-1901, he organized the revenue system ("Hollander Law"). He investigated the finances of San Domingo for President Roosevelt, 1905, and was special agent of the State Department 1906-7. Author of various economic studies on finance and taxation. Address: 335 Dolphin Street, Baltimore.

HOLST, HENRIETTE ROLAND: Author; Socialist; born, 1869, at Noordwyk, Holland; first work published in 1895; joined Social Democratic Labor Party in 1897, and has worked devotedly in the propagation of the principles and ideals of Socialism. Mrs. Holst stands for "orthodox, uncompromising Marxism, understood not only as a political opinion, but a general philosophy." She is the author of "Capital and Labor in Holland," "The General Strike and Social Democracy," "Sonnets," "Poems," etc. Address: Laren, Holland.

HOLYOAKE, GEORGE JACOB: Historian of cooperation; born in Birmingham, England, in 1817. The son of an iron-worker, he was educated in the Mechanics' Institute and taught mathematics. In 1837 he heard Robert Owen, and became one of his "social missionaries" stationed at Sheffield. In 1841, in lecturing at Cheltenham, he gave a novel turn to a Bible passage, and was imprisoned six months for blasphemy. He was sometimes called the father of secularism, being neither theistic nor atheistic. For several years he edited *The New Moral World*, and then for fifteen years *The Reasoner*. To abolish "the taxes on knowledge" he printed an unstamped newspaper till his fines amounted to £600,000. Becoming interested in cooperation, he identified himself with the cause, and published "The History of Cooperation in Rochdale," which is said to have led to the formation of 250 co-operative societies. His "History of Cooperation in England" (2 vols.) appeared in 1875-1878; "The Rochdale Pioneer" in 1882. Besides these he has written numerous tracts and papers and innumerable newspaper articles on cooperation and on secularism. His life is told in "Sixty Years of an Agitator's Life" (1892). Died 1906.

HOME COLONY: Home, Wash., "the only anarchist colony." In 1896 three families moved from a disrupted Socialist colony at Glannis, Wash., and without any plan of organization bought adjacent land and commenced a more or less communal life. Other families came and, in 1898, a landholding association was formed. It had as its only rules that no more than two acres per individual should be allowed any person or family, that the title should be held by the association simply to prevent the land being sold in larger quantities, but that the association should

sell, without any other restriction, the use and occupation of the land (including the right of resale), and should sell this for just what the land cost. Beyond this the association does nothing and there is no community, government, authority, or law, except that the association pays the taxes and distributes them according to the landholding and conducts a school under the state law. All improvements are made by the voluntary contribution of those who desire them. A store is also conducted by voluntary cooperation. People are free to marry or to practise "free love," and the views of the community are said to be about equally divided on this subject. There is no law as to saloons or crime, tho there is no saloon and little drinking or evil of any kind. The community has steadily grown and (1907) numbers about 150 persons. At first much criticized, their quiet life has made almost all in the neighborhood friendly to them. Agriculture is the main occupation, though there is carpentry, blacksmithing, and logging. Dissensions arise, but each family is so independent that these differences do not seem to last and the community seems after ten years to be growing in stability. Voluntary cooperation is encouraged. Meetings are held Sundays for ethical, economic, or other addresses and discussions. A little paper is published, *The Demonstrator*. Address: Home, Lakebay P. O., Washington.

HOME RULE. See IRISH HOME RULE.

HOMES, OWNERSHIP OF (for other countries, see LAND): In the United States only are there official statistics available on a large scale as to the ownership of homes. (See also HOUSING QUESTION; OVERCROWDING; TENEMENTS.)

OWNERSHIP OF HOMES IN THE U. S., 1890 AND 1900

(All these statistics are from the census, 1900)

| KIND OF FAMILY | Number of families | PER CENT OF FAMILIES HAVING HOMES— | | |
|---------------------|--------------------|------------------------------------|------------|-------|
| | | Owned | | Hired |
| | | Free | Mort-gaged | |
| 1900 | | | | |
| All families..... | 16,187,715 | 31.8 | 14.7 | 53.5 |
| Farm families..... | 5,698,901 | 44.4 | 20.0 | 35.6 |
| Other families..... | 10,488,814 | 23.4 | 12.9 | 63.7 |
| 1890 | | | | |
| All families..... | 12,690,152 | 34.4 | 13.4 | 52.2 |
| Farm families..... | 4,767,179 | 47.3 | 18.6 | 34.1 |
| Other families..... | 7,922,973 | 26.7 | 10.2 | 63.1 |

A "family," according to the census, is any "group of individuals who occupy jointly a dwelling-place or part of a dwelling-place or for any individual living alone in any place of abode." A "family" may include all the occupants and employees of a hotel, cabin, tent, factory, or stable, if they habitually sleep there.

The totals for the 160 cities of continental U. S. having at least 25,000 inhabitants are as follows: Families having home, owned, total, 1,027,256; free, 561,664; mortgaged, 435,233; unknown, 30,359. Families having home, hired, 2,970,107; tenure unknown, 139,916. Per cent of families having home, owned, total, 25.7; free, 14.5; mort-

gaged, 11.2. Per cent of families having home, hired, 74.3.

OWNERSHIP OF HOMES IN REPRESENTATIVE CITIES, 1900

| CITY | PER CENT OF FAMILIES HAVING HOMES— | | | |

| Providence, R. I..... | 21.0 | 11.0 | 10.0 | 79.0 |
| St. Louis, Mo..... | 22.8 | 14.2 | 8.6 | 77.2 |
| St. Paul, Minn..... | 29.9 | 19.8 | 10.1 | 70.1 |
| Salem, Mass..... | 29.6 | 18.0 | 11.6 | 70.4 |
| Salt Lake City, Utah..... | 40.0 | 29.1 | 10.9 | 60.0 |
| San Antonio, Tex..... | 38.0 | 33.2 | 4.8 | 62.0 |
| San Francisco, Cal..... | 24.1 | 16.0 | 8.1 | 75.9 |
| Washington, D. C..... | 24.2 | 16.1 | 8.1 | 75.8 |
| Worcester, Mass..... | 24.9 | 8.7 | 16.2 | 75.1 |

In 1900 only 46.5 per cent of the families, or less than one half of the families of our country, owned their own homes; only 32 per cent, less than one third, owned un-mortgaged homes. From 1890 to 1900, the number of families owning their own homes, free or mortgaged, fell from 47.8 to 46.5 per cent. Of farm families, in 1900, 64.4 per cent owned a home and only 44.4 per cent an un-mortgaged home. The number of families owning farms free or mortgaged fell from 65.9 in 1890 to 64.4 in 1900, and those owning un-mortgaged farms fell from 47.3 in 1890 to 31.8 in 1900. Other homes free or mortgaged fell from 36.9 in 1890 to 36.3 in 1900; un-mortgaged homes other than farms, fell from 26.7 to 23.4 per cent. From 1890 to 1900 farm tenants increased from 34.1 to 35.6. Other tenants increased from 63.1 to 63.7.

These statistics, however, must not be pressed. A mortgage on a home often means a family of immigrants who buy a home but put a temporary mortgage on it till they can pay it off. Or it may mean a newly married couple; or in a hundred ways may mean the gaining and not the losing of a home.

TENURE OF FARMS BY DIVISION

HOMESTEAD AND EXEMPTION LAWS:

Provisions of law by which homesteads are secured beyond reach of creditors or liabilities on the part of their owners are of modern growth. The Homestead Law of the United States, tho long agitated and several times passed by the House of Representatives, and tho antedated by the like laws of several states, was not enacted by Congress till May 20, 1862. Altho often abused (see PUBLIC DOMAIN), it has proved one of the most beneficent as well as successful laws ever passed. It has opened up to immediate settlement millions of acres of public lands, and has attracted to this country millions of our best citizens. By its provisions any citizen or applicant for citizenship over twenty-one years of age may enter upon 160 acres of any unappropriated public lands, graded at \$1.25 per acre, or eighty acres of such lands, valued at \$2.50 per acre, by the government, on payment of the nominal fee of \$5 to \$10. After five years' actual residence on the land, a patent thereof is issued to the settler by the general land officer at Washington. This patent is a valid title from the U. S. If the purchaser wishes to complete his title in less than five years, he can only do so by purchase. No individual is permitted to acquire more than 160 acres, tho there is no limit to the amount he can purchase. There is a proviso that no lands acquired under the Homestead Act can be liable for any debts of the settler contracted before the issuing of the patent for his homestead. (See PUBLIC DOMAIN.)

HOMESTEAD STRIKE: In July, 1892, a serious difficulty arose in the iron and steel works of Messrs. Carnegie & Co., Homestead, Pa., employing several thousand men. Wages had been for many years fixt in these works by a sliding scale based upon the selling price of steel billets. (See AMALGAMATED ASSOCIATION OF IRON AND STEEL WORKERS.) The scale agreed upon in 1889 was to expire on June 30, 1892; and when that date approached, the owners gave notice of a desire to reduce the basis from \$26.50 a ton to \$23, and to make the scale terminable at the beginning of January instead of at the beginning of July. To this the employees objected, because in the middle of winter they could not afford a cessation of work, and would not be in a position to resist any unwelcome demands made by the employers. The number of men actually affected by the cut-down was not large, but the delegates of the

Amalgamated Association of Iron and Steel Workers, in the name of the employees, rejected the proposed scale. The employers retaliated by formally discharging all who refused their terms and announcing that they would hold no further negotiation with the association as such. Carnegie & Co. had provided against the contingency of a strike or lockout during the previous six weeks by building a fence around the works three miles long and 12 ft. high upon a parapet 3 ft. in height, and covered with barbed wire, so that the operatives called the works Fort Frick. Three hundred Pinkerton constables were brought by water to the works. They were introduced into the state unarmed, but brought arms and ammunition with them packed in boxes. A large body of strikers were in waiting to prevent their landing, having taken possession of the works. The testimony is conflicting as to which party fired first, but a skirmish ensued with a heavy volley of shots from the strikers, in which seven of the Pinkertons and strikers were killed and many others wounded. The struggle continued two days. On the opposite bank a brass ten-pound cannon was obtained and fired on the barges. The crowd also attempted to set fire to the barges by pouring burning oil upon the river, and finally the Pinkertons surrendered, and were imprisoned in a rink until evening, when they were got away from the town by rail. On their way to the rink and to the station they were beaten and maltreated in spite of the efforts of the strike leaders to control the crowd, which was largely composed of Slavs, Hungarians, and women. Troops were sent to Homestead by the Governor of Pennsylvania and stationed there many weeks, the town being put under martial law. Great severity was displayed. Eleven workmen and spectators were killed in the fights. Some of the leaders were arrested and order was restored; for tho the manager, Mr. Frick, was afterward shot at by a Russian named Berkmann, this act seems to have been quite independent of the men on strike. For an unguarded expression of sympathy with Berkmann, a private (James) was strung up by his thumbs and flogged. After about six weeks a large number of the strikers returned to work, but a number of new men were subsequently engaged by the company, and many of the strikers did not return. A committee of Congress, appointed to investigate the employment of Pinkerton detectives, held an inquiry at Pittsburg into the circumstances of the strike. The evidence

given before them showed that a conviction prevailed among the men, that since the introduction of the McKinley tariff the profits of the company had increased, and that there was, therefore, no occasion for any such reduction of wages as they proposed. Further, the strength of the feeling against the employment of Pinkerton special constables found general expression. Great excitement over the strike was roused through all the country. Subscriptions were raised by working men to support the strike. Lawyers were sent on to defend the strikers against persecution for using arms to defend their homes against "foreign invasions." The feeling against the Pinkertons ran very high. In Massachusetts an act prohibiting the employment of Pinkerton constables was passed in 1892, and a similar act was passed in New Jersey during the same year.

HOMICIDE. See CRIME (pages 333-335).

HOPEDALE: Formerly a Christian Socialist community, now an industrial "model village," near Milford, Mass. The founder of the community was the Rev. Acton Ballou (*q. v.*). Its first compact dates from Jan., 1841, before Brook Farm; but the community did not actually commence operations till April, 1842. Hopedale lasted much longer than Brook Farm, continuing till 1856 or 1857. In 1854 it was at its highest point of success and hopefulness. The community was originally called Fraternal Community No. 1, and numbered about thirty individuals.

By 1851 the community came to own about 500 acres, consisting of about thirty new dwelling-houses, three mechanic shops, with water-power, carpentering and other machinery, and a small chapel used for educational and religious purposes. At the same date it had about thirty-six families, besides single persons—some 175 persons in all. A tract written by Mr. Ballou in 1851 says:

"It is a socialistic community, successfully actualizing, as well as promulgating, practical Christian socialism—the only kind of socialism likely to establish a true social state on earth."

Its high hopes were for a time realized. Acton Ballou worked faithfully to carry them into effect. That they finally failed was no fault of Mr. Ballou. At first Mr. Ballou was the head of the community, but ultimately he was superseded by a Mr. G. D. Draper, an enterprising business man who became the business spirit of the whole community, who had a brother in business with him who had no sympathy with the community. Mr. Draper became more and more interested in lucrative outside concerns. Meanwhile, he had bought up three fourths of the joint stock. Finally, becoming dissatisfied with the community, he paid the debts and compelled its suspension.

The Drapers (cotton machinery makers) have, however, now developed in place of the old community attractive homes for their employees. A large share of the 3,000 men live in homes put up and owned by the company. They are finished for the most part in unstained wood, tastefully and conveniently designed. The streets are lined by small lawns or flower beds without fences; there is a park of some 150 acres, with six acres of playground, so that the whole is quite

attractive. Water, gas, electric light, baths, with good drainage, are provided for nearly all the houses. A comfortable home can be hired for \$6 a month. Better houses can be had for from \$10 to \$20 a month.

HOSPITALS: Hospitals are among the most ancient forms of relief institutions. There were hospitals in India and Persia before the Christian era. The Greek temples of *Æsculapius* served as places to which the sick were brought for relief. So more or less with the sacred places of all early races, civilized and uncivilized. The first hospitals apart from these were probably founded by the Christian churches, like the great one founded by Basil in Cesaria about 375 A.D., with rooms for lepers as well as other invalids. From this time they multiplied rapidly. One of the earliest still existent is the great *Hôtel Dieu* of Paris, dating probably from the seventh century. During the crusades many hospitals were built, including two at Jerusalem, and the knights who attended these were called hospitalers. The sisters of charity were also active in developing them at Lyons, France. Hospitals were early connected with the universities, notably at Bologna, and in London (St. Bartholemew's, 1596; Bethlehem, 1547; St. Thomas's, 1553).

The oldest large hospital in the United States is probably the Pennsylvania Hospital (1750), and the second, the New York Hospital (1771).

They now exist in all cities and are of very many kinds. The annual number of patients in the Middlesex Hospital, London, is over 2,000, while it treats annually some 18,000 in their homes. The Johns Hopkins Hospital of Baltimore was endowed by Mr. Hopkins (1873) with \$4,500,000.

There were in the U. S. in 1903 1,493 hospitals with 156 dispensaries and 166 nurseries. Of the hospitals 822 had been established since 1890. The inmates Jan. 1, 1905, numbered 71,530, of whom 24,000 were in public hospitals, 23,965 in private, and 23,564 in ecclesiastical. The cost of maintenance in 1903 was \$28,200,867, of which \$2,276,336 came from public funds for private and ecclesiastical hospitals, besides \$6,606,085 for the public hospitals. Of the ecclesiastical hospitals, \$1,344,932 came from public funds and \$611,461 from pay inmates.

Prussia had (1885) 1,593 hospitals with 80,401 beds; that is, 28 beds per 10,000 population. The state owned 18.1 per cent of the hospitals and 26.4 of the beds; and treated 33.1 of the patients. The hospital at Friedrichsheim, near Berlin, built in 1870-74, has 600 beds in 12 buildings, and cost 4,594,229 marks; that is, 7,455 per bed.

HOTEL AND RESTAURANT EMPLOYEES OF AMERICA, INTERNATIONAL ALLIANCE OF, AND BARTENDERS' INTERNATIONAL LEAGUE: One of the larger unions in affiliation with the American Federation of Labor. The alliance was formed as a national union in 1890 out of four locals. The alliance and league reported in 1905 38,700 members, and paid that year in death benefits \$22,700.

HOURS OF LABOR (see also EIGHT-HOUR MOVEMENT; EIGHT-HOUR PHILOSOPHY; CHILD LABOR; SWEAT-SHOPS; TRADE-UNIONS; WAGES): In this article we give information as to the hours

commonly prevailing in different trades and countries. It must be remembered, however, that such statements can be made, as a rule, only for trades investigated by the Labor and Statistical Bureaus of the different countries, and that these are, and almost of necessity must be, only the larger and better organized trades. Hence, the hours here given must *not* be taken as typical for the numerous shops, stores, and small factories which are ill organized, nor for even the great department and other stores and the factories employing girls and others only to a small extent in trade-unions. Article Trade-Union will show how close is the connection between the trade-union and short hours. Hence, where unions are not found or are weak, hours are almost always long. (For the worst cases, see SWEAT-SHOPS.) In very many cases, however, by no means to be called sweat-shops, hours, as in many stores and some factories, are much longer than in most of the trades reported in these statistics.

HOURS OF LABOR IN FACTORIES AND TRADES, U. S., 1904

¹ The average is obtained by dividing the aggregate number of hours worked during the week by all the work people

¹ The average is obtained by dividing the aggregate number of hours worked during the week by all the work people to whom the figures relate, by the number of work people.

Hours of labor in other countries are usually longer than trade-union hours in the U. S. But outside of these trades, conditions are so different, it is impossible to make comparisons.

The following table is compiled from an English report on foreign labor statistics, issued by the Board of the Trade, 1906:

HOUSE OF DAVID, THE: Name of an Israelite religious community at Benton Harbor, Mich., U. S., established in 1902 by "Mary and Benjamin," religious leaders of a peculiar faith derived from the Hebrew Scriptures. They state that their numbers are to total 144,000, and believe that the Lord is now setting His hand the second time to gather His people, the first time being by Moses and the second time now, and that this necessitates the sounding of the seventh angel. They claim that the seventh angel or messenger is now sounding in Benjamin and Mary, the woman included, for the man is not without the woman, nor the woman without the man in the Lord. Six other angels or messengers they claim have already sounded and passed away, but that this is according to the Scriptures, for

the Lord will only have one standard on the earth at once.

Their followers (1907) number about 500 and practise strict communism. On attractive grounds they have several large living buildings, with electric light and steam heat, an auditorium, cannery and drying house, steam laundry, carpenter shop, tailor shop, coach factory, stables and barns, automobile-house, power-house, etc.

The occupation is mainly fruit-raising and they have about 1,000 acres under cultivation, being among the best fruit farms of the district. They do a successful business running into the hundreds of thousands. They give much attention also to education and to music, having five bands. They have a large printing-house, considered a spiritual ark (whence the false report that they are building a new ark). They produce much propaganda literature and publish a paper, *Shiloh's Messenger of Wisdom*.

HOUSING IN GREAT BRITAIN, THE NEED OF: According to Sir Robert Giffen, no fewer than eight millions of persons in the United Kingdom—one fifth of the whole population—exist under conditions represented by a family income of less than a pound a week, and constituting not merely a disgrace, but a positive danger to our civilization. Dealing with this statement, Mr. Sidney Webb says these eight millions are "housed, washed, and watered worse than our horses." Of these eight million people improperly housed, Sir Walter Foster, president of the Land Law Reform Association, estimates that nearly half are living in dwellings which ought to be pulled down. He says a very careful calculation has been made, showing that 690,000 English houses now occupied in town and country are so bad and rotten as to be utterly beyond repair. Lord Avebury recently told the London Chamber of Commerce that there are no fewer than two and a half millions of people living in London for whom better workmen's dwellings are required.

Mr. Johnstone Wallace, one of the public men of Newcastle, thus describes the housing conditions of that city: "Everywhere throughout the city cellars and garret dwellings are in common use, particularly in one part of the town, and the wretched character of the accommodation in some of them is enough to drive the poor occupants to despair." It is shown in Dr. Tathan's report to the Registrar-General, that some 11,000 people live in 3,288 cellars in Liverpool, and that that city possesses 1,432 courts and alleys, and 8,184 insanitary houses. The doctor adds: "The death-rate for children under five years is twice as high in Liverpool (114½) as the average of England (59). To Liverpool belongs the distinction of being the most unhealthy place for little children in the whole country."

Miss Bentham, a lady sanitary inspector in Middlesborough, a large manufacturing town, says: "Owing to the want of set pots and facilities for washing in the houses, more especially in the poorest districts, it was most difficult to obtain cleanliness either of the people or of their clothing. Out of 600 visited, 483 had no facilities either for washing the clothes or the persons of the inmates, and the charges at the corporation baths were higher than these people could afford."

The Chief Sanitary Inspector of Glasgow, Mr. P. Fyfe, at a public meeting, stated that there were 7,000 people living in that city in open violation of the health laws, and yet the authorities

dared not take action. On a later occasion the same inspector, in a lecture on "Back Lands and Their Inhabitants," delivered before the Glasgow Association of House Factors and Property Agents, said: "Darkness and dirt are as mother and daughter in the dingy back land, and no police regulations that were ever made, or soever put into execution, will bring sweetness out of, or put sweetness into, slums. Therefore the cry of 50 per cent of our poor, who, I believe, wish to be clean, goes up in what Carlyle calls the huge inarticulate question—'What do you mean to do with us?'"

England has overcrowded slums in its villages as well as in its towns. Among the main reasons why country people flock into towns are the want of the scarcity of cottages in their native villages, and the foul and overcrowded state of so many country homes. The tale comes from all over the country that the villages are fast becoming villages of old people. The manhood and vigor from the countryside that hitherto have stood for England's staying powers are spending themselves in the towns. The nation's reserve is rapidly being exhausted. The low wages paid to agricultural laborers have something to do with this rural depopulation, but the want of houses to live in—a want felt far more keenly in many villages than in many towns—is the greater cause. With all this desertion of sturdy men and women from the country, the homes they leave behind are far from adequate even for the people remaining. The cottages are rotting away faster than the people are running away.

As a result of a careful inquiry carried out by the Land Law Reform Association, it was found that in sixty-seven villages, containing 3,739 cottages, one fifth of the cottages were in such a state as to be described not only as insufficient, but bad or extremely bad. Of these cottages, 61 per cent had bedrooms without fireplaces, and therefore could have no proper or healthy ventilation, and in one seventh the water-supply was either bad or there was none at all. More recently the association conducted another inquiry over 240 villages, embracing about 10,000 houses. Quite half of the cottages were described as bad, and in many cases they were overcrowded in the grossest manner. Since 1891 the rural population has declined by nearly 10 per cent, and in some country districts the decline is at the rate of 15, and even 17 per cent.

In a paper read before the Central Poor Law Conference on "Pauperism and Overcrowding," Mr. William Crooks, M.P., estimates, from carefully compiled returns, that overcrowding among the poor is responsible for an additional expenditure under the Poor Law of no less a sum than £134,000 in London. This figure refers to the cost of maintenance only, and takes no account of the enormous expenditure in providing and administering the large institutions to which so many of the overcrowded poor are finally driven.

As regards pauper lunatics, Mr. Crooks quotes the last return as showing that the ratio per thousand inhabitants in London varies from 1.9 in the healthy districts to 10.1 in the overcrowded quarters. These additional numbers, brought about by overcrowding, not only cost £70,000 a year to maintain, but necessitate the expenditure of £500,000 on a new asylum. **GEORGE HAW.**

HOUSING QUESTION, THE (for the ownership of homes, see **HOUSES**; for the evils of over-

crowding, see **HOUSING IN GREAT BRITAIN, NEED OF; OVERCROWDING; POVERTY; TENEMENTS**; for special solutions of the problem, see **BUILDING AND LOAN ASSOCIATIONS; GARDEN CITIES; MODEL VILLAGES; MUNICIPAL DWELLINGS**): In this article other efforts to provide better housing for the working classes are treated.

I. THE UNITED STATES

The first "model dwelling" in the U. S. was erected in New York City in 1855 by "The Workmen's Home Association," organized by the Association for Improving the Condition of the Poor. It soon became, however, one of the worst tenements in New York. In 1876 Mr. Alfred T. White, of Brooklyn, began some private experiments in improved tenements, which were so successful he induced others to cooperate with him, which led to The Improved Dwellings Company of Brooklyn, which have erected the Home, Tower, and Riverside Buildings, the older buildings paying 10 and the newer 6 or 7 per cent. In 1879 the Improved Dwellings Association was formed in Manhattan, and erected an excellent group of buildings on First Avenue in Manhattan, still in good condition and having earned 5 per cent each year. In 1896, the City and Suburban Homes Company was formed, under the leadership of Dr. E. R. L. Gould, which has erected four groups of buildings.

The present investments of the company are a little over \$4,000,000, and 1,238 families are housed in its city blocks at rents from \$1.60 to \$4.60 per week.

The company owns three large groups of model tenement buildings for white people and one smaller model tenement building for colored people in Manhattan, accommodating in all 1,238 families, and a suburban estate called "Homewood" (see **MODEL VILLAGES**) in the thirtieth ward, Borough of Brooklyn, thirty-five minutes from New York City Hall, comprizing about thirty-two acres, upon which 112 houses and two stores with apartments have been erected. In all, some 6,000 people are housed by the company.

In 1898, stockholders received 3 per cent in dividends; in 1899, 3½ per cent, and since that time 4 per cent annually. Interest and taxes on unimproved property have been deducted from earnings before dividends were paid, and no account has been taken of the increase in the value of the ground. The present investments of the company are a little over \$4,000,000.

Every apartment is a complete home in itself, with private toilet accommodations wholly within the dwelling. Every room has quiet, light, air, and an abundance of ventilation.

Walls and stairs are fireproof. The buildings are lighted and steam-heated. Each flat has steam-heat, hall, water-closet, hot water, two porcelain tubs, sink and drain board, dresser with shelves, closets and drawers, gas-range (no rent or deposit to be paid), meter, storage closet in basement. The four-room flats have private baths. Great economy to the tenant results from having steam-heat and hot water, and using gas-range for cooking and ironing.

This is perhaps the largest and most successful company of this nature in the U. S., but there are many more or less like it. (Mr. Henry Phipps, more recently has given \$1,000,000 for model houses in New York, the first building of which has

been erected at a cost of some \$225,000, and, following the example of the Paris *Maison des Enfants* (see below), has been especially adapted for children, with kindergarten in basement, room for perambulators, roof playground, hygienic laundries, etc. Among other model dwellings, some of the more important are: In Brooklyn, the Astral Apartments, owned by the Pratt Institute; in Boston, The Cooperative Building Company (1871); the Improved Dwellings Association (1885); the Rufus Ellis Memorial Building, the Harrison Avenue estate; in Philadelphia, the Theodore Shaw property. In Chicago, what has been accomplished has been done under the guidance of the City Homes Association of Chicago, which has committees for model tenements, sanitary aid, small parks, municipal lodging houses, etc.

Probably, however, the best work being done for housing in America is that of the Building and Loan Associations. (See that article.)

II. GREAT BRITAIN

(See also HOUSING IN GREAT BRITAIN, NEED OF, and MUNICIPAL HOUSING.) The first society to grapple with the housing problem was the Metropolitan Association for Improving the Dwellings of the Industrial Classes, founded in 1841, which now has fourteen estates of improved dwellings in London and pays 4½ per cent. The American, George Peabody (q. v.) in 1862 gave a large donation, later increased to £500,000, to provide dwellings and lodging-houses for the poor of London. The Peabody Trust to-day owns blocks of tenements, houses nearly 20,000 persons, and its capital is £1,500,000.

The Improved Industrial Dwellings Company of London, founded by Sir Sidney Waterlow, also dates from 1862, and endeavors to combine beauty and convenience in large blocks. The Guinness Trust, begun in 1889 by Sir E. C. Guinness (Lord Iveagh), has a group of buildings with 2,574 separate buildings for 9,736 persons. The average rent is 2s. 1½d. per room. The general plan of all these buildings is that of a central courtyard, around which the buildings are grouped with two- and three-room flats, every room opening on the outer air. There are some 600 such "model" tenements in all in London, tho all of them are by no means wholly model. They all pay, however. Of 161,000 persons living in London's model tenements less than 25 per cent live in tenements maintained by bequests. The Artizans', Laborers', and General Dwelling Company of London opens up suburban estates. The Marylebone Association improves the surroundings of working-class homes. The Rural Housing and Sanitation Association (1902) improves country working-class homes. The Working Men's National Housing Council carries on a campaign for municipal and local action. The National Housing Reform Council supplies information and conducts a general campaign. (See those societies.)

The Ealing Tenants' Cooperative Society, organized by a few Ealing workmen in 1901, has done an important work on a line of its own, and has been so successful that various similar societies have been started. It builds houses and makes the tenants shareholders, with eight representatives on its board out of eleven. Interest on shares cannot exceed 5 per cent., and loan stock 4½ per cent. Any surplus that may remain after meeting these charges is credited to the tenants, in-

sureing a rise in values, not to the land speculator, but to the rent-paying tenant. The rents fixed being 10 to 15 per cent. lower than is usually charged for such houses, the buildings, which have good gardens and are well built, are in great demand. (*Secretary*, Isabel Cooke, Woodfield Rd., Ealing.)

The Octavia Hill Association is another distinctive London movement. In 1864 Miss Octavia Hill (q. v.), under Frederick D. Maurice, aided by John Ruskin, who spent £3,000 in purchasing unsanitary property, began the movement by putting such property in repair, personally collecting the rent, and making this an entering wedge for friendly visiting, the encouragement of thrift by discounts for payment of rent in advance, and general help toward a higher standard of life. To-day Miss Hill and her assistants have the care of between 5,000 and 6,000 dwellings.

The movement has been copied in other cities, Philadelphia, New York, and Boston.

England's most characteristic efforts in the housing problem have been, however, in municipal dwellings (for which see special article), Lord Shaftesbury commencing legislation as early as 1851.

III. GERMANY

In Germany, as in Great Britain, the housing question is being largely worked out on municipal lines (see below), but private action came first. A mutual building company in Berlin dates from 1849. The present movement, however, is quite modern. In 1884, through the initiative of Pastor Bodelschwingh and as a part of the multitudinous activities of his colony (see BIELEFELD), a working-man's home association (*Verein Arbeiterheim*) was formed, which has erected some 120 houses in Bielefeld, and agitated the housing question over the empire. The Bielefeld houses are built mainly in pairs, usually four rooms below and five above, brick faced with stucco, and invariably have from a quarter to half an acre of land, for a garden, cow, pig, etc. The cost runs from \$1,400 up to \$35,000. The houses are either rented or sold; in the latter case, a deposit must be paid of \$60 to \$100 and 3½ per cent yearly of the purchase price as rent; also 2 per cent by way of redemption, and 5 per cent for a reserve fund, each house being made to pay for itself. When one third of the price has been paid, title is given, but the association has the right of preemption if the owner desires to sell. In the ordinary case it takes thirty years to pay for a house. The association, however, works largely to induce the State to take up the work and to favor the establishment of local cooperative building societies. It agitates also to show manufacturers the need of caring for the housing of their employees, to get the government to do so for government employees, and even to pass laws compelling new manufacturing companies to provide housing.

Partly as a result of this, much action has been undertaken. A policy has been developed whereby the city buys up suburban land to be resold or leased, at moderate prices, for building purposes, to prevent the rise of suburban prices through speculation. Berlin, Cologne, Munich, Dresden, Frankfort, Leipsic, have all done this, besides many smaller towns and cities. In Hesse thirty out of fifty-one communes have such lands. In 1902 the area of land held by 32

large towns varied from 10 to 365 square yards per head of population. Only 7 out of the 32 had less than 24 square yards per head; Berlin had 85. The plan has had great success. Leipzig, for example, in 1902 leased nearly 20 acres for 100 years to a philanthropic building society (*Gemeinnützige Baugesellschaft*) for the building of cheap homes. The municipality also constructs, at 4 per cent on the expenditure, roads, squares, etc., and advances money on mortgage for building purposes. The society itself is financed by the Insurance Board of the State of Saxony, which has advanced £300,000 at 4 per cent and 3 per cent for redemption. Insurance companies in Germany now practically invest their capital in public and philanthropic societies for houses and other benefits for the working classes. Up to 1904 \$20,383,000 had been invested in this way in working men's homes. The imperial government also aids. In 1901 a speech from the throne took up the question of housing, and various statistical reports have been made showing the need. In 1904 a German National Housing Council, attended by representatives of the empire, cities, etc., met at Frankfort. The result has been general action. In Prussia, \$10,500,000 of State money has now been spent in the erection of dwellings or financing building associations. The State of Hesse does the same. In Bavaria there exist 819 housing committees (*Wohnungs-Kommissionen*) in connection with the local governments.

The large surplus capital, too, of the various imperial industrial insurance funds (see INDUSTRIAL INSURANCE) is largely invested in this way. Up to 1904 nearly \$100,000,000 had been invested in this way, in the erection of working men's houses, baths, and hospitals, and sanitariums. The empire, too, for many years has done much to provide suitable dwellings for the employees of its various departments, railways, etc. Between 1901-3 advances of \$2,900,000 were made to thirty-eight building societies for this purpose. The empire also leases public land to be used in such ways. Various laws also favor such building societies with tax exemption, etc. Cooperative building aided by the State is thus the main German method, tho the municipalities are now beginning to put up municipal tenements. Düsseldorf has such tenements where two rooms are rented for 22 marks per month, and three for 30. At Frankfort-on-Main, the municipality guarantees 4 per cent interest to the International Building Society and is gradually buying out the company. Nuremberg is following the same policy. For details, see chapter vii. in W. H. Dawson's "The German Workman," to which we are indebted for much of the above information.

IV. FRANCE

In France a commission on working men's buildings was appointed as early as 1831, occasioned by a cholera scare, but little was done till 1889. A few building societies were formed like the *Société Mulhousiennes des Cités Ouvrières* (1851), the oldest French society of this nature still existing. In 1889, however, as a result of the social section of the Paris Exposition of that year, the important *Société Française des Habitations à Bon Marché* was formed, and as a result of its efforts, largely led by M. Siegfried, aided by donations from the Count de Chambrun and others, many societies of one kind or another,

for improved working men's dwellings, have been organized, very general attention has been called to the subject, and important legislation effected. Four societies were started that year, and in ten years some 55 more; 30 the direct result of the *Société Française*. Of these societies some are purely philanthropic like the *Société Philanthropique*, which has been active in this direction, as in others. It has three apartment-houses on the plan of the Peabody Trust in London. Most of the French societies, however, are partly philanthropic and partly commercial, like the similar English and American societies. Among these the largest is probably the *Société Anonyme des Logements Économiques* of Lyons, beginning in 1886 with a capital of 200,000 francs, and increased by 1897 to 5,000,000 fr. A few societies develop suburban working men's villages, like the *Société Anonyme des Habitations Ouvrières*, organized in 1888 by M.M. Chaysson and Cacheux, which has such a village at Passy Auteuil, a suburb of Paris. Not so large but of growing importance are the cooperative building societies like *La Pierre du Foyer* of Marseilles (1891). In 1904 there were reported in France no less than fifty-six cooperative building societies, many of them being aided by loans from savings-banks according to the Belgian plan (see BELGIUM), which has been adopted and adapted in France. Through the efforts of the *Société Française*, the government has created a Superior Council of Working Men's Homes and encouraged the departments and communal councils to do the same. French employers also interest themselves in the housing of their employees. Among the earliest to move in this direction was the *Compagnie des Cristalleries de Baccarat*. The *Compagnie des Mines d'Anzin* had 2,600 homes by 1889, and the *Compagnie des Mines de Blanzy* has 1,000 houses. (See also MODEL VILLAGES.) Most of the French railways also do more or less for the housing of their employees.

One characteristic French development is the *Paris Société des Logements pour Familles Nombreuses*, which has several blocks of flats rented only to families with many children. They are called *maisons des enfants*, and are especially adapted for children, with double stair balustrades, high for adults and low for children, with large balconies and sunny windows, and playground on roof. There are seventy-five apartments in each block, which rent for \$20 to \$80 per year, and are models of healthy flats.

V. BELGIUM

Concerning the important movement in Belgium and the great work of the Savings-Bank of Belgium in lending money to building societies, Mr. O. Velghe, secretary International Congress of Improved Dwellings, says as follows:

The point of departure of the remarkable movement in Belgium which has done so much for working men's dwellings was the law of Aug. 9, 1889, followed by various other laws, in which the government showed its solicitude for the welfare of the working classes.

1. By these laws there has been instituted in each administrative district a committee whose duty is to study, to report upon, to collect funds for, and take any measures favoring the development of cheap, healthy, and good homes for working men. These committees study the hygiene and conditions of the localities and of the houses and report, as occasion may require, to the local authorities, who have the power to compel improvements, or to forbid the occupancy of unhealthy houses and districts. Without legal power themselves, these committees do much to form public opinion. They have published important reports, and led to the for-

mation of numerous societies for erecting working men's dwellings.

2. The laws favor such societies, and exempt them from stamp and registration duties, by giving them free advertisements in the official journal, by reducing by one half the duties on sales, loans, and opening credit accounts, the charges of notaries, etc. In 1904 the reductions under this head alone amounted to 1,073,319 francs.

3. Working men buying or building homes, up to those paying registration duties of from 72 to 171 fr., are exempted from personal, provincial, and communal taxes.

4. The Savings-Bank of Belgium (see *BELGIUM*) is allowed to make loans to enable working men to buy or build homes, to insure the lives of those so doing, so as to preserve the home to the family, and to extend the rights of conjuncture in the ownership of homes.

In 1904 the number of working men's homes exempted by the law from payment of personal and other taxes was 104,387, or nearly one tenth of the total number of homes in Belgium, while the exemptions amounted to 1,740,000 fr., from the State, and nearly as much more from the provinces and communes.

Statistics

In 1904 the number of sales of real estate transacted under these laws was 6,456, and the loans and credits opened for obtaining homes was 4,936. The value of the real estate amounted to 10,836,440 fr. and the loans to 12,143,900 fr.

The numbers rise each year. In the fifteen years since the passage of the law of 1889 working men have acquired lands and houses valued at 98,000,000 fr., and have borrowed for purchase or construction 96,000,000 fr. There were in 1904 166 societies for building working men's dwellings, of which 161 had borrowed from the Savings-Bank, at from 2½ to 3½ per cent; 30,000 working men had become or were in way of becoming owners of property, representing a population of 150,000, while no less than 70,000 had profited by the legislation, in exemption of duties, in loans from the Savings-Bank, or in other ways, representing a population of 350,000, or about one twentieth of the whole population. Such statistics show the extent, the importance, and the success of the movement.

The dark side consists in the fact that the very poor, tho needing homes the most, being wholly without means, have been unable to avail themselves of the legislation. It is hoped, however, that a way will be found out of these difficulties.

VI. OTHER COUNTRIES

Other countries, outside of New Zealand perhaps (see *NEW ZEALAND*), have less to contribute to the housing question. Italy is taking up the question, but the main efforts are in connection with the Umanitaria Society of Milan (see *UMANITARIA*). Austria and Switzerland are following slowly in German channels. An important International Housing Society (*Congrès International des Habitations à Bon Marché*; secretary, M. O. Veighe, Ministère de l'Agriculture, Brussels, Belgium) has been formed which has held several congresses—in 1907, in London.

HOWARD ASSOCIATION, THE: Founded 1866 under the patronage of Lord Brougham. Object: To promote the best methods of treatment and prevention of crime. The principles of John Howard have been generally embodied in the work of the association.

It advocates:

- (1) The disuse of degrading punishments, such as "shot-drill," the treadmill, and the crank.
- (2) The disuse of prolonged cellular isolation, and insistence on the necessity of providing interesting and remunerative work for prisoners.
- (3) Preventive efforts in the treatment of minor offenders.
- (4) The right of poor prisoners to pay by instalments fines imposed for petty misdemeanors.
- (5) The promotion of adult reformatories.

It collects information both at home and abroad bearing on present systems of punishment and prevention of crime. Many books and pamphlets dealing with prison management, pauperism, boarding out neglected children, vagrancy, and kindred subjects have been published. *Secretary:* Thomas Holmes, The Howard Association, Devonshire Chambers, Bishopsgate Without, London, E. C.

HOWARD, GEORGE ELLIOTT: Educator; historian; born at Saratoga, N. Y., 1849; A.B. and Ph.D. of the University of Nebraska; studied institutional history and Roman law at Munich and Paris, 1876-78. He became professor of history, University of Nebraska, 1879-91, and the head of the historical department of Leland Stanford University, 1891-1901. In 1902 he lectured on history at Cornell University (summer) and was professorial lecturer in history at the University of Chicago, 1903-4. He returned to the University of Nebraska in 1904 as professor of institutional history, and in 1906 became professor of political science and sociology in that institution. Professor Howard has published many papers and articles in magazines and scientific journals on political, social, and historical subjects. Mr. Howard is an independent in state and federal politics; favors municipal ownership and home rule; and advocates strict government control of business monopolies and trusts. He is author of "Local Constitutional History of the United States"; "Development of the King's Peace"; "History of Matrimonial Institutions Chiefly in England and the United States"; "Marriage and Divorce," in "Encyclopedia Americana," "Preliminaries of the Revolution," and "Social Control and the Function of the Family," in vol. vii., "Congress of Arts and Sciences." Address: 1910 E Street, Lincoln, Neb.

HOWARD, JOHN: Prison reformer; born at Enfield, England, in 1726. His father, a wealthy London merchant, apprenticed him to a grocer, but in 1742 he bought up his indenture. Until 1773 he lived a comparatively secluded life, distinguishing himself only in charity. He was made the high sheriff of Bedford in 1773, and the characteristic work of his life then began. Visiting the jails, he found them wretchedly defective; but what chiefly shocked him was that neither the jailer nor his subordinates were salaried officers, but were dependent for their livelihood on fees which they rigorously exacted from the prisoners themselves. Some whom the juries had declared not guilty, others in whom the grand jury had not found even such appearance of guilt as would warrant a trial, others whose prosecutors had failed to appear, were frequently detained in prison for months after they had ceased to be in the position of accused parties, until they should have paid the fees of jail delivery. His prompt application to the justices of the county for a salary to the jailer in lieu of his fees was met by a demand for a precedent for charging the county with such an expense; and he went accordingly from county to county until his journey had extended to every town in England which contained a prison, but the object of his search eluded inquiry. But he did find so many abuses in prison management that he determined to devote himself to the reform of those abuses. The task cost him a fortune and the best remaining years of his life.

He reported his discoveries to the House of Commons, and at once an act was passed which provided, among other reforms, for the liberation, free of all charges, of every prisoner against whom the grand jury failed to find a true bill, giving the jailer a sum from the county rate in lieu of the abolished fees.

He then devoted himself for eight or nine years to an investigation of the prisons of Europe, overcoming many difficulties and braving many dangers. The publication of his large accumulation of facts had a direct and immediate influence upon prison legislation. The last five years of his life were chiefly devoted to researches as to the means which ought to be used in the prevention of the plague and all contagious diseases. In pursuit of knowledge on this subject he again traveled through Europe and Asia Minor, visiting hospitals, lazarettos, and pest-houses of all kinds, and published the results of his researches in 1789. Attempting to make yet another European tour, he took a fever from a patient and died in Cherson in 1790. He was of a deeply religious temperament. "He died a martyr after living an apostle." (See PENOLOGY.)

HOWE, SAMUEL GRIDLEY: Reformer and philanthropist; born at Boston, 1801. Graduated at Brown and Harvard Medical School, 1824. Offering his services in the cause of Greek independence, he served in the Greek army till 1830. Visiting Paris he aided in the July Revolution. In 1832, returning to Boston, he devoted his life to the education of the blind. He mainly created the Perkins Institution for the Blind, which became the greatest institution of the kind in the world. One of his most remarkable achievements was the education of Laura Bridgeman. In 1845 he became interested in the abolition movement and founded and edited an antislavery paper in which his wife, Julia Ward Howe, aided him. During the war he was a director of the Sanitary Commission, and then worked for the Freedmen's Bureau. In 1863 he originated the State Board of Charities of Massachusetts, the first of the sort in America. In 1866 he was sent to carry relief to the Cretan refugees in Greece. He died 1876. See Sanborn's "Dr. S. G. Howe, the Philanthropist."

HOWELLS, WILLIAM DEAN: Author; born at Martinsville, O., in 1837. His father was a printer, and of him he learned the printer's trade. He became editor of the *Cincinnati Gazette* and the *Ohio State Journal*. He was United States Consul at Venice 1861-65, and in 1871 became editor of the *Atlantic Monthly*, retaining this position till 1880. Since then he has produced a long list of writings. He conducted for several years "The Editor's Study" and afterward "Editor's Easy Chair" in *Harper's Magazine*. He has interested himself very largely in social reform, and especially in his "A Traveler from Altruria." Address: 48 West Fifty-ninth Street, New York.

HUBBARD, ELBERT: Proprietor of the Roycroft shop devoted to artistic books, East Aurora, N. Y.; editor of *The Philistine*; born in Bloomington, Ill., 1859, and educated in the common schools. Mr. Hubbard has been a prolific writer of short books (tales or monographs), among the best known being a series of "Little Journeys to the Homes of Great Men," authors, artists, statesmen, philosophers, etc.; "A Message to Garcia."

His small but keen monthly, *The Philistine*, has a very wide reading, and Mr. Hubbard has traveled, lecturing in all portions of the United States. The Roycroft Press, at East Aurora, N. Y., incorporated 1892, is devoted to the production of de luxe editions of the classics, and the effort of the establishment toward its workers is to make the man count and not the machine. Stock in the company is sold only to officers, superintendents, or employees (\$25 a share) and 12 per cent annually is guaranteed. In good years funds are distributed to employees whether stockholders or not. In 1903 about one half the stock was held by employees. Any employee leaving the service must sell his stock to Mr. Hubbard at the price paid. Mr. Hubbard's views are those of an individualist free lance, though favorable to many co-operative and even some socialistic measures. Address: East Aurora, N. Y.

HUBER, VICTOR AIMÉ: The founder of German Christian Socialism; born in Stuttgart in 1800. He took a degree in medicine in 1820 at the University of Göttingen, but obtained a State stipendium. Throwing himself into the social and political movement of the times, he visited Paris, Lisbon, Hamburg, Edinburgh, Italy, and at last settled down in Bremen as one of the masters of the Merchants' School of that town.

In 1832 he procured a post at the University of Rostock, and at Marburg six years later. In 1839 he was elected to the Hessian House of Representatives as an ultra-Conservative statesman. Friedrich Wilhelm IV., of Prussia, now induced him to come to Berlin and to found a Conservative periodical under royal patronage. As editor of this periodical, the *Janus*, Huber made it the vehicle for pressing his pet scheme of cooperation.

After the March revolution in 1848 this publication, which in many respects resembled the *Christian Socialist* of England and *L'Avenir* of France, was discontinued, and another method for rallying the friends of social reform on Conservative principles was made by Huber in forming his Association of Christian Order and Liberty. But this, too, proved unsuccessful. Huber found more favor, in truth, among the Social Radicals than in his own reactionary circles. Huber also interested himself in the *Gesellenwater Kolping* and Bishop Ketteler (q.v.). But failing to interest the aristocratic classes of Berlin, he found a new home in the little town of Wenigerode, among the Hartz Mountains, and left only to pay visits to France, Belgium, and England, and thus became a living organ, so to speak, for international communication on the subject of cooperative association. He lived in daily companionship with laborers and artisans in order to raise them by personal contact to a higher level. In this he spared no sacrifice of time or money. He founded a loan society, an institution for smaller tradespeople, and a technical school for the instruction of young apprentices after leaving the ordinary schools, where he taught himself. He also called into existence a Christian Association of Journey-men. He died 1869.

HUDSON, WALTER: English Labor member of Parliament; born 1852, Richmond Station, Yorkshire. His youth was spent in various occupations on the North-Eastern Railway, until appointed main line guard, which position he held for twenty-six years. He was always interested in trade-union work, and in 1891, at the annual

congress of the Amalgamated Society of Railway Servants, was elected president, and was reelected seven times. In 1903 appointed president of the Irish Trades Congresses. Elected to Parliament, 1906, for Newcastle-on-Tyne. Address: 22 Atherfold Road, Clapham, London, S. W.

HUET, FRANÇOIS: Born at Villeau, in Belgium, 1814. At the age of twenty-two he was appointed Professor of Philosophy at the University of Ghent, a post which he retained up to 1850. About 1846, his philosophical studies led Huet to approach social questions, and he collected around him a group of pupils to study social reform. . . . Huet also published, in 1864, "La Science de l'Esprit." He presided over the education of Prince Milan, now King of Serbia, and even followed him to Belgrade. Having returned to Paris to undergo treatment for a severe disease, he died (1869). M. de Laveleye, his most distinguished pupil, says of him:

For the basis of his system he takes the principles of 1789, and endeavors to realize in everything the motto, "Liberty, Equality, Fraternity." His ideas on this point were, without his knowing it, similar to those of Fichte. . . . The following is a summary of them: Men are by right equal. They have the right to an opportunity to develop themselves. This means a right to property, which should be realized in the "right to patrimony," by virtue of which every person in a position to labor would obtain a share in the general wealth. "Every year a division should be made of the patrimonial property left ownerless through death. All the young people of either sex, who during this year reach the age of either fourteen or twenty-five years, should obtain a share of each person of full age being double the share of each minor." The right of hereditary succession is abolished, but gifts by will or *inter vivos* are authorized. Each person, however, can dispose only of property acquired by his own labor, and not of that received by way of gift or legacy. This goes to increase the common patrimony.

Leveling Socialism as Huet is when he claims for all an equal right of accession to property, he is a thorough individualist on the question of the organization of labor. He rejects all State intervention; he does not like even corporations holding industrial capital. The individual, put in possession of "his patrimony," may work by himself, or in partnership with others, provided he do so freely, without any privileges or close corporations.

M. Huet also published a charming book entitled "Le Règne Social du Christianisme," containing a complete social theory based on Christianity, which Laveleye says has not met the attention it deserves only because it is too full of Christianity for the Socialists, and too full of socialism for Christians.

HUGHES, THOMAS: Born near Newbury, Berkshire, England, 1823. He was educated at Rugby, under Dr. Arnold, and at Oriel College, Oxford, where he was graduated in 1845. He was called to the bar at Lincoln's Inn in 1848. He was prominent in the Christian Socialist movement of Maurice and Kingsley in 1849-50. (See **CHRISTIAN SOCIALISM**.) He published his immortal "Tom Brown's School-days" (1857); "Tom Brown at Oxford" (1861); "The Manliness of Christ" (1879), besides many lesser writings. From 1865-74 he sat in Parliament. In 1869 he became Queen's Counsel, and in 1882 a county court judge. In 1870 he visited the United States. Becoming interested in this country, "New Rugby" colony was conceived. Fifty thousand acres were bought and 300 men were actually on the grounds, mainly sons of English farmers, but Judge Hughes was no financier, and it honorably failed. He died 1896.

HULL HOUSE (CHICAGO): Hull House, one of the first American settlements, was established in

Sept., 1889. It represented no association, but was opened by two women, backed by many friends, in the belief that the mere foothold of a house, easily accessible, ample in space, hospitable and tolerant in spirit, situated in the midst of the large foreign colonies which so easily isolate themselves in American cities, would be in itself a serviceable thing for Chicago. Hull House endeavors to make social intercourse express the growing sense of the economic unity of society, and may be described as an effort to add the social function to democracy.

The earliest activities of the settlement were the ordinary ones of children's clubs, kindergartens, receptions, and evening classes. From these larger activities developed which may be described under general headings.

The College Extension courses were established at Hull House before the University Extension movement began in Chicago, and are not connected with it, altho University Extension courses are constantly given at Hull House and every Sunday evening for many years the Extension Department of the University of Chicago has donated a stereopticon lecture. These are attended by large audiences of men. A helpful supplement of the College Extension courses has been the Summer School, which was held for ten years in the building of Rockford College, at Rockford, Ill. The sum of \$3 a week paid by each student for board covers the entire expenses of the school; the use of the buildings, including gymnasium and laboratories, given free of rent.

Hull House hopes to develop a technic of teaching especially adapted to adults while utilizing the usual school and college type. Our experience with large classes of immigrants who wish to learn English has resulted in the collection of a special line of text-books and series of pictures.

Organizations which are on the border-land between classes and debating clubs have arranged for a number of public lectures, such as the "Working People's Social Science Club," which was the first body including men to be organized at Hull House. This club was formed through the activity of an English workingman, during the first year of Hull House, for the discussion of social problems, and continued to meet weekly for seven years. The discussion was always animated, and every conceivable shade of social and economic opinion was represented, but radicals are so accustomed to hot discussion and sharp differences of opinion, that an almost incorrigible good nature prevailed.

Closely connected with such discussions of economic subjects has been the formal connection between Hull House and organized labor, altho such connection may be fairly said to rest upon the foundation of personal relations with the organizers of various women's unions, who have lived in the house as guests or residents. Several unions hold their regular meetings at the house, and the Chicago branches of two well-known federal organizations of working women have been formed there: The Women's Union Label League and the Women's Trade-Union League.

Several of the Hull House educational enterprises have developed through the effort made to

Trade-
Unions

bridge the past life in Europe with American experiences in such wise as to give them both some meaning and sense of relation. The Hull House Labor-Museum was in the first instance suggested by many people in the neighborhood who had come directly from country places in southeastern Europe in which industrial processes are still carried on by the most primitive methods. It was not unusual to find an old Italian woman with her distaff against her homelick face patiently spinning a thread by the simple stick spindle which had certainly been used in the days when David tended his sheep at Bethlehem. In the immediate neighborhood were found at least four varieties of these most primitive methods of spinning and at least three distinct variations of the same spindle put in connection with wheels. It was possible to put these seven into historic sequence and order, and to connect the whole with the present method of factory spinning. The same thing was done for weaving, and on every Saturday evening a little exhibit is made of these "various forms of labor" in the textile industry. Within one room the Syrian, the Greek, the Italian, the Slav, the German, and the Celt enable even the most casual observer to see that there is no break in orderly evolution, if we look at history from the industrial standpoint. The interest on the part of the classes in dress-making, millinery, cooking, and sewing in this historic background has been most gratifying.

Closely identified with the Labor-Museum and the classes in pottery, metal work, enamel, and wood-carving, The Chicago Arts and Crafts Society was organized at Hull House and several members of this society live in the buildings on the Hull House quadrangle. The artists find something of the same spirit in the contiguous Italian colony that the French artist is traditionally supposed to discover in his beloved Latin Quarter. Successful classes in drawing, modeling, painting, and lithography are continued year after year, and the space given to the studios has been constantly enlarged. Miss Starr's bookbindery is in the same building with the other shops and is opened to those especially interested in choice books or in the processes of making them. Occasional art exhibits have always been held at Hull House and the response to excellence in matters of art has always been gratifying.

The Hull House Music-School was started in the fourth year of Hull House, altho Miss Eleanor Smith and Miss Hannig, who are its heads, had almost from the beginning held weekly classes there. The Music-School is designed to give a thorough musical instruction to a limited number of children. From the beginning they are taught to compose and to reduce to order the musical suggestion which may come to them. They sometimes find folk-songs in the possession of their old country relatives which have survived through the centuries.

Two years ago a beautiful memorial organ was erected at Hull House, which has greatly added to the resources of the Music School and to the interest of the public concerts which have been given every Sunday afternoon for fifteen years. Another method of education which has been gradually used more and more at Hull House is

that made possible through dramatics, largely amateur, altho professionals have from time to time been most generous with their services. The first dramas at Hull House were produced in the gymnasium until they seemed to justify the erection of a well-equipped stage in a room erected for a theater.

In the immediate vicinity of Hull House is a large colony of Greeks, who often feel that their history and classic background are completely ignored by the Americans in Chicago, and they therefore welcome an opportunity to present Greek plays in the ancient text. Two of these plays have been remarkably successful; they were carefully staged by Miss Barrows, and the "Ajax" of Sophocles was a genuine triumph to the Greek colony. The little Hull House stage has presented many Italian plays and a few in other tongues, but, of course, the Hull House Dramatic Association present their productions in English and have gradually built up a little clientele of admirers from all parts of the town, and the members have developed in the course of years some genuine dramatic ability. This association gives two carefully prepared dramas each winter. They have presented Ibsen and Shaw as well as melodramas and classic plays. There are also Junior Dramatic Associations.

Gymnasium instruction, with the help of limited apparatus, was provided from the first years of Hull House, but not until 1893 was a separate gymnasium building erected, supplied with a complete system of shower-baths and a running-track.

The Jane Club, a cooperative boarding-club for young working women, had the advice and assistance of Hull House in its establishment. The original members of the club, seven in number, were a group of girls accustomed to cooperative action. The club has been from the beginning self-governing, the officers being elected by the members from their own number, and serving six months gratuitously. The two offices of treasurer and steward have required a generous sacrifice of their limited leisure time as well as a good deal of ability from those holding them. The weekly dues of \$3, with an occasional small assessment, have met all current expenses of rent, service, food, and heat. There are various circles within the club for social and intellectual purposes. The atmosphere of the house is one of comradeship rather than of thrift. The Jane Club seven years ago moved into a house built expressly for its use. It provides bedroom space for thirty members, twenty-four of them single rooms, with a library and a living-room, and a dining-room large enough to use for social gatherings.

The Culver Club is a residential club of thirty working boys who occupy two upper floors of the Hull House Boys' Club Building. They are self-sustaining and most generous in their services to the social life of the Boys' Club house.

The Hull House Men's Club was organized in 1893, and incorporated under the state law. They rent from Hull House a building for their exclusive use, which is open to members every day and evening. The club holds a monthly reception during the winter and arranges for occasional public debates. The purpose of the club is educational as well as recreative.

Concerts

The Hull House Woman's Club is housed in a building of its own. It has exclusive control of the library and sewing-room, but the large hall, which seats 800 people, is used for many other purposes. The membership is 600. The "Year Book," which is issued in advance each September, shows a full program of lectures on current topics by distinguished speakers, discussions by club members, and musical afternoons by the club's own chorus. The club sustains a visiting-nurse, who lives at Hull House. The club contributes regularly to the Juvenile Court and to the vacation schools and other public undertakings.

At present thirty-five social organizations meet weekly at Hull House, composed of young people who elect their own officers and prepare their own programs under the approval of their "directors."

Social Clubs

Some of these clubs are purely social, others do serious educational work. Dancing-classes, which are always well attended, have been established in connection with the social clubs.

The Hull House Boys' Club of 1,500 members occupies its own building, equipped with bowling-alleys, billiard-tables, athletic apparatus, shops for work in iron, wood, and printing, library and class-rooms. The house is open to members every day from three to ten P.M., and its preservation and good order are carefully guarded by the club members themselves.

Boys' Club

Every afternoon after school hours all the available rooms at Hull House are filled with children's clubs, which are designed to be social and recreative in character, altho some serious study is done by groups in sloyd, in sewing, in clay modeling, in cooking, and in gymnastics. The membership of the various clubs and classes consists of 1,500 school children. Summer outings are arranged for them as well as Christmas entertainments and moving-picture shows.

Afternoon Clubs

The Coffee-House was opened in 1893 on the basis of a public kitchen. An investigation of the sweat-shops of the neighborhood had disclosed the fact that sewing-women during the busy season paid little attention to the feeding of their families, for it was only by working steadily through the long day that the scanty pay of five, seven, or nine cents for finishing a dozen pairs of trousers could be made into a day's wage; and that the women, therefore, bought from the nearest grocery the canned goods that could be most quickly heated or gave a few pennies to the children with which they might secure a lunch from a neighboring candy-shop.

Coffee-House

One of the residents made an investigation, at the instance of the U. S. Department of Agriculture, into the food values of the dietaries of the various immigrants, and this was followed by an investigation made by another resident, Miss Hunt, for the U. S. Department of Labor, into the foods of the Italian colony, disclosing the fact that the constant use of imported products bore a distinct relation to the cost of living. The result of these various studies led to the opening of a public kitchen modeled after the New England Kitchen of Boston. The sale of cooked foods, however, has never been popular, altho the restaurant aspect of the Coffee-House developed rapidly. This performs a mission of its

own and has become something of a social center to the neighborhood. Business men from the adjacent factories, and school teachers from the nearest public schools, use it constantly. Every evening students and club members sup together in little groups or hold their reunions and social banquets, as do organizations from all parts of the town to a certain extent. The Coffee-House has been self-sustaining from the beginning, and of later years has been able to pay an adequate rental to Hull House.

A Day Nursery was opened because of the many mothers who were obliged to work and who quite simply asked the kindergartner to "keep the baby for the day." A small apartment was taken across the street and turned into a day-nursery, which was later moved into a cottage on the

Day Nursery

nearest side street, and altho a second kindergartner was started here, the earlier one in the drawing-room continued. Later a building called the Children's House was erected for the purpose of housing all of the activities of the children with special reference to the Day-Nursery and Kindergarten. The former averages thirty children a day, and because it is inadequate to the needs of the neighborhood, still another building is in process of erection in which a day-nursery will be maintained by the Chicago Relief and Aid Society. Facilities are also provided in this building for teaching the immigrant mothers the beginnings of wage-earning occupations.

From the beginning a constant effort was made to hand over to public authority every activity that had been initiated. Shower-baths had been

Public Utilities

maintained in the basement of the house for the use of the neighborhood and they afforded some experience and argument for the erection of the first public bath-house in Chicago, which was built on a neighboring street and opened under the care of the Board of Health. The reading-room and Public Library Station which was begun in the house is continued but a block away. The lending collection of pictures has been incorporated into the Public School Art Society of Chicago, of which Miss Starr was the first president.

Hull House has always held its activities lightly, as it were, in the hollow of its hand, ready to give them over to whomsoever would carry them on properly, for there is among the residents a distrust of the institutional and a desire to be free for experiment and the initiation of new enterprises.

It was, perhaps, significant that the only political office ever sought was that of garbage inspector for the Hull House ward. The poor collection of refuse throughout the city made the greatest menace in the Nineteenth Ward, where the normal amount was much increased by the decayed fruit and vegetables discarded by the Italian and Greek fruit-sellers, and it seemed quite probable that this condition had some connection with the high death-rate so persistent in the ward. One of the residents held this office of inspector for three years, and while many of the foreign-born women of the ward were much shocked by this abrupt departure into the ways of men, they were finally convinced that if it were a womanly task to go about in tenement-houses in order to nurse the sick, it might be quite as womanly to go through the same district in order to prevent the

breeding of so-called "filth diseases." Moreover, the spectacle of eight hours' work for eight hours' pay, the even-handed justice to all citizens irrespective of "pull," the dividing of responsibility between landlord and tenant, and the readiness to enforce obedience to law from both, was, perhaps, one of the most valuable demonstrations that could have been made. Investigations have also been made into the causes of truancy and juvenile delinquency in their relation to housing. The moral energy of the community is aroused only when people realize that they may become part of the general movements which make for the reform and healing. In illustration of this theory the neighborhood cooperated most generously in a careful investigation of the sweat-shops of the neighborhood which was made in 1892 by Mrs. Florence Kelley, one of the early residents, appointed to do the work by the Illinois Labor Bureau. The report brought a special commission from the legislature to look into the matter, and the recommendations of this committee resulted in the passage of the first factory law for Illinois, which dealt largely with the sanitary conditions of the sweat-shops and the regulation of the age at which a child might be permitted to work, and Mrs. Kelley was appointed the first factory inspector with a deputy and a force of twelve inspectors.

So far as Hull House residents have been identified with public offices, it has been in the attempt both to interpret the needs of the neighborhood to public bodies and to identify the neighborhood energies with civic efforts. This has been true of Miss Lathrop's long experience as a member of the State Board of Charities, with the work of another resident officer as a member of the Chicago School Board, and with the work of four different residents in their official connection with the Juvenile Court of Cook County.

No university or college qualification has ever been made in regard to residents, altho the majority have always been college people.

Residents

The organization of the settlement has always been extremely informal.

Residents are received for six weeks, during which time they have all privileges, save a vote at residents' meeting. At the end of that period, if they have proved valuable to the work of the house, they are invited to remain. The expenses of the residents are defrayed by themselves on the plan of a cooperative club, under the direction of a house committee. An apartment-house, which shelters twelve families, gives a chance of growth in the residential force, and also provides more convenient quarters for old friends and neighbors of the house who are glad to occupy them. The residential force numbers thirty-four, equally divided in number as to men and women, altho others are most constant in their service. The people from other parts of town who contribute single days or evenings number approximately 100 a week.

It is estimated that 7,000 people come to Hull House each week, either as members of clubs or organizations, or as parts of an audience. The total attendance of the various clubs and classes varies from year to year, only as we are able to provide more room, and it sometimes seems as if nothing but available space could limit it. The residents, however, are convinced that growth either in buildings or numbers counts for little unless the settlement is able to

evoke valuable resources of moral energy and social ability from the neighborhood itself.

JANE ADDAMS.

HUMANITARIAN LEAGUE, THE: Founded 1891; object, to advocate humane principles from rational and consistent principles.

The main principle laid down in its manifesto is that "it is iniquitous to inflict suffering on any sentient being except when self-defense or absolute necessity can be justly pleaded."

Among the reforms advocated by the Humanitarian League are:

A thorough revision and more humane administration of the English criminal law and prison system, with a view to the institution of a court of criminal appeal, the discontinuance of the death penalty and corporal punishment, and an acceptance of the principle of reclamation instead of revenge in the treatment of offenders.

The establishment of public hospitals under municipal control, where experimentation on patients shall be impossible. The complete abandonment of the medical tyranny which would enforce vaccination by fines or imprisonment.

The extension of the principle of international arbitration, and the gradual reduction of armaments.

A more considerate treatment of subject races in British colonies.

A more vigorous application of the existing laws for the prevention of cruelty to animals, and an extension of these laws for the protection of wild animals as well as domestic.

Prohibition of the torture of animals by vivisection in the allied interests of science.

Insistence on the immorality of all so-called "sports" which seek amusement in the death or suffering of animals. Legislative action in the case of the most degraded of such sports.

The prevention, by the encouragement of a humaner diet, of the sufferings to which animals are subjected in cattle-ships and slaughter-houses; and, as an initial measure, the substitution of well-inspected public abattoirs for the present system of private butchery.

An exposure of the many cruelties inflicted, at the dictates of fashion, in the fur and feather trade.

Recognition of the urgent need of humaner education, to impress on the young the duty of thoughtfulness and fellow-feeling for all sentient beings.

The leading spirit in the league is its *Secretary*, Henry S. Salt, 53 Chancery Lane, London, W. C.

HUNGARY: The following article is concerned with matters affecting Hungary alone. (See article AUSTRIA-HUNGARY for affairs concerning the dual monarchy.)

I. Statistics

Hungary is a constitutional kingdom with a total area of 125,430 sq. m., and a population of 19,254,559 in 1900, inclusive of those in active military service. Of these totals 100,007 sq. m. with 16,838,255 population belong to Hungary and Transylvania, and 16,423 sq. m. with 2,416,304 people to Croatia and Slavonia. There were in all 9,582,153 males and 9,672,407 females. The population per square mile is 154 in Hungary and 147 in Croatia-Slavonia. The most important cities with population in 1900 are: Budapest, 732,322; Szegedin, 102,991; Szabadka, 82,122; Debreczen, 75,000; Pressburg or Pozsony, 65,867; Zagráb (Agram), 61,000; Arád, 56,260; Klausenburg or Kolosvár, 49,295. The population of the kingdom is by no means homogeneous. The Hungarian or Magyar stock numbered in 1900 about 8,742,300; the Germans, 2,135,181; the Slovaks, 2,019,641; the Rumanians, 2,799,479; the Croatsians, 1,678,569; the Servians, 1,052,180; the Ruthenians, 429,447; others, 397,761—of whom about 200,000 are gipsies.

In 1905 there were 734,335 births—13,803 of which were still-born and 69,211 illegitimate; 574,795 deaths, including the still-born; surplus of births over deaths, 159,611; marriages, 170,560. The proportion of still-born is 1.88 per cent; that of illegitimacy, 9.4. The annual increase from 1895-1900 was 0.98 per cent. Hungary lost by emigration to the U. S. 170,430 in 1905, a tremendous increase over 1900 with 54,767.

Religious affiliation is predominantly Roman Catholic, 9,919,913 in 1900; Greek Oriental, 2,815,713; Greek Catholics or Uniates, 1,854,143; Reformed (Calvinistic), 2,441,141; Evangelical Lutheran, 1,288,942; Unitarians, 68,568; Jews, 851,378; others, 14,760.

Education is progressing. In 1880 only 5,398,190 could read and write, and 9,483,930 could not; in 1900, some 9,483,930 could read and write, tho there were still 9,131,276 who

Vital Statistics

Total Attendance

could not. School attendance is compulsory from six to twelve. There were (1903) 2,768 infant schools; 18,783 primary schools with 2,609,419 pupils; 92 training schools; and 151 "humanistic" schools; 174 gymnasias; 43 real schools; 3 universities; 49 theological colleges; 10 law schools; 552 industrial schools (478 for apprentices), 63 agricultural schools, 155 commercial, besides various others.

Occupations are chiefly agricultural. In 1900 in Hungary, including Croatia and Slavonia, 6,055,390, or 68.4 per cent of the population, as against 72.5 per cent in 1890, were engaged in agriculture, 1,197,130 in industry, 225,838 in commerce, 385,334 in domestic service, 213,910 in the professions and public service. The clothing industry employs some 281,000;

Industrial Statistics

foods and drinks, 120,000; building trades, 125,000; wood-working, 100,000; iron and steel, 128,000; textiles, 80,000.

Industries are improving. The unproductive area amounts to only 1,540,351 hectares, or 4.76 per cent of the total; 13,394,705, or 41.43 per cent are arable; 7,564,185, or 23.4 meadows and pastures; 8,987,243, or 27.8, woodland; 430,934, or 1.33, gardens; 331,751, or 1.03, vineyards. The land is fairly well divided, 2,771,118 small proprietors owning about 55 per cent of the area in holdings of 1 to 150 acres. About 87 per cent of the peasantry own land. The large estates comprise about 45 per cent of the area, divided among 24,774 owners. The principal crops are wheat, 46,427,000 metric centers in 1905; barley, 14,221,000; rye, 13,483,000; oats, 12,205,000; maize, 28,559,000; potatoes, 49,210,000; beet-root for fodder, 40,431,000; beet-root for sugar, 19,310,000; 3,837,000 hectoliters of wine. Timber was exported to the value of 84,931,000 kronen.

Mining gave employment to 71,570 persons, mostly men, and produced an output valued at over 107,000,000 kr., chiefly pig iron, lignite, gold, and coal.

Commerce is growing. Exports (1904) 1,355,544,000 kr.; imports, 1,328,881,000; (1905) 1,398,392,000 and 1,363,674,000. The chief exports are flour (corn), oxen, wheat, swine, barley. The chief imports, cotton and woolen goods, coal. The exports were in millions of crowns (1903), to Germany, 155, and to Great Britain, 61. The imports from Germany were 72 millions and from Great Britain, 19. Serbia, France, Switzerland, Italy, and Rumania have also considerable trade with Hungary.

Shipping and navigation are not important. There are in the mercantile marine 477 vessels with a tonnage of 92,484, and 2,460 crews. Fiume is the only seaport of Hungary. The river traffic, however, is considerable. The various steamers carried in 1905 nearly 2,000,000 passengers and nearly 4,100,000 tons of freight.

II. Constitution and Government

Altho the junior and smaller partner of the dual monarchy, Hungary has constantly grown in importance, and has given much trouble to the senior partner. This has been the case especially during the last three years. The Magyars are endeavoring to have a Hungarian army, with the Magyar as the official language, and Hungarian commanders. These demands having been granted to a certain extent, other matters came up, aiming apparently at a complete separation between Austria and Hungary. This is, at least, the implied aim of the opposition party in the Parliament.

Hungary is a strictly constitutional monarchy. When Emperor Francis Joseph of Austria was crowned as King of Hungary in 1867, he had to swear allegiance to the constitution, dating in its beginnings from the *Bulla Aurea* of King Andrew II. in 1222. It has been suspended and amended repeatedly, but now provides for a separate Hungarian Parliament. It has two houses: the House of Magnates and the Lower House, or House of Representatives. In the former are 16 archdukes, 241 hereditary heirs, 42 archbishops, bishops, and other dignitaries of the Roman Catholic and Greek churches, 13 representatives of the Protestant churches, 19 dignitaries ex officio, and 3 delegates of Croatia and Slavonia. The Lower House has 453 members: 413 from Hungarian towns, elected by male vote, of twenty years or upward, who pay a small tax, or have a small income; 49 delegates are from Croatia and Slavonia.

There is a cabinet of nine ministers, presided over by the President of the Council, or Prime Minister.

The main parties are Liberals, Independents, and the Nationalists. The Croats usually vote with the Liberals. In 1905 the Liberals, who had been in power the most of the time since 1867, were defeated with their leader, Count Tisza. Count Andrássy and M. Kossuth were

Parties

invited to form a coalition cabinet, but could not agree with the king, and Baron Fejervary formed a ministry. M. Kristoffy, Minister of the Interior, brought forward a proposal of universal manhood suffrage, which was adopted by his colleagues and eagerly supported by the Socialists and non-Magyar races of Hungary, to the embarrassment of the coalition.

A long struggle developed. Parliament was prorogued and on assembly prorogued again, it protesting against the illegality of this. Various ministries were formed and dissolved till finally the crown accepted the proposals of the Independents of the Constitutional Party, on a program of universal suffrage, the progressive nationalization of the Hungarian army, and the increasing use in the army of the Magyar language, thus appealing in a measure from the Liberal and the coalition parliamentary leaders to the interests of the people, and a new ministry was formed, April 8, 1906, with Dr. Wekerle as Premier, Count Julius Andrássy, Count Apponyi, and M. Kossuth all taking office with him. The Liberal Party decided to dissolve itself, and Count Tisza retired into private life. The elections resulted in an overwhelming majority for the new government, at least 250 of the deputies returned being Independents.

The *finances* of the country are in a satisfactory condition. The total revenue in 1905 was 1,057,850,000 kronen; the expenditure, including extraordinary demands, 1,192,209,000; in 1904 the figures stood: 1,283,851,000 and 1,215,358,000. The State debt amounted to 5,432,230,000 kr., or about \$1,098,000,000, in 1904. (See also AUSTRIA.)

The *railways* of Hungary had a total length of 18,130 kilometers in 1905—7,774 owned by the State; 7,384 owned by companies but operated by the State; 2,971 owned and operated by companies. Receipts, about \$68,905,000; expenses, \$38,275,000; surplus, \$30,630,000. The railroads are, on the whole, well managed, and have been profitable since the zone system for railway charges was introduced. The capital investment amounts to \$612,440,000.

Post-offices numbered 5,309 in 1905; there were 3,707 telegraph-offices, 23,719 kilometers of line with 128,315 of wire. Hungary had 178 telephone systems with 190,962 kilometers of wire. The receipts for the united postal and telegraph service were 51,207,000 kr.; expenses, 44,702,000; surplus, 16,505,000.

(For army and navy, see article AUSTRIA-HUNGARY.)

III. Social Reform

The Social Democrats are the most active in this line. At the congress of 1904 665 representatives attended, against 234 in 1902 and 349 in 1903. The revenues amounted to 134,000 crowns, against 43,000 in 1902 and 60,000 in 1903; the number of communities represented in 1903 was 277, against 86 in 1902 and 165 in 1903.

The party recruits itself chiefly among the industrial laborers, and in an "international socialistic" party. Besides this party there is another Social Democratic Party, which chiefly recruits itself among agricultural laborers and the non-Hungarian rationalists; this party also held a conference, where 104 communities were represented. The tendency now, however, is to unity, and the recent Socialist successes in Austria have largely aided the Hungarian movement. Since 1904 a new party, the Christian Laborers, are also gaining influence, having formed in October a federation of all Christian labor-unions; this party is opposed to the International Social Democracy.

Trade-unionists number (1906) 71,000, as against 14,000 in 1902. They publish 21 periodical papers with 61,000 copies. In 1903 the income was 273,000 crowns, the expenditures 201,000; out of this 87,000 for the unemployed. The unions are nearly all Social Democratic.

It is not to be forgotten that, altho Hungary even now is chiefly an agricultural country, nearly all these organizations reach only the industrial laborers.

This does not mean, however, that there is not a very important agrarian labor question in this country. In 1894 there were very dangerous riots in the heart of Hungary which led to strong repressions and to a special legislation, especially in 1898. Also in the first half of 1904 there were strong agrarian movements in the Servian and Rumanian districts, repressed, however, by a governmental action making meetings impossible, and by a number of prosecutions against the socialistic press.

In 1905 the International Federation of Cooperation held its congress in Budapest. In Hungary there are chiefly credit and consumers' cooperations; the cooperation of producers is very rare. The chief organization of consumers' cooperation, Hangya, included in 1903 383 cooperative societies with 64,000 members, 1,500,000 crowns of capital, 9,000,000 of traffic, and about 250,000 of profits.

The Christian cooperative societies were 275 in 1903, with 41,000 members and about 5,000,000 crowns of traffic. There were in 1904 some 1,742 cooperative credit societies and 517 dairy societies.

At the Hungarian State Iron Works at Diós Győr not a little is done for the employees. Dining accommodations are provided for 4,000 (the largest hall of the kind in the world), with dinners for seven cents, a great organ playing during the meals. There are also schools, a summer swimming establishment, tennis-courts, and skating-ponds for winter. Some industrial betterment, too, is conducted at other State, industrial, mining, and railway enterprises as well as in private enterprises.

Compulsory industrial insurance is being developed. In 1891 employees in dangerous industries were compelled to contribute not more than 3 per cent of their wages to a fund insuring medical care and indemnity in sickness. The employer pays one third of the premiums. Insurance against accidents is now also compulsory even for agricultural laborers.

A Social Museum in Budapest was founded by the government in 1901, and contains chiefly those collections of books, monographs, and models which were to be seen at the International Exhibition of 1900 in Paris. The program of the

Social Museum is quite an exhaustive one. But no sufficient funds are provided.

It is perfectly clear that there is need of remedial legislation. Wages are low, hours long, living often expensive, and in many cases cleanliness impossible. Factory legislation is steadily progressing, however, and the number of inspectors is to be doubled. In 1906 over 8,000 factories were inspected in Hungary. The new "industrial law" is to decide the question of "Sunday rest" and workmen's compensation; to restrict female night-work; to protect children and workers of minor age; to introduce the principle of labor representation, hitherto unknown in Hungary; to institute industrial and commercial courts for the settlement of disputes between employer and employed; and, finally, to settle the strike question.

Independent of this comprehensive measure, the Hungarian Government is organizing labor bureaus throughout the country to be controlled by the State; and also the extension of the pawnshop system. Two other legislative acts are being framed, "taxation reform," by which means will be found to lighten the burden of the poor by exempting from taxation all whose income does not exceed the minimum essential to subsistence, and secondly, a "small holdings act," with a view to improve the lot of the peasant proprietors. Among several of the young Kossuthist deputies there exists a distinct tendency toward the advocacy of "women's franchise," and already meetings have been held in all parts of Hungary, and an organization formed.

Wages are generally very low. Agricultural laborers in 1904 averaged in summer scarcely thirty cents per day with board, and forty cents without. Carpenters earned from \$2 to \$5 per week.

Phelps Stokes at Noroton, Conn., May 23, 1903. Organizing secretary Chicago Bureau of Charities, 1896-1901. Chairman Investigating Committee, City Homes Association; superintendent Municipal Lodging House, member Small Parks Commission, resident Hull House, 1899-1902 (all of Chicago). Resident Toynbee Hall, London, and other English settlements, summer 1899. Headworker University Settlement, New York, 1902-3. Chairman Child Labor Committee of New York since 1902. Member of Commission for Prevention of Tuberculosis, director Metropolitan Parks Association, president Social Reform Club, 1905.

Hunter is author of "Tenement Conditions in Chicago," 1901; "Poverty," 1904; and many magazine articles on social problems. Joined Socialist Party in 1907. Address: Highland Farm, Noroton, Conn.

HUNTINGTON, FREDERICK DAN: Episcopal bishop; born at Hadley, Mass., 1819. He graduated at Amherst College, 1839, and at Cambridge Divinity School, 1842. Entering the Unitarian

ministry, he held a pastorate in Boston, and from 1855-60 was Professor of Christian Morals and preacher at Harvard University. In 1860 he entered the Episcopal Church and became rector of Emmanuel Church, Boston, and in 1869 Bishop of Central New York. Besides many religious books, he has written numerous magazine articles on religious and social problems with kindred subjects. He was president of the Church Association for the Advancement of the Interests of Labor (q. v.), and of the Church Social Union (q. v.). Author of numerous religious books and papers. Died 1904.

HUXLEY, THOMAS HENRY: Scientist; we consider here for his contributions to social science. Born at Ealing, Middlesex, England, in 1825, he studied at Charing Cross Hospital and at the University of London. As assistant surgeon in the royal navy he sailed round the world and made many observations in natural science. In 1854 he became Professor of Natural History in the School of Mines, and Professor of Physiology. From 1863-69 he was professor in the Royal College of Surgeons. He was president of various scientific societies, from 1870-72 on the London School Board, and in 1893 privy counselor. Died 1895. He has been a careful student of biology, yet few men have done more to popularize science by his lectures and his numerous writings. Mr. William M. Salter thus describes his social positions (we abridge his account):

Society, he held, came into being when mutual war gave way to mutual peace—and it "most nearly approaches perfection as the war of individual against individual is most strictly limited." The "eternal competition of man with man and of nation with nation" did not please him. He put his hand on the weak spot in the laborer's situation when he said that it is the competition of laborers with one another that makes the capitalist's strength.

Huxley was no optimist, and yet he saw no limit to the extent to which "intelligence and order, guarded by sound principles of investigation, and organized in common effort, may modify the conditions of existence for a period longer than that covered by history." With due regulation of its numbers and due ordering of its industrial life, Huxley thought that a society might even now eliminate poverty and want (save such as arose from moral delinquencies or unavoidable calamities). Whether any society would actually rise to this height remained, of course, to be seen. Huxley was only sure that if some advance was not made in this direction, it was an open question whether the life of the race was worth preserving.

If there was no hope of a large improvement of the condition of the greater part of the human family, he declared he should welcome the advent of some kindly comet that would sweep the whole affair away.

HYGIENE. See SANITARY SCIENCE.

HYNDMAN, HENRY MAYERS: English Socialist leader; born in 1842; educated at Trinity College, Cambridge. Taking his degree in 1864, he entered the Inner Temple in 1865, but as special correspondent for the *Pall Mall Gazette*, went through the Italian campaign of 1866. From 1868-70 he traveled through the United States and Australia. In 1877 he published books on "The Indian Famine" and the "Crisis in India," which brought prominently into public notice the appalling condition of Indian affairs. At the general election of 1880 he was an unsuccessful Independent candidate for the parliamentary seat of Marylebone, London. In the same year, with several others, he raised an agitation in England against Mr. Gladstone's "coercion policy" in Ireland, and several times he had narrow escapes from being mobbed by the Liberals for his outspoken denunciations. In Jan., 1881, was founded, mainly through his efforts, the Democratic Federation, which soon became a distinctly Socialist organization, and grew into the Social Democratic Federation. From that time forward he has been closely identified with this organization, speaking and writing unceasingly. In 1886 he was tried, with Messrs. Burns, Champion, and Williams, for "uttering seditious and inciting to violence" in a speech made at a meeting of the unemployed in Trafalgar Square. After a trial lasting three days they were all acquitted. His first Socialist publication was "England for All" (1881), followed by "The Historic Basis of Socialism in England" (1883); "The Social Reconstruction of England, a Summary of the Principles of Socialism" (1884). He is still the leading member of the Social Democratic Federation, and constantly contributes to *Justice*, its organ. A man of means, no one has more absolutely devoted his whole life to the cause of socialism. Address: 9 Queen Anne's Gate, St. James's Park, S. W., London, England.

I

IBSEN, HENRIK: Dramatist; born at Skien, Norway, 1828. Apprenticed to a druggist, he early left the pharmacy for literature. In 1854 he was appointed director of the theater at Bergen; 1857 at Christiania. In 1866 he received a pension and resided abroad at Dresden, Munich, and Rome till 1891, when he returned to reside at Christiania. His first drama, *Catiline*, was not considered a success, tho with marks of genius. He then turned to Norwegian historical subjects in *The Banquet at Solhang* and other dramas and found great success. He then turned to the satire of society in *Brand* (1866) and other plays, with still more popularity in Norway, and which have been translated into most European languages. *The Pillars of Society* (1877) was followed by *A Doll's House* (1879); *Ghosts* (1881); *An Enemy of the People* (1882); *Hedda Gabler* (1890); *The Master Builder* (1892); *When We Dead Awaken* (1900), and other dramas less known. These productions have been attacked as immoral, and have

been lauded as of the highest genius. They have done good service for social reform by showing some of the shams and weak spots of respectable society, as in part due to present economic conditions. Died 1906. See G. B. Shaw's *Quintessence of Ibsenism* (1893); Jaeger's *Henrik Ibsen* (1894).

ICARIA: A communistic settlement in the United States, begun in 1847, to embody the social ideals described in Cabet's romance *Voyage en Icarie*. CABET, a Frenchman, wrote his romance in 1839, and then, pressed by his friends, sought for an opportunity to carry out his ideas. He finally succeeded in making arrangements for an experiment on American soil. In his journal, *Le Populaire*, he announced the purchase of a considerable tract of land on the Red River, Tex., and a treaty by which Cabet was made the director of an intended colony, and the depository of all the funds, community of property being

the distinctive principle of the society. Accordingly, in 1848, an expedition of sixty-nine persons sailed to America as an advance guard, leaving Cabet himself and another company to follow soon after. But difficulties arose. They were attacked by the yellow fever, and, unable to endure the Texan climate, the survivors abandoned their claims and returned to New Orleans. Here Cabet met them, with 400 additional members. News, however, had been received in New Orleans of the proclamation of the republic in France, and many felt tempted to return. Cabet was denounced, but induced several hundred to keep on. Learning that the Mormons had abandoned their settlement in Nauvoo, Ill., he set out for that place, and settled there with his followers. The Icarians in Nauvoo numbered at one time 600. They met with some success in cultivating their land, established shops, pursued trades, and set up a printing-office; but instead of rejoicing in his prosperity, and laboring to increase it, Cabet was dreaming what he might do if he had half a million, as is evinced by his publication *Wenn ich \$500,000 hätte*.

It is said that Cabet developed a dictatorial spirit; but this is doubtful. He was in a difficult place, and had many rivals and enemies. He was even summoned back to Paris on a trumped-up charge of fraud, but was able to successfully defend himself before the tribunal. Returning to Nauvoo, he found it prospering; but dissension again arose, and Cabet was expelled. He went with some of his followers to St. Louis, where he died, 1856. His followers founded a colony at Cheltenham, which, however, did not endure. Meantime, the faction which had remained at Nauvoo, after many years of struggle, decided to remove, and 4,000 acres were bought by the Nodaway River in Adams County, Ia., in the town of Corning, and the colony moved there. Dissensions were, however, not over, and, finally, in 1880 two factions—the Young Party and the Old Party—having failed to live together, separated. The property was equitably divided by arbitrators; but through a technicality the old charter was lost, the Young Party obtaining a new one and the right to the name, with the original settlement; the Old Party found themselves obliged to found a New Icaria a mile farther east. The Young Party soon dissolved. The Old Party continued, but finally disbanded in 1895.

The essential principles of Cabet's communism were the equality of all and the brotherhood of man. Executive officers were elected every year, who were, however, only empowered to execute the orders of their fellow citizens, and could not so much as buy a bushel of corn without being authorized to do so by the society. The directors bought the goods needed by the Icarians twice a year at wholesale. Each one made known his wants previously to the semiannual purchases. "To each according to his needs; from each according to his ability" was the economic doctrine of the community. Marriage was essential according to Cabet's scheme, and wives highly honored. Not only was the strictest fidelity enjoined upon the husbands, but they were required to render special acts of homage to their wives.

The government was purely democratic. Concerning religion, the constitution of the community said: "The Icarian Community adopts as its religion the religion of Christianity in its primi-

tive purity, and its fundamental principle of fraternity of men and of peoples." Sunday was set apart as a day of rest and recreation. Walking, riding, visiting, fishing and dancing, with occasional amateur theatricals, were the amusements. In addition to the national holidays they celebrated two of their own, Feb. 3d, or the anniversary of the founding of the community, and the "Fête de Mais," or corn festival.

They lived in little houses in plots of ground bright with flowers around a central house, where they had their meals in common. They at one time published a little paper, the *Revue Icarienne*. See Albert Shaw's *Icaria* (1894), also Bulletin of the U. S. Bureau of Labor, No. 35.

ILLEGITIMACY: Illegitimacy is a social phenomenon, produced by the conjoint action of many different forces, both of impulse and restraint. While its varying rate is to some extent a register of the moral tone prevalent in communities governed by the same laws and customs, it cannot be assumed that in contrasting different nations, illegitimacy must inevitably constitute an index of equal value. A country may have a high rate of illegitimacy, not because its morals are debased, but because law and custom hinder early marriages, or make possible the legitimization of offspring by a subsequent marriage. Again, the practise of criminal abortion and the intentional prevention of conception may vitiate the credit which might seem to belong to a people having a very low rate of illegitimate births. In Mohammedan countries there is doubtless less illegitimacy than in most Christian lands; and before the Gentile invasion of Utah, an illegitimate birth is said to have been almost unknown. But making all deductions, it is obvious that a difference in the rate of illegitimacy in communities enjoying the same civilization and laws, must constitute to some extent a register of the popular sentiment regarding it.

Nor does illegitimacy necessarily indicate laxity of morals in every direction. Of the mothers of illegitimate children, Miss Muloch in her "Thoughts about Women" says that "Women who thus fall are by no means the worst of their station. I have heard it affirmed by more than one lady . . . that many of them are of the very best—refined, intelligent, truthful and affectionate." To this fact the greatest of romance writers—Scott, Goethe, Hugo, Hawthorne, Tolstoy and George Eliot—have also witnessed.

One of the most interesting facts regarding illegitimacy is the persistence of the phenomena with nearly the same frequency in the same country or community, year after year. In England, for example, during the last fifteen years, the rate of illegitimate births has oscillated between 39 and 42 per thousand births. So uniform is this national rate that the present writer in 1891 ventured to predict that of every thousand children who should be brought into the world in England and Wales during the year 1893, at least 42 or 43 would be illegitimate, and that the total number of such births would be about 38,000. When, in 1895, the statistics relating to the year 1893 were published in the report of the Registrar-General, these predictions were found to be exactly correct. (V. "Illegitimacy," p. 9.) So assuredly can dependence be placed upon the uniformity of the laws which govern human conduct, that the results that will occur through

passion and folly can be predicted years in advance.

The rate of illegitimacy for purposes of comparison may be estimated by several different methods. It may be calculated by the proportion which such births bear to the total population of a country, or by the ratio which they bear to the totality of births, or, best of all, to the number of unmarried females between the ages of 15-45. The following table gives for several countries the rate of illegitimacy per 10,000 population during two periods: the first for the years 1880-81, the second for the four years 1901-4:

| COUNTRIES | Two years 1880-81 | Four years 1901-4 |
|------------------------|----------------------|----------------------|
| Austria..... | 62 | 57 |
| Saxony..... | 64 | 52 |
| Bavaria..... | 59 | 48 |
| Sweden..... | 29 | 33 |
| Denmark..... | 36 | 32 |
| Prussia..... | 33 | 30 |
| Italy..... | 35 | 25 |
| France..... | 23 | 23 |
| Norway..... | 25 | 22 |
| Belgium..... | 27 | 22 |
| Scotland..... | 18 | 17 |
| New Zealand..... | 18 | 12 |
| England and Wales..... | 19 | 11 |
| Ireland..... | 6 | 5 |

How America would compare with other nations in this respect, there are no means of telling. No civilized country on the globe is so destitute of information regarding the "Movement of the Population" in this and other respects as the United States. Since none can tell the number of suicides or murders which annually occur within the American borders, it is not to be expected that the number of births be known.

Two facts are evident from the foregoing figures. Compared with the rates of twenty years since, it would appear that, with few exceptions, illegitimacy is slowly decreasing. But to what cause is due this great diversity in tendency to illicit relationships which these figures make apparent? (1) It cannot be due to religious faith, so far as that means the acceptance of a particular creed. A higher appreciation of chastity cannot be ascribed to Protestantism, for

Causes

in Norway and Sweden, in Scotland and Denmark the rate of illegitimacy is far greater than in Ireland where Catholicism has the stronger hold. A superior moral efficiency cannot be detected in Catholicism as a deterrent from passionall irregularity; since in Austria, in Saxony and Bavaria the rate of bastardy far exceeds that of England and Scotland. Even if two nations of even greater divergence in faith—Christian and non-Christian—are contrasted the advantage is not as we might suppose. Take Japan, for example. Its chief religious force is Buddhism. In 1902 the proportion of illegitimacy to total population of Japan was 30—a rate surpassed by five of the nations of Europe, three Catholic and two Protestant. In England, the counties of Norfolk and Hereford during four years (1899-1902) showed about the same proportion of illegitimate births as were born in the northern and central provinces of Japan.

(2) The differences in rate of illegitimacy cannot be ascribed to differences in degree of education. Districts or countries where a high

standard of elementary education prevails show no superiority over those where ignorance is the rule. In France, excluding Paris, it has been noted that illegitimacy is least in departments where illiteracy is most general.

(3) In proportion to the total number of births, the rate of illegitimacy is often greater in the country districts than in large cities.

Contrast, for instance, the rate of illegitimate births in three great cities of England with the rate which prevails in certain rural districts of the same land:

| CITY | 1901 | 1902 | 1903 | 1904 | 1905 |
|------------------|------|------|------|------|------|
| London..... | 37 | 36 | 36 | 38 | 38 |
| Birmingham..... | 33 | 40 | 35 | 39 | 40 |
| Manchester..... | 27 | 32 | 32 | 35 | 30 |
| REGION | | | | | |
| Cumberland..... | 58 | 57 | 61 | 59 | 56 |
| Norfolk..... | 64 | 61 | 64 | 62 | 65 |
| North Wales..... | 59 | 60 | 56 | 58 | 60 |

Outside of England, however, this rule appears reversed. Paris, Vienna, Berlin, and other capital cities show a higher rate of illegitimacy than prevails in rural districts about them. In the case of Paris, this is largely due to the number of working people whose unions, unauthorized by Church or State, are orderly and decent in other respects. Dr. Bertillon has estimated these to be about 10 per cent of the whole number of homes.

(4) A high rate of illegitimacy is not due to poverty or chronic want. In North Ireland, where prosperity is greatest, the proportion of such births is far greater, every year, than in the south and west of Ireland where destitution is more general. An interesting comparison is afforded by certain registration districts of London. In this city, the fashionable and aristocratic quarters are in the West End; the districts which make up the East End of London are densely populated by the poorer class. The following table gives the rate of illegitimacy to each thousand births during four consecutive years:

| LONDON | 1901 | 1902 | 1903 | 1904 | 1905 |
|---------------------------------|------|------|------|------|------|
| East End: | | | | | |
| Stepney..... | 12 | 11 | 9 | 10 | 18 |
| Bethnal Green..... | 13 | 12 | 15 | 14 | 13 |
| Mile End, Old town..... | 15 | 11 | 13 | 16 | 16 |
| Whitechapel..... | 22 | 20 | 24 | 24 | 19 |
| West End: | | | | | |
| St. George, Hanover Square..... | 40 | 52 | 45 | 47 | 45 |
| Kensington..... | 48 | 49 | 44 | 45 | 49 |
| Fulham..... | 43 | 43 | 42 | 45 | 45 |
| St. Marylebone..... | 187 | 181 | 186 | 185 | 198 |

It will be seen, then, that in a great city like London, the quarters where dwell the poorest of its population are the districts least affected by illegitimacy of births. This characteristic persists in the same neighborhoods year after year. In 1876 almost the same differences were to be found.

For the real causes of that singular difference in proclivity toward illegitimacy, whether in nations or neighborhoods, one must look to certain hereditary influences. This does not mean that some mysterious and inscrutable force impels one

class of people more than another either to irregular relations or to vice and crime; but only that in different nations and in different communities, even granting proclivity to be the same, *the deterrent influences are unequally felt*. Certainly, one of the strongest deterrents from wrongdoing is the condemnation of public sentiment. In whatever community or country the birth of an illegitimate child is lightly regarded as a mishap by no means of infrequent occurrence among neighbors and relatives, there the annual rate of illegitimacy will be greater than where such a birth inflicts upon the mother a stigma of disgrace. We see the effect of sentiment exemplified in other phases of human conduct; where private vengeance is secretly condoned and approved, as in Corsica and Sicily, there assassinations will take the place of appeal to law; where divorce brings no obloquy, there divorces will be frequent, and where the lynching of negroes for certain crimes is regarded with approval, there appeal to lynch law will constantly occur. To weigh this subtle influence of opinion, to ascertain how far it obtains in one community more than in another, is only possible by a study of its effect upon human conduct generation after generation.

Illegitimacy in nearly all European countries appears to be slowly decreasing. This is evident from the figures given in the first table herein presented. In England and Wales, the illegitimate birth-rate, when calculated upon the total number of unmarried women between the ages of fifteen and forty-five, for periods of three years immediately following the census year indicates a reduction of 50 per cent from the rate prevailing thirty-five years ago.

ENGLAND AND WALES

| YEARS | Rate per 10,000 |
|--------------|--------------------|
| 1870-72..... | 170 |
| 1880-82..... | 141 |
| 1890-92..... | 105 |
| 1900-2..... | 85 |
| 1903..... | 84 |
| 1904..... | 84 |
| 1905..... | 83 |

Little can be said regarding the lessening of illegitimacy. In some countries, legislation which should remove all impediments to marriage would undoubtedly have effect; but probably it would tend to increase the number of unhappy unions, and the tendency to divorce. Everywhere a strong social condemnation appears to decrease prevalence; but pushed too far, even this may provoke a tendency to infanticide. One may be fairly confident, however, that whatever makes for the sincerest and widest appreciation of conjugal life and domestic happiness will tend to diminish those transitory and irregular relationships from which come the majority of illegitimate births.

ALBERT LEFFINGWELL.

ILLITERACY: One of the main indications of the advance of civilization in modern times is the spread of popular education. Nevertheless the

number of illiterates, even in many civilized countries, is still very large. In the United States the proportion of illiterates is kept large by the illiteracy of the colored population and by that of some classes of immigrants.

IMMIGRATION: In America the term "immigration" is usually applied to the movement of population to the United States since the founding of the national government, as contrasted with the "colonization" of earlier periods. In the thirteen original states the pioneers were practically all Teutonic and Celtic,—British, Irish, Dutch, and German,—with a few French, Portuguese, and Swedes. The total population of the U. S. in 1790 was about 4,000,000 souls, and it is estimated that the total immigration from that date to 1820, when records first began to be kept, was about 250,000 souls.

The total immigration since 1820, by decades, has been as follows:

| | |
|-------------------|-----------|
| 1821 to 1830..... | 143,439 |
| 1831 to 1840..... | 599,125 |
| 1841 to 1850..... | 1,713,251 |
| 1851 to 1860..... | 2,598,214 |
| 1861 to 1870..... | 3,314,824 |
| 1871 to 1880..... | 2,812,191 |
| 1881 to 1890..... | 5,246,613 |
| 1891 to 1900..... | 3,687,564 |
| 1901 to 1905..... | 3,833,076 |

Total—1821 to 1905..... 22,948,297

The largest annual totals in recent years have been as follows:

| | |
|-----------|-----------|
| 1882..... | 788,992 |
| 1892..... | 623,084 |
| 1902..... | 648,743 |
| 1903..... | 857,046 |
| 1904..... | 812,870 |
| 1905..... | 1,026,499 |

The only times when immigrants have exceeded 1 per cent of the population into which they came were 1847-54, 1870, 1873, 1881-83, and 1903-5.

The number of emigrants cannot be accurately stated but probably averages between one quarter and one third of the arrivals. In 1905 over 17 per cent of immigrants arriving had been in the U. S. before; many go back and forth a number of times.

Immigration is due in general to a desire to benefit one's condition. This is proved by the invariable relation between the number of immigrants and industrial conditions in this country. Other causes are religious persecution and political oppression abroad; the solicitation and assistance of friends and relatives in the U. S.; the increased facilities and diminished cost of travel; the efforts of foreign governments, municipalities and charitable organizations to rid themselves of the burden of dependents and delinquents; and last and most important, the solicitation of steamship agents both abroad and in this country. Owing to the last factor, much of the present immigration is not a spontaneous movement of population, but one artificially stimulated by the transportation interests, which make a profit of \$15 to \$20 on each immigrant. The tariff also operates as a cause by making it easier for the workman to come than the goods which he produces.

The most important characteristic of recent immigration, next to the increase in its volume, is the change in its racial composition. There were three principal waves of migration during the nineteenth century: one of the Irish, beginning in the forties and following the potato famine; another of the Germans, caused by the revolution of 1848 and the subsequent political upheavals; and the third, somewhat later, from the Scandinavian countries. Up to 1880 the bulk of immigration was from Teutonic stock, akin in habits and institutions to the original settlers. In the last twenty-five years, however, a profound change has occurred, and the immigration of to-day is chiefly of Iberic, Slavic, Semitic, and Asiatic races.

This is brought out by the fact that in 1860 immigrants from Austria-Hungary, Italy, Poland, and Russia were about one hundredth of those from the United Kingdom, France, Germany, and Scandinavia; in 1880, about one tenth; in 1894, nearly equal to it; in 1902, three and one half times as great. If we compare the total immigration of certain nationalities for the period 1821 to 1902 with that for the year 1903, we find the following result:

| COUNTRY | 1821 to 1902 | | 1903 | |
|----------------------------|--------------|----------|---------|----------|
| | Number | Per cent | Number | Per cent |
| Austria-Hungary..... | 1,316,914 | 6.5 | 206,011 | 24.0 |
| England, Wales..... | 2,739,937 | 13.4 | 26,219 | 3.0 |
| Germany..... | 5,098,005 | 24.9 | 40,086 | 4.7 |
| Ireland..... | 3,944,269 | 19.3 | 35,300 | 4.1 |
| Italy..... | 1,358,597 | 6.7 | 230,622 | 26.9 |
| Norway, Sweden..... | 1,334,931 | 6.6 | 70,489 | 8.2 |
| Russia, Poland..... | 1,106,362 | 5.4 | 136,093 | 15.9 |
| British North America..... | 1,050,682 | 5.1 | | |

In 1905, of the total immigration, 58.3 per cent was Slavic and Iberic, and 34.6 per cent was Teutonic and Celtic. The immigration from Asia was 23,925, or 2.3 per cent of the total, including 1,971 Chinese.

The largest elements in recent immigration have been as follows:

| | 1904 | 1905 |
|-----------------------|---------|---------|
| Southern Italian..... | 159,399 | 185,445 |
| Hebrew..... | 106,236 | 129,910 |
| Polish..... | 67,757 | 102,437 |
| German..... | 74,790 | 82,306 |
| Scandinavian..... | 61,029 | 62,284 |

The economic gain from immigration is, of course, immense, and it would be difficult to give it a money value. The amount of money brought by immigrants in 1905 was over \$25,000,000, or

about \$25 per capita. Much of this sum, as well as the passage money of probably one half of the immigrants, was wholly or partially furnished by friends or relatives in the United States. The more intelligent races, as a rule, bring the most money. It is probable that the savings and remittances sent home annually by immigrants already here amount to from two to three times the amount brought in each year.

Of the total immigration, only about 15 per cent are skilled or professional persons. About 80 per cent are entirely unskilled, and without knowledge of any trade or means of livelihood. The countries of northwestern Europe furnish the largest proportions of skilled immigrants.

The total illiteracy of immigrants over fourteen years of age, in 1905, was 26.2 per cent. The females are, in general, more illiterate than the males. The illiteracy of the races contributing more than 2,000 immigrants was for the same year as follows:

| NORTHERN AND WESTERN EUROPE (Chiefly Teutonic and Celtic) | |
|--|------|
| Scandinavian..... | 0.6 |
| Scotch..... | 0.7 |
| English..... | 1.3 |
| Bohemian and Moravian..... | 1.7 |
| Finnish..... | 1.8 |
| French..... | 2.7 |
| Irish..... | 3.8 |
| German..... | 4.2 |
| Dutch and Flemish..... | 5.3 |
| Italian (North)..... | 14.0 |
| Average..... | 3.7 |

| SOUTHERN AND EASTERN EUROPE (Chiefly Slavic and Celtic) | |
|--|------|
| Spanish..... | 10.1 |
| Magyar..... | 11.6 |
| Greek..... | 22.4 |
| Slovak..... | 25.0 |

| Russian..... | 30.8 |
| Croatian and Slovenian..... | 38.2 |
| Dalmatian, Bosnian and Herzegovinian..... | 38.4 |
| Bulgarian, Serbian and Montenegrin..... | 38.9 |
| Polish..... | 39.6 |
| Italian (South)..... | 50.4 |
| Lithuanian..... | 56.9 |
| Ruthenian..... | 62.6 |
| Portuguese..... | 66.7 |
| Average..... | 42.2 |

| OTHER RACES | |
|----------------------|------|
| Chinese..... | 5.0 |
| Cuban..... | 7.7 |
| African (black)..... | 15.8 |
| Hebrew..... | 23.3 |
| Japanese..... | 39.3 |
| Syrian..... | 53.0 |

In 1900, of the 10,356,644 foreign born in the U. S., the North Atlantic division contained 22.6 per cent; the North Central, 15.8 per cent; the Western, 20.7 per cent; leaving only 4.6 per cent for the South Central and South Atlantic divisions combined. This shows the tendency of immigrants to settle in certain sections of the country. Indeed, of the total immigration of 1905, 65.3 per cent were destined to Illinois, Massachusetts, New York and Pennsylvania, and only 8.7 per cent to the Southern and Western States. Within these states the recent immigrants, in contrast with the earlier ones, tend, almost entirely, to live in the large cities. Thus, in 1900, the foreign born who were one eighth of the total population furnished one fourth of the population of the cities. Southwestern Europe furnishes three times as many inhabitants as northwestern Europe to the slums of Baltimore, nineteen times as many to the

slums of New York, twenty times as many to the slums of Chicago, and seventy-one times as many to the slums of Philadelphia.

In 1899 the total immigration was divided as to religious belief as follows: Roman Catholics, 52.1 per cent; Protestants, 18.5 per cent; Jews, 10.4 per cent; Greek Catholics, 4.0 per cent; Brahmins and Buddhists, 0.9 per cent; miscellaneous, 13.9 per cent.

The good effects of immigration in building up the country and developing its industries are so obvious as not to need discussion.

The bad effects of immigration are due both to those whom it introduces and to those whom it prevents being introduced. Considering the second effect first, it is a fact that the recent large

Effects

immigration of unskilled and illiterate races has turned the more skilled and intelligent of all races to the other countries. But more important still is the lowering of the birth-rate of those already here and ultimately of the immigrants themselves, and in raising the birth-rate in the countries from which the immigrants come, thus keeping the source of the flow undiminished. The number of white children in the U. S. five years of age to 1,000 white females fifteen to forty-nine years of age has fallen steadily from 781 in 1830 to 465 in 1900; although in the South, which has received practically no immigrants, the birth-rate has been nearly constant. Under a system of unselected immigration, all the benefits which might accrue from a careful selection of the best specimens of European races and their interbreeding to produce a still finer race here will be lost.

Immigration has stimulated the development of the factory and industrial system, and this has, in turn, produced an economic and social stratification. There seems to be no doubt that it tends to retard, at least in certain lines of work, the operation of the general tendency toward rising wages. It is true that the volume of immigration is sensitive to the law of supply and demand, but the fact that many recent arrivals have a low standard of living tends to nullify the working of this law. This low standard and the accompanying ignorance are responsible for the development of the sweat-shop and padrone systems of labor, as well as much unemployment at certain periods.

Immigration tends to retard the elimination of illiteracy in this country. In 1900 the average was 4.6 per cent for native whites, as compared with 12.9 per cent for foreign whites. The fact that the illiteracy of the children of immigrants was only 1.6 per cent, as compared with 5.7 for the children of natives, is due to the settlement of the former in states where education is well developed and compulsory.

In regard to criminal tendency, we find that, comparing male prisoners with the male population of voting age, in 1890, the numbers per million were as follows:

| Criminal Tendency | |
|------------------------------------|-------|
| Native white, native parents..... | 2.28 |
| Native white, foreign parents..... | 6.74 |
| Native white-total..... | 3.145 |
| Foreign white..... | 3.970 |

In other words, the foreign whites were nearly one and one half times as criminal as the natives of native parentage; and the natives of foreign parentage were over three times as criminal.

Comparing male juvenile offenders with the

male population of school age, for the North Atlantic division, we find the figures to be, per million, as follows:

| | |
|-------------------------------------|-------|
| Native white, native parents | 855 |
| Native white, foreign parents | 2,740 |
| Foreign white | 2,252 |

This means that the children of immigrants are nearly one quarter more criminal than the immigrants themselves, and more than three times as criminal as the children of natives.

Immigrants are also responsible for the increase of various diseases such as trachoma, tuberculosis, and smallpox, and their ignorance increases the difficulty of sanitation.

Disease and Insanity

The last epidemic of yellow fever in New Orleans was largely due to this cause. The foreign-born population in 1890 also furnished two and one third times its normal proportion of insane persons; and the males of foreign birth and parentage furnished three times as many paupers per million of voting population as those of native birth and parentage. The proportion of paupers who are foreign born has increased steadily since 1850.

In 1904 there were 44,985 alien inmates of penal, reformatory and charitable institutions in the U. S., of whom more than one half were in Massachusetts, New York, Pennsylvania and Illinois. An alien population, 1.3 per cent of the total population, furnished 11 per cent of all the inmates of these institutions.

The U. S. took the control of immigration from the states in 1882. The principal laws at present in force are the Act of March 3, 1903, the Contract Labor acts of Feb. 26, 1885, and Feb. 23, 1887, and the Chinese Exclusion acts.

Legislation

The Act of 1903 provides for a head-tax of \$2 on every alien not a citizen of the U. S., Canada, Cuba, Newfoundland, or Mexico. It excludes from admission to the U. S. the following: (1) idiots; (2) insane persons; (3) epileptics; (4) persons who have been insane within five years previous to arrival; (5) persons who have had two or more attacks of insanity at any time previous; (6) persons likely to become a public charge; (7) professional beggars; (8) persons afflicted with a loathsome or with a dangerous contagious disease; (9) persons who have been convicted of a felony or other crime or misdemeanor involving moral turpitude, not including those convicted of purely political offenses; (10) polygamists; (11) anarchists, or persons who believe in or advocate the overthrow by force or violence of the government of the U. S. or of all government or of all forms of law, or the assassination of public officials; (12) prostitutes; (13) persons who procure or attempt to bring in prostitutes or women for the purpose of prostitution; (14) those who have been within one year from the date of application for admission to the U. S., deported as being under offers, solicitations, promises or agreements to perform labor or service of some kind therein; (15) any person whose ticket or passage is paid for with the money of another, or who is assisted by others to come, unless it is affirmatively and satisfactorily shown that such person does not belong to one of the foregoing excluded classes; but any person in the U. S. may send for a relative or friend without thereby putting the burden of this proof upon the immigrant. The Contract Labor laws exclude all alien la-

borers, mechanics or artisans who are under contract, express or implied, to perform labor in the U. S. They do not apply to skilled laborers, if others of like kind unemployed cannot be found in this country, to professional actors, artists, lecturers, singers, ministers of any religious denomination, professors for colleges or seminaries, persons belonging to any recognized learned profession, or persons employed strictly as personal or domestic servants.

Under the Chinese Exclusion acts all Chinese are now excluded except: (1) officials; (2) teachers; (3) students; (4) merchants; (5) travelers for curiosity or pleasure (these five classes of persons must have certificates of identification from the Chinese Government or the government of which they are subjects); (6) Chinese merchants domiciled here who have temporarily departed (these must have certificates required by the Act of Nov. 3, 1893); (7) minor children of domiciled merchants; (8) wives of officials; (9) personal servants of officials; (10) Chinese laborers registered under the "Geary" Act of May 5, 1892.

The Act of 1903 provides that persons becoming a public charge within two years after landing from causes arising prior thereto shall be deported, and that persons entering in violation of law may be deported within three years to the country whence they came. In 1905 there were 11,480 debarred and 845 returned. In general the percentage of debarred and returned, to the total immigration, varies from 0.4 to 1.4.

It has been proposed to strengthen the present laws by increasing the head-tax, defining more accurately the term "liable to become a public charge," and by excluding those who cannot read in any language. The last provision passed Congress in 1897, but was vetoed by President Cleveland.

PRESCOTT F. HALL.

Of the whole number of immigrants in the fiscal year ending June 30, 1906, 880,036 came through the customs district of New York, 54,064 through Baltimore, 62,229 through Boston, 23,186 through Philadelphia, 4,138 through San Francisco, and 77,082 through other ports; also 43,997 through Canadian ports.

The reported occupations of immigrants arriving during the fiscal year 1906 were as follows: Laborers, 226,345; servants, 115,984; farm laborers, 239,125; tailors, 26,982; merchants and dealers, 27,054; carpenters, 18,185; shoemakers, 12,622; clerks, 11,345; mariners, 8,737; miners, 8,717. The number of professional immigrants (including 1,117 actors, 3,324 engineers, 1,511 musicians, and 2,071 teachers) was 13,766; of skilled laborers, 177,122; miscellaneous (including unskilled), 624,387; no occupation (including children under fourteen years of age), 285,466.

The total number of alien immigrants refused admission to the U. S. in the fiscal year ending 1905 was 12,432, of which 7,069 were paupers or persons likely to become public charges, 2,273 persons with loathsome or contagious diseases, 2,314 contract laborers, 139 insane, 92 idiots, 203 convicts, 30 prostitutes, 2 persons who attempted to bring in prostitutes, 61 returned in one year after landing, 615 returned within three years because here in violation of law.

More than one quarter of recent immigration is Italian, nearly one quarter Hungarian; more than one half are Italian, Hungarian or Russian (largely Hebrew). Their percentage of illiteracy is respectively, 43, 24 and 25 per cent.

Mr. Robert Hunter, of the University Settlement in New York, says:

The fathers and mothers of the American children can be chosen, and it is in the power of Congress to decide upon what merits. . . . No nation has ever had a social responsibility of greater magnitude. The future of American society, industry, religious faith, political institutions, may be decided in a way quite marvelous by the governing powers of this country. The worst aspect of the whole matter is that the selfish forces interested in promoting immigration in every conceivable way are deciding all these questions for us. The ones who come and the numbers who come depend largely upon the steamship companies. . . . Whether we have more Hungarians than Italians, or Syrians than Greeks, or Scandinavians than Slavs, depends to a very large extent upon their ports, their

passage rates and their success in advertising and soliciting. . . . I believe that this country may be ruined by leaving the volume and quality of immigration almost entirely to the decision of the steamship companies. . . . The skill of their agents decides whether we shall have one race or another come in great masses to our shores. . . . If we let the steamship companies and the railroads, wanting cheap labor, alone, we shall not decide what immigrants will be better for coming, and what ones the country needs. They will decide it for us. . . . Our governing bodies . . . in the past . . . have failed to consider the welfare of the people, either immigrants or Americans. The decision has been made as a result of pressure brought to bear upon public officials by private and selfish interests. Our national characteristics may be changed; our love of freedom, our religion, our inventive faculties, our standard of life. All of the things, in fact, for which America has been more or less distinctive among the nations may be entirely altered. Our race may be supplanted by another, by an Asiatic one, for instance, and not because it is better so, nor because it is for the world's good. On the contrary, it is in order that individuals interested in steamships may be benefited, and in order that employers may have cheaper labor. These selfish forces may be disguised, but they are there.

Mr. Ernest Crosby in the *Arena* writes:

Immigrant children learn quickly in our schools, and most of them, especially the Jews from eastern Europe, and the Italians, take high positions, holding their own, as a rule, with our native-born children. Where we fall short too often is in physique. More of us are hollow-chested, sloping-shouldered, and nervous than is the case with the ordinary European, and especially with the peasant. From the purely scientific standpoint of breeding, we have every interest to admit the sturdy farm hand, just as we import the Percheron horse or the Southdown sheep. Whether the man can read and write or understand the Constitution is a matter of trifling importance in comparison. His children will learn all that quickly enough. But he will not know how to vote, we are told. When you consider the fact, however, that nearly one half of our educated Americans vote diametrically against the other half, it is hard to see how the addition of a few uneducated voters can do much harm. Whichever way the ballot of the immigrant is cast, he will have about half of the American people with him, and they should bear the responsibility for the result, not he. Examinations in the three "R's" let in the anemic crook and sharper and "shyster lawyer," the gambler and the pawnbroker, and all that precious parasitic fraternity which lives by its wits and gravitates to the cities, shutting out the independent, self-supporting, brawny son of the soil whom most we need. I cannot in justice overlook our faults nor be blind to the fact that the good points of other races supply our deficiencies, and I have already hinted at some of them. In the great century of music, none of our blood produced a work of even the third class. We have never had a painter who could rank among the first score or two of great artists. We must go to Germany for our highest philosophy and to France for the most finished elegance of thought and manners. We know little of the joy of living. We take our holidays sadly, and laugh with mental reservations. The Europeans come to us with a new capacity for mirth, a genius for joviality and sociability. Are these ingredients to be despised? For a few years he may navigate our streets with his hand-organ or his plaster-casts and frequent his genial café, but before long he must fit himself to our Procrustean bed, and at last we find him at work in the regulation store or at rest before the rigid bar or at the taciturn dairy-lunch counter. Is it desirable that we should compass sea and land in this way to make a proselyte? Should we reduce the whole world to one dead level? And not content with stifling the originality of the immigrant, we must needs carry our missionary zeal for uniformity to foreign lands in the hope of destroying all individuality. In Anglo-Saxonizing India and Japan we are crushing out the most wonderful of arts beyond a possibility of resurrection. We are the Goths and Vandals of the day. We are the Tartars and the Turks. And the countries which we overrun have each its own priceless heritage of art and legend which we ruthlessly stamp under foot.

IMMIGRATION RESTRICTION LEAGUE: Organized 1902 for the purposes stated in its name. It has been active in agitating for legislation, and in the publication of literature and statistics upon the subject. (See IMMIGRATION.) Secretary, Prescott F. Hall, State Street, Boston, Mass.

INCOME TAX: The income tax is a direct levy by a government upon the income of individual citizens, whether that income is received from labor, industry, investments, real estate, or any other source. It is generally computed per annum, but sometimes every three or four years.

Some technical terms and phrases pertaining to the subject need to be explained. *Exemption* from taxation means that small incomes are free, the State holding that the amount of income required for the maintenance of independence and of the standard of living should not be taxed, since it would not only have to return in the form of charity what it took in that of taxes, but would, moreover, undermine the morale of its citizens by depriving them of the necessities of life. The excess only is, consequently, to be taxed. *Stoppage at source* has to do with collection of the tax. It indicates that the tax is subtracted from the salary, interest on bonds, dividends on stock, etc., owned by the payer. The paymaster of the navy and army, the Bank of England, and the treasurers of corporations in England always withhold the amount of the tax from the amount due the payee. *Uniform* or *proportional* taxation means that all incomes are subject to the same rate, e. g., 1 per cent, or 3 per cent. A tax is called *graduated* or *progressive* when the rate of taxation increases with the amount of income, e. g., 2 per cent on \$1,000 and 3 per cent on \$4,000. *Regressive* means that a certain amount of taxable income is exempt, e. g., in England a man with an income of £400 has £150 free and is taxed only on £250. The term *regressive* is used to indicate that the rate of taxation increases as income decreases. This form was applied in France before the Revolution. Taxation may, finally, *differentiate* between various forms of income and tax them unequally; e. g., income from farm land is taxed at a lower rate in England than that from real estate in the cities. The differentiation may extend to income from labor, property, permanent and temporary incomes, investments in public and private securities.

HISTORY

Nearly all European countries impose an income tax as a means of revenue. England was the first country to levy this tax. Much money was needed during the Napoleonic wars. Pitt presented his bill for the income tax in September, 1798; it provided that incomes of £60 and under should be exempt, while those over this amount were subject to a progressive tax at the rate of $\frac{1}{4}$ per cent to 10 per cent. It was an additional duty of "assessed taxes," and lasted until the peace of Amiens in 1802. In 1803 Addington presented a bill which contained many changes, and was made the basis of the one passed in 1842, altho it was abolished in 1816, since the people had

Terms and Forms

England

considered it a war measure and clamored for its repeal. Popular resentment made the passing of any income-tax bill impossible for twenty-five years. In 1842 the Corn Laws aroused the people with the tax on food. They had to be repealed, but the revenue lost by that act had to be made up in some other way. Robert Peel introduced a bill on the income tax, and defended it in a speech lasting three hours and a half. It was carried amid tremendous applause by a vote of 255 against 149. The tax was extended by Peel in 1845 and later, in 1853, by Lord Russell under the name "Income Tax Act," and remained practically unchanged until 1880. In that year the "Taxes Management Act" was passed. Gladstone called it "a code or system of taxation," since it was not so much an income tax but rather a system of raising revenues. It provides for the classification of all taxable income under five divisions or schedules, called by letters from A to E. Schedule A. Income from land and houses.—B. Income of farmers.—C. Income from interest and dividends.—D. Income from commercial, industrial, and professional men, and corporations.—E. Income from salaries and pensions. Railroads, mines, canals were originally in division A, but have since been placed under D. The standard of taxation is eightpence to the pound, and all differentiations are made in regard to it.

It is interesting to note a number of changes and exceptions. In 1842 incomes below £150 were exempt; in 1854 those below £100, the war in the Crimea calling for a larger revenue; in 1873 the degressive feature was introduced, since incomes from £100 to £150 had £80 exempt; in 1877 this feature was increased so that incomes from £150 to £400 had £120 exempt. A declaration is to be made every three to five years under schedule A; that is, the amount of rent is to be declared, since that is considered the income. In division D the declaration is based on the three prior years. Under schedules C and E no declaration is necessary, since stoppage at source takes place. Under schedule B—income of farmers—the rent is regarded as the income, and that was taxed at four pence per pound in England, and three pence in Scotland and Ireland; since 1894 all farmers of Great Britain pay three pence per pound. In 1887 the law was amended so that land which brings in no rent is free from taxes. A change favorable to certain classes was made in 1890 to the effect that if any taxpayer suffered loss in commerce, industry, etc., he was to report the damage within six months, and have a corresponding amount of taxes returned. In 1894 the amount of income that is exempt was raised to £160, and incomes of £400 have £160 free instead of £120, those of from £400 to £500 have £100. In 1898 the "Abatements of Income Tax" made some new provisions; incomes from £400 to £500 were to have exempt £150; from £500 to £600 only £120; from £600 to £700 only £70. When a large amount of money was needed during the Boer War, the standard of taxation was raised from eight pence per pound to ten pence, later twelve pence, eventually fourteen pence; that is, after 1900. It has since been reduced.

The increase in the property which came under the income tax from 1880 to 1900 was in round numbers: England, £485,700,000 to £678,700,000, equal to 40 per cent; Scotland, £55,100,000 to £75,800,000, equal to 49 per cent; Ireland experienced a decrease from £36,100,000 to £33,-

400,000, equal to 8 per cent. Even this decrease in the latter country is an increase per head, since the population of Ireland declined from 5,203,000 to 4,466,000 during this period. The increase in property per head of the population was: England, £18.5 to £21.13 per cent; Scotland, £14.8 to £17.14 per cent; Ireland, £6.9 to £7.5, 9 per cent. The increase in the rate of taxation was from 2.08 per cent to 3.33 per cent; it rose rapidly to 5.83 per cent in 1902 after the Boer War. The net revenue from the tax rose from £9,233,320 in 1880 to £18,828,952 in 1900, and to £35,980,000 in 1902, altho in the latter year incomes under £200 were exempt. The number of people who had over £150 income and paid taxes increased from 1,107,000 to 1,723,000 during the twenty years; that is, there was an increase of people paying the tax from 323 in 1880 to 425 in 1900 per 10,000 of the population.

This fairly full account of the income tax in England is given because that country has had the longest experience with it, has changed the law constantly to make it more equitable to new conditions, has raised a large revenue by it, and gives us, consequently, a typical case of the working of this tax. The results are: First, the tax has increased in popularity; second, it has proved that the wealth of the middle classes increases absolutely and relatively more rapidly than that of the rich; third, that the difference between the two classes is becoming smaller; fourth, that in times of financial or industrial depression the large incomes suffer proportionately more and are reduced more rapidly in number than the smaller.

All of the different states of Germany have an income tax. Prussia introduced this tax in 1811, and levies, at present, on all incomes above 900 marks. The tax is progressive, beginning with 0.6 per cent and rising to 4 per cent. Austria passed an income-tax law in 1812, and has at present a progressive tax beginning with 0.6 per cent on incomes of 600 florins and rising to 0.5 per cent on the highest. Hungary does the same. Since 1864 Italy taxes all incomes above 400 lire at a uniform rate of 12 per cent.

The provisions of the income-tax laws of the different parts of Germany are practically the same as those of Prussia, except in a few details. Holland and New Zealand passed laws on the income tax in 1893, which provided both for graduation and differentiation. Individuals and corporations are taxed, but holders of securities only through the corporations. A significant feature of the law of Holland is that it levies only on the net income. Denmark, Switzerland, Australia also levy a tax on income.

France proposes an income-tax law (February, 1907) which is very severe on large incomes, and punishes misstatements by quintupling the tax as well as by making it retroactive for five years. Exemptions are made in favor of incomes under 1,250 francs in places of 3,000 inhabitants, and 2,500 fr. in Paris; incomes in places of more inhabitants than the former and less than the latter are levied upon according to a schedule corresponding with the size of the city. Incomes above those exempted pay a proportional tax up to 5,000 fr. at the rate of 4 per cent on real estate and 3 per cent on labor; above 5,000 fr. the tax is strongly progressive, rising to 10 per cent on 500,000 fr. and over. The law is very complex in regard to the computation of incomes from

Results

Other Countries

various sources, mode of collection, etc. Stoppage at source is practised wherever possible. Foreigners pay taxes according to the amount of money spent.

The United States Congress has once proposed, in 1812, under Secretary Dallas, and twice passed income-tax bills. A measure was enacted in 1861

United States

as a fiscal expedient to raise revenues for the war. It provided that all incomes above \$800 should pay a uniform tax of 3 per cent; a differentiation was made in favor of interest on U. S. securities, on which only 1.5 per cent was levied. A discrimination against citizens of the U. S. living abroad was made; they had to pay 5 per cent, except on income derived from Federal securities. The duty was self-assessed according to schedules prepared for the purpose and levied on the total income, irrespective of the source. A penalty of 10 per cent was added in case of default to report. In 1862 the exemption was reduced from \$800 to \$600, and the rate was made slightly progressive, incomes between \$600 and \$10,000 paying 3 per cent, those above 5 per cent. Collectors were instructed not to open the returns to inspection; a ruling which laid the tax open to various evasions, and was soon reversed. The great demand for money induced Congress to pass a new measure on June 30, 1864, which was strongly progressive. Incomes between \$600 and \$5,000 were taxed at the rate of 5 per cent, those from \$5,000 to \$10,000 at 7.5 per cent, those above the latter sum at 10 per cent. The measure was rigorous and burdensome in many respects; and the differentiation in favor of income from U. S. securities was abolished. In 1865 two changes were made: incomes over \$5,000 were rendered taxable at the rate of 10 per cent, those below this sum down to \$600 at 5 per cent. The tax remained in force until 1872, several changes having been made, chief of which was a successive raise of exempt incomes from \$600 to \$1,000 and later to \$2,000. The revenue collected under the income-tax measure rose from \$2,741,858 in 1863 to \$72,982,159 in 1866, and gradually fell to \$5,062,341 in 1873.

The Wilson Tariff Act, passed Aug. 18, 1894, contained a provision for an income tax, since a deficit was feared owing to the reduction of import duties. As the dreaded deficit did not materialize, and since the apportionment among the states was not made according to population and representation, the Supreme Court of the U. S. declared this feature of the act unconstitutional on May 20, 1895, by a vote of five to four, before it became generally operative. This law proposed to levy a uniform tax of 2 per cent on all incomes over \$4,000.

Massachusetts has had an income tax since colonial times; incomes under \$2,000 are free as well as incomes derived from property already taxed. It is seldom levied. Virginia taxes all incomes over \$600 uniformly at 1 per cent. South Carolina has a progressive tax on incomes; exemptions are made in favor of salaries of State and Federal officials and on all incomes below \$2,500; from this figure up to \$5,000 the rate is 1 per cent; \$5,000 to \$7,000—1.5 per cent; \$7,000 to \$10,000—2 per cent; \$10,000 to \$15,000—2.5 per cent; over \$15,000—3 per cent. Some other states of the union have had income-tax laws at one time or another, e. g., Pennsylvania, North Carolina, Louisiana, but the tax was seldom and irregularly levied.

Adam Smith proposed four criteria of a tax: equity, certainty, convenience of payment, economy in collecting. The advocates of the income tax say that it meets all four of these tests; the opponents, that it meets none of them.

The tax is equitable because it taxes "large wealth heavily, small wealth lightly, least wealth not at all," according to the Jeffersonian doctrine that an equality of wealth must be preserved among the people. Each man should contribute to the support of the State according to his

Advantages ability and the amount of protection received, since great wealth needs and gets more protection proportionately, e. g., buildings, than the income of a day-laborer. This tax is, moreover, certain, since the State can always depend on the fact that its citizens have an income. The tax is, furthermore, convenient, because the time of payment is known long before it is due, and arrangements can be made accordingly. It is, finally, economical, since, if self-assessed, the schedules prepared enable each man to ascertain how much he has to pay, and he can send in the amount at the proper time, so that practically no expenses need be incurred in collecting. Additional advantages: the tax does not disturb prices, nor discourage the building of homes; but principally, that it interests all citizens, particularly the professional classes who keep aloof from politics, in civic affairs.

The tax is not equitable, since in 1869 seven states of the union with 40 per cent of the total population paid 75 per cent of the tax. According to the law of 1894 less than 2 per cent of the taxable inhabitants would have been compelled to pay more than 95 per cent of the entire tax. Apropos of this fact, Senator

**Dis-
advantages** Edmunds exclaimed with fine scorn: "And this we call a free government—a government of equal protection of the laws!" If one man is taxed more heavily than others, he should have a proportionate representation, as is done in Prussia. Grant the convenience of payment and the certainty, altho that is no more the case with the income tax than with any other, but how about the economy? If self-assessed, many people will avoid the tax. If assessed by collectors, people will perjure themselves rather than pay. In either case, the State will lose money. In 1869 only 259,388 persons out of 37,000,000 acknowledged an income of \$1,000. In 1870 two maiden ladies in a New York village paid more income taxes than all the men in a large city near by. Commentary not necessary. A tax that makes perjurers of its citizens is certainly neither equitable, convenient, certain, nor economical. The income tax is, in fact, fallacious in its theory as a mode of encouraging a more equal distribution of wealth; it is unjust and impolitic in its discrimination against a small class; it is corruptive and inquisitorial in its practise; it will not interest any more people in civic affairs, since Germany with this tax has about 3,000,000 inactive voters whom only the Socialist specter was able to bring to the booth in Jan., 1907.

What is the truth? Theoretically, the income tax is most just and equitable, but it is most difficult to apply in practise; especially in a democracy where the doctrine of non-interference prevails. The State should not lower itself by becoming a sleuth or inquisitor, nor degrade its citizens to suspected persons for the sake of levy-

ing an unwelcome tax. If all citizens were honest, the tax would certainly be as easy in practise as it is just in theory.

RUDOLPH M. BINDER.

INDEPENDENT LABOR PARTY, THE (ENGLISH): Popularly called the I. L. P.; this party is the outgrowth of the agitation in the United Kingdom for an independent political party to voice the demands of labor. In 1888 there was established a Scotch Labor Party. (See SCOTLAND.) In Jan., 1893, a conference of 115 persons was held at Bradford, England, and the Independent Labor Party organized, largely through the efforts of J. Keir Hardie. Tho not using the term Socialist in its name, it was distinctly socialistic, its constitution, as amended in 1894, declaring its object to be "the collective ownership and control of the means of production, distribution, and exchange."

At present its objects and methods are thus stated:

Object.—An industrial commonwealth founded upon the socialization of land and capital.

Methods.—The education of the community in the principles of socialism. The industrial and political organization of the workers. The independent representation of Socialist principles on all elective bodies.

In 1895 the party with twenty-eight candidates polled a total of 44,321 votes, tho no candidate was returned. In 1900 (the next general election) the party officially contested only 10 seats, and polled 37,209 votes, on a clear Socialist and anti-war platform. Only one candidate was elected, J. Keir Hardie, at Merthyr, with 5,745 votes. In 1906 the party worked practically as a part of the Labor Representation Committee (q. v.) (now the Labor Party), but nominated itself ten candidates and elected seven, while a number of the Labor members are also members of the Independent Labor Party. (See LABOR PARTY.)

About 65,000 meetings are now held per annum under the auspices of branches of the party, and in many towns, in addition to the indoor and outdoor meetings, the branches maintain a literature stall in the market place, where propaganda publications are on sale. The party published in 1906 eighteen new pamphlets and over half a million leaflets.

The party has also been very active in local elections, and has now some 900 members on various local bodies. There are at present some 700 branches with 40,000 members. It has a weekly organ, *The Labor Leader*, edited by J. Bruce Glasier, formerly by J. Keir Hardie. In Feb., 1906, Mr. Hardie was chosen leader of the Parliamentary Labor Party.

A recent manifesto of the party address to the working classes says:

We desire it to be plainly understood that the fault of this lies at the door of you, the working classes. Hitherto you have been content to leave your political thinking to be done for you by party politicians, and your opinions to be formed for you by their hirelings in the press. The main reason for the existence of Liberals and Conservatives is to protect the interests of the rich, and keep you divided. This they accomplish by keeping you wrangling over matters which concern you but slightly, if at all. They appeal to your religious prejudices, your racial animosities, your patriotism, and your pride; and while you quarrel among yourselves they quietly fill their own pockets and empty yours.

The chairman of the party is J. Ramsay MacDonald, M. P.; the secretary, Francis Johnson. Address: 23 Bride Lane, Fleet Street, London, E. C., Eng.

INDIA: Social reform in modern India dates from Raja Ram Mohun Roy (born 1774—died 1833), who founded the Brahmo-Somaj and was the most important advocate of the abolition of *suttee* or the self-immolation of Hindu widows on the funeral pyres of their dead husbands. The next great reformer was also a Bengali, Iswar Chandra Vidyasagar (1820–1891), who took up the subject of enforced widowhood among the Hindus. As girls among the higher castes were married before they attained puberty it often happened that girls whose marriages had not been consummated had to remain widows, and unmarried all their lives, remarriage being strictly prohibited. The third great reformer was Keshab Chandra Sen, the well-known leader of the Brahmo-Somaj. Since the days of Keshab Chandra Sen, social reform in Bengal has been chiefly confined to the Brahmos whose ladies are well educated and do not observe *purdah*, or seclusion behind a screen so as not to be seen by men. The movement spread to other parts of India. In Bombay, Karsondas Kulji, Madhavdas Raghonathdas, and Vishnu Sastri took up the question of the remarriage of widows in earnest.

Leaders Under Dr. Bhandarkar and Mr. Justice Ranade social reform attained wider scope. The question of reforming the marriage system was agitated and attention was forcibly drawn to the custom of infant marriages as a source of much evil. To these two gentlemen and to the present General Secretary of the National Social Conference, the Hon. Mr. Justice Chandravarkar, it is due that the movement has developed a comprehensive program of national efficiency.

In Madras, Dewan Bahadur Raghoonath Rao and Rao Bahadur K. Veerasalingam Pantulu have worked strenuously for the removal of the restrictions upon widow marriage and for social reform generally. In the Punjab, the great movement associated with the name of Dayanand Saraswati has greatly helped the cause of social progress. Rao Bahadur Waman Rao Kolhatkar in the Central Provinces, Prof. K. D. Karve in Poona, Mr. B. N. Bhajekar in Bombay, Rao Bahadur Lal Shanker Umiashanker and Mr. and Mrs. Ramanbhai Mahipatram Nilkant in Ahmedabad, and Bala Bakthwar Singh in Shajahanpur deserve mention for their active labors in the cause.

The chief gathering of the social-reform movement is the National Social Conference which meets every year in the same place as the National Congress. It is a federation of Social Reform Associations scattered all over the country, the principal of these being those of Bombay, Ahmedabad, Poona, Madras, Rajahmundry, Guntur, Bangalore, Mysore, Allahabad, Shajahanpur, Lahore, and Calcutta. There are numerous smaller associations in the districts. The Social Conference offers a common platform for all reformers irrespective of caste or creed.

**Reforms
Advocated** The reforms on the program of the Conference and the affiliated associations relate to the education of women and the elevation of their position by improvements in marriage and other social institutions; the removal of useless restraints

on individual freedom such as the prohibition of sea voyages and intermarriages among the higher castes; and the amelioration of the condition of the lower classes by removing the disabilities of caste. Social purity and efficiency are the aims of all these reforms.

The annual National Social Conference was instituted twenty years ago and is annually increasing in power, tho its followers are relatively few and are all among the educated.

The most striking advance witnessed in the last two conferences was the inauguration of women's meetings in connection with these. It is, indeed, a new thing under the sun, and a very significant thing, that Hindu women themselves are willing and able to conduct public meetings and present strong papers on various subjects connected with their own social disabilities. The battle is half won when the women themselves come to urge their own cause; for the women of India are generally the most conservative members of the community and only ask to be left alone in their bondage.

Another fact connected with social reform in India is the almost total absence of the 60,000,000 Mohammedans from the movement. This is chiefly because the problems thus far approached and urged are Hindu problems, arising within and by the Hindu faith only.

The Indian Social Reformer, in Bombay, *The Indian Messenger*, in Calcutta, *The Arya*, in Lahore, *The Voice of Truth* and *The Carlylean*, in Rajahmundry, are the leading English newspapers devoted to the subject of social reform. There are numerous vernacular papers and the more advanced political organs of the people are generally on the side of social reform.

The Indian Social Reformer, under the guidance of Mr. Natarajan, is worthy of all praise. It is thoroughly bright and able and is characterized by moral vigor and deep convictions. Its ruling motto, published on the front page, is W. Lloyd Garrison's trenchant remark—"I will be as harsh as truth, and as uncompromising as justice; I am in earnest—I will not equivocate—I will not excuse, I will not retreat a single inch—and I will be heard." It is written in elegant English, is reasonable, yet uncompromising, in spirit and inspiring in its treatment of all subjects.

Perhaps the best method of indicating the scope and of suggesting the limitations of social reform in India will be to mention the principal questions which have been raised and upon which resolutions have been carried in the All-India Annual Social Reform Conferences. This statement will also indicate the unique and very backward condition of India in matters social.

I. The Disabilities of Women: This really constitutes the greatest and, at the same time, the most debasing social evil of India. Woman from time immemorial has been crushed by the Hindu system; her rights have been denied and her social liberties ignored.

Efforts for the amelioration of her condition have been made on several lines:

(1) The prevention of infant marriage. Millions of girls, between infancy and puberty, have been actually married and their destiny practically sealed not only without their consent, but also with the probability of their becoming widows, even during childhood. In view of the great difficulty of preventing this evil entirely, compromise has been sought by trying to secure the enactment of a law to prevent such marriages

before a girl reaches ten years of age. Even this has not been achieved save in the native state of Mysore where such a law was recently enacted.

(2) A vigorous effort has been made to prove from the Hindu Shastras that infant marriage is really only a betrothal, and that therefore, on the death of the young man before the consummation of the union, the girl should not be regarded as a widow. Therefore it is urged that virgin-widows, so called, should not be prevented from marrying after attaining puberty. But reformers have not yet succeeded in carrying this point with the people; so that the remarriage of infant widows is a matter of very rare occurrence.

(3) Effort has also been made to further the education of women. In a land where only six women in a thousand can read or write, and where only a few think that woman is worthy of an education, or can be improved by it, the reformer has thus far not been able to accomplish much. And yet, by annually emphasizing this matter an improvement is noticeable and a desire is being created among the people for an education for their girls.

(4) Such matters as marriage expenses and the marrying of little girls to old men have more than once received the attention of the conference. In view of the terrible poverty of the people, the iron-bound custom which insists upon a man spending, often, even a year's salary in the marriage of a son or a daughter would seem absurd if it were not so tragic. The people themselves have no option in the matter. To lavishly feast a host of relatives and to furnish all sorts of vain display is the demand of a tyrannizing custom.

(5) Much has been done with a view to preventing girls from being dedicated by their parents to Temple Worship, which means to prostitution. The nautch-girl is the bane of India. Without any will of her own she has been dedicated to this life and is the most sinned against among the women of the land. And having grown up to womanhood she not only degrades the religious worship of the people but also becomes a curse in the social system of India. No Hindu entertainment is considered complete without her presence and brazen performances. During the last twenty years reformers have striven hard to discourage nautch-girl performances by rendering them unsavory in the eyes of Europeans. Not a little success has attended their efforts in this line.

II. The Joint Family System: This hoary system has been attacked by reformers with increasing vehemence. For three generations members of a family live together and have all property and interests in common. The joint earnings of the family are its joint possession. Recently a "Gains of Learning Bill" was passed through the Madras Legislature (it has not been enacted as a law) whereby every member of a family might claim individual possession of that part of the family property which was acquired by his own industry. Increasing dissatisfaction is felt with the old system and reformers are fighting it chiefly because of its injustice and of the encouragement which it gives to indolence among the members of a family.

III. Caste Reform: This constitutes the battle-cry of the reformers. As the Hindu caste system is the greatest curse of India and brings within its mighty grip nearly the whole social system, so it becomes one of the chief points of attack.

One of the most beautiful acts of renunciation ever performed in India was that of the veteran

reformer and philanthropist, Rao Bahadur Vee-rasalingam Pantulu, early in 1906 in Madras. Tho a Brahman of high distinction he felt so strongly the bitter curse of caste throughout the land, that, in public, he took off his Brahmanical thread and forever severed himself from this stupendous system of evil. But the ambitions of ordinary reformers do not seem at present very high. They seek in their conferences two alleviations—one in the form of permission for intermarriage among kindred and closely connected castes; and also the right to interdine at least among men of kindred castes. And it is encouraging to know that, while intermarriage is making very slow progress, interdining among the educated is becoming less and less uncommon.

IV. The Elevation of the Pariah: More than once has this been a subject of reform activity. In the whole Hindu system there is no room for the Pariah, either religiously or socially. In every sense of the word he is an outcast. Nor has the ordinary high-caste Hindu any place in his sympathy for the Pariah. Reformers, however, are sensible not only of the cruelty but also of the stupendous folly of such a system. The Pariah is one of the most useful members of society in India; and to treat him worse than a brute is as unwise as it is unkind. Reformers see also that it is impolitic to drive the Pariah out of Hinduism into Christianity. They therefore demand consideration and charity to the poor outcast. But, so far, their advocacy has brought little relief to the Pariah. He is still the despised and the rejected among men.

V. Temperance: This is one of the subjects advocated by reformers. Intemperance is not a great evil in India to-day. But it is a growing evil. This accursed habit which holds many Englishmen in thralldom is increasingly finding way and power among those who come daily into contact with the English. Thousands of such—and among them many of the noblest sons of India—are becoming slaves to the drink habit. So that the cry of temperance reform is one of increasing importance and urgency.

VI. Advocacy of foreign travel is often heard on reform platforms. An orthodox Hindu has no right to leave his native country. The crossing of an ocean is a sin of the deepest dye; and Hinduism pronounces its ban upon every one who dares to cross the ocean, even for the best purposes. Reformers are raising their voice against the folly of such religious prohibitions and are demanding relaxation in the rules of their faith whereby men may go for training and for their highest development to other countries. So far most men who have defied their religion and have gone abroad have been outcast upon their return. But they have been readmitted, most of them, upon the rendering of an "atonement" which is both disgusting and extremely humiliating. Reformers are demanding that men shall enjoy in Hinduism the right of travel and of intercourse with other people. In this they are more progressive than consistent; yet through their efforts concessions are being slowly made to foreign-traveled men.

VII. Religious Education: Resolutions have been passed in favor of a religious education in public schools. These men feel that a strictly secular non-religious and godless education is a very mixed blessing in this land. In India means of religious training are very few. Hinduism never undertakes to impart its teachings and its spirit-

ual blessings to its youth. In like manner government schools and all Hindu institutions entirely ignore even the fundamental truths of religion. Reformers feel that such an education is fraught with evil to the land; and they have urged, time and again, that the government undertake this very difficult task of framing a scheme of religious training for the scholars, even though they come from the many faiths of India.

VIII. Charity: A cry has been raised by social reformers against the indiscriminate charity of India. Truly in this land "Charity is blind." Every religious mendicant, however sleek and corrupt he may be, must be fed. And there are 5,500,000 of such at present in India. There is a no more charitable soul upon the earth than the Hindu; nor is there a more indiscriminate giver. And he gives largely with the semiselfish purpose of acquiring merit and blessing in the world to come. There is here no such thing as organized charity. The reform movement has therefore sought to call attention to the evils caused by this bad method of doing a good thing.

IX. Readmission of Proselytes: One resolution has been passed urging upon Hindus the importance of opening a way by which converts to Christianity and other faiths may be readmitted into their ancestral religion, should they desire it. It has often been said that Hinduism has many doors of exit, but only one—that is, through birth—of entrance. A man who has left his ancestral faith of Hinduism and has abandoned its outward bond of caste, cannot, according to the Hindu Shastras, find a way of return, should he ever desire it. The Zoroastrian religion of the Parsees in Bombay went further than this and maintained recently that no one not born in the faith could by any possibility enter it. Reformers have carried their conflict into the heart of Hinduism and are demanding that men who have repented of their desertion of their religion might still find "room for repentance."

The most striking thing about the foregoing list of subjects which has received the attention and prompted the energy of the Indian social reformer is the strange way in which religious and social matters are mixed in a platform of action. Subjects which, in the West, strictly belong to the domain of religion are here in India a part of the social reformer's program. And matters which the Westerner regards as purely social are emphatically under the control of faith in this land.

This is natural enough; for India has never distinguished between the social and the religious. Religion has claimed for herself the right to control the whole of human life, individual and corporate. The mighty caste system has welded together the two hemispheres of human life and interests and brought them under the centralized control of faith. Society, in all its departments, is dominated by caste. Every act of human life, from the cradle to the burning-ground, is strictly prescribed according to caste rules. And caste, in its turn, is the chief agent of an all-controlling Hinduism. And it enforces all its behests through threats of religious penalties. Hinduism and caste are convertible terms.

Thus the reformer, no matter what evil he may attack, finds it entrenched behind the religious permissions or exactions of the country. So that in three fourths of all his social-reform efforts he runs full tilt against the religious institutions of the land.

It is just here that the Indian social reformer finds his greatest limitations and his chief discouragement. Upon all sides he finds hoisted the red flag of danger, and he is commanded to "keep hands off" institutions established and fostered by his own ancestral faith.

In connection with this there has recently arisen another hindrance to reform. This has developed within the ranks of social reformers themselves. The more timid and conservative among them have become fearful lest the more daring should drag them into hostility to, and bring them under the penalty of, their old religion. Therefore they raise a protest against the radical spirit and against methods which seem subversive of their faith. These timid ones have therefore organized themselves into "The Party of Progress," and delight in abusing their erstwhile companions in service.

These "Progressists" claim that progress is better than reform, and that efforts for the social advancement of the people should be *evolutionary* rather than *revolutionary*. They

The "Progressists"

would move along lines of least resistance and, in all their efforts for reform, they would try their utmost to keep on friendly terms with the faith of their fathers and disturb the institutions of the past as little as possible. They have taken upon themselves the contract, with *Bottom*, "to roar as gently as cooing doves"! Under existing circumstances in this land the attitude of this party is cowardly in the extreme and will do much more than pronounced reactionaries can possibly do to retard the cause of reform. It is, indeed, one of the most subtle and sinister blows that has been struck at reform in this land of late years, and will do much to embarrass the movements of that now diminished party of faithful men who are trying to raise their country from the bondage and curse of the past.

It may be said that even among the best reformers in India the great need is for men of stern conviction and unbending loyalty to the cause they advocate. The ordinary reformer of India is a man vehement in public words, but shockingly tame in his private acts. Upon the platform he will thunder like a Webster, but in his private and domestic life he is, too often, the abject slave of customs which he publicly denounces, and the obedient servant of the grandmothers of his household.

To a Westerner the most radical reform that is sought in India to-day will seem absurdly inadequate to the demands of modern times. And to him the Hindu reformer seems the most unambitious and the most timid of mortals. But to one who well knows the immobility of the East and the spirit with which it resents every change, the reformers of India are men worthy of admiration, sympathy, and pity. For the social reformer of India is always in danger of being wrecked either on the Scylla of conservative Hindu hostility, or on the Charybdis of Western contempt.

Recently social reform has suffered another setback through the New Patriotism which has pervaded the land. This Nationalism is a very recent ebullition and has been very much strengthened through the great success of the Japanese. In Bengal it was kindled into a blazing fire through Lord Curzon's "Partition of Bengal" scheme. The Bengali Babus resented this act and organized themselves into a *Swadeshi* ("Home Country") movement under the watch-

word *Bande Mataram*. Its object has been in the main a good one—to encourage home industry and to oppose the sale of all foreign merchandise. But, unfortunately, the movement has also created, and fostered, a great deal of race animosity. It has, moreover, exalted unto heaven everything Eastern, because it is of the Orient, and has striven to create ill feeling against all that is of the West. This has not been confined to matters industrial and commercial. It has led also to a reactionary spirit in matters social, political, and religious. It is not likely to continue long; but it is a passing fad which has done much, and is still doing not a little, to turn the faces of the people against progress and reform. For, however much the reform movement may be in the hands of natives, the people are wont to associate the movement with Westerners and Western ideas; and consequently it is a thing not largely in favor at present.

There is, however, no land upon earth where protection of home industries is more imperatively and urgently needed than in India. The natural resources of the country are great. Sir Guilford L. Molesworth, in his presidential address, tells us that

India possesses enormous natural wealth and resources, agricultural, mineral, or industrial, but they are to a great extent undeveloped. Her coal-fields, so far as they have been explored, cover an area of 35,000 sq. m., and are estimated to contain 20,000,000,000 tons of coal! Some of the seams are 70 feet to 100 feet thick. In Bengal and Assam there is coal nearly equal in evaporative power to medium Welsh steam-coal, though inferior to Aberdeen. In some parts of India the supply of iron ore is on a scale of extraordinary and unparalleled magnitude, whole hills and ranges of it being of the purest varieties. There is chrome-iron capable of making the finest Damascus blades, manganiferous ore, magnetite, splendid hematites in profusion, peat, petroleum, gold, silver, aluminum, lead, tin, copper, plumbago, lime, magnesia, mica, gypsum, salt, soda, and asbestos. There are immense forests of valuable timber. There are food grains of every description, soft wheat equal to the finest Australian, hard wheat rivaling the best Kabanka, oil-seeds, rubber, tobacco, tea, coffee, cocoa, sugar, spices, dyes, cotton, jute, hemp, flax, coir, and fibers of every description—in fact, products too numerous to mention.

The great problem of India is how best and most speedily to develop these immense resources. The two chief obstacles to this are a lack of mutual confidence among the people and the well-organized competition of England. Hindus do not repose confidence in each other, so that joint stock companies are very rare. And even the few that exist are not a financial success. In a land which is doomed to be an "open door" of trade the industrial well-being must inevitably depend upon financial organization and a pooling of the interests of business men into large companies which can successfully compete with rival foreign industries. But the persistent unwillingness of native money to flow into Indian joint stock companies is, at the same time, a prime obstacle to Indian industries, and a frequent commentary upon Hindu character.

Moreover, India is confronted by the impossibility of these small unprotected industries competing with the mighty industrial rivals of the West.

Herein lies the unvarnished tale of India's miserable industrial condition. And yet there is hope; for increasing effort is being made and growing success attends the endeavor of the government and the people to resuscitate defunct industries, and to establish new ones. The recent growth of the cotton industry is a testimony to this; for 175 large cotton mills (the product of the last few years) are now running in this land.

At the same time the people are growing increasingly convinced that home industries can thrive only under theegis of a protective system. And as this government dare not rouse opposition in England by instituting such a system, the people feel that it is time for them to do something in their own way. Hence the home protection of *Swadeshim*. Unless the movement is wrecked on political rocks it will thrive for a while and do much to revive home trades that are languishing. On the other hand the folly of boycotting foreign articles when home institutions cannot, even under the most favorable circumstances, supply a tithe of the market, is apparent. In the wildness of their enthusiasm they now ban foreign articles such as are not and cannot at all be manufactured in this country. The cry of self-denial and of a return to the "simple life" will not avail, as Indian taste for many foreign things has become a passion which must be satisfied at all costs.

However much this movement may ultimately fail of its great purpose, it certainly is doing and will do much to encourage and develop Indian industries, than which there is hardly anything more needed in the land to-day.

There is a brighter future in store for social reform in India. The growing intelligence and the increasing love of freedom and individual liberty which is taking possession of the minds of the people, will eventually reassert itself. Then, with ever-increasing power, reform will triumph over progress and the ideas consonant with modern thought and life will overthrow the unrighteous and worn-out customs of the past and will bring full life and liberty to the people everywhere.

J. P. JONES,

PASUMALAI, INDIA.

STATISTICAL INFORMATION.

The total area of India, including native states, is 1,766,597 sq. m. (3/4 of the habitable globe), and the population (1901) 294,361,057 (about 3/4 of the world's population). Chief cities: Calcutta, 1,125,400; Bombay, 776,006; Madras, 509,346; Hyderabad, 448,466; Lucknow, 264,049; Rangoon, 234,881; Delhi, 208,573; Benares, 209,331. In India about 207,000,000 are Hindus, 62,500,000 Mohammedans, 9,500,000 Buddhists (chiefly in Burma), 2,923,349 Christians (chiefly in Madras), 94,000 Parsees.

Acquired by the East India Company (beginning in 1757) India in 1858, after the mutiny of the Sepoys, was transferred to Great Britain and in 1877 was made an empire. It is governed by a viceroy, with a council mainly English tho some are always natives. The viceroy is appointed by the crown usually for five years. There is also in London a Secretary of State for India, only nominally responsible to Parliament. His salary is not

Government according to the British estimates and therefore his actions do not come under the attention of the House of Commons. The council is composed of eight members, appointed by the crown, and sixteen others, nominated by the governor-general. The two presidencies of Madras and Bombay are administered by governors, appointed by the crown, and the provinces by lieutenant-governors, appointed by the viceroy. There are in India 250 districts under deputy commissioners, and 764 municipal bodies, whose members are partly elected, partly appointed. Administration is conducted by appointees who have passed its civil-service examinations in England, natives of the civil service in India, military officers in civil employ, and other civil servants of different grades, European or native. The present viceroy is Earl Minto, Lord Curzon having resigned Aug. 12, 1905. The Secretary for India, appointed 1905, is John Morley.

There is also an Indian National Congress (begun in 1885), where Hindus of all races, religions, and provinces can meet and discuss their needs. President, Hon. Gopal Krishna Gokhale.

Lord Curzon was called by some "The Great Viceroy." During his seven years' office he added a new department of Commerce and Industry to the government, converted annual deficits into surpluses in the revenue, reduced taxes (especially the odious salt tax) and postal and telegraphic charges, created an imperial cadet corps, purified the police service, improved the railway service, developed the wonderful irrigation system, resisted the proposal of the home government

to saddle India with South African and other war expenses, organized more fully and thoroughly the educational and university system, almost eliminated frontier raids and wars, rendered innocuous Tibet and the Persian Gulf, and added mightily to the prestige of the Indian Government. Nevertheless, the government is much criticized. The Extreme Party, led by Mr. Tylak and Bepin Chandra Pal, have come to the conclusion that reform is only to be obtained by direct conflict with the British authority.

It is claimed principally: (1) That Indian exports exceed by roundly £50,000,000 her imports, the balance of trade against India all going into English pockets in gold payments made in England on account of pensions, private remittances, establishment, interest on loans raised in England to meet unnecessary and unproductive expenditure in India, such as the cost of foreign wars, strategic railways, and the like.

The Opposition

(2) That though India is a very poor agricultural continent, subject to devastating famines, and has consequently urgent need for home industries, the aim, or at least the effect, of England's commercial policy from first to last has been to destroy her few industries and prevent the establishment of new manufactures, which may interfere with our trade. In furtherance of this policy it is instanced that England deliberately killed India's silk industry, and later attempted to ruin her struggling cotton factories by forcing the government of India to repeal the cotton duties.

(3) That to find money to pay the "tribute," and meet the expenses of India's unnecessarily costly system of government, England exacts, under the name of land revenue, from the poverty-stricken cultivators in a rigid and harsh manner the estimated equivalent in rupees of from 33 per cent of the gross produce of the land to half the estimated rental, or, say, 50 per cent of the produce.

(4) That contrary to the queen's proclamation of 1858, and to solemn pledges made from time to time, England practically excludes fully qualified Indians from all good administrative posts, reserving them for Englishmen.

These charges are denied by the government and considered at least as exaggerations by most Englishmen.

Nevertheless, every day that the government delays to meet their wishes, the opposition carries over into the camp of the extremists an additional number of men who are really concerned for the welfare of the country. Men like Mr. Gokhale, whom Lord Curzon described as the ablest man in India, believing that in the last few years the clock of progress and liberty has actually been put back by the government, are becoming more and more dissatisfied. Mr. Gokhale sees that British rule has produced disastrous economic results, and while these great evils might be borne as a necessity of a state of transit, they are absolutely impossible if the bureaucracy attempts to make them permanent.

The revenue of India (1904-5) was £84,699,000. Expenditures, £81,213,000. Public debt, £81,529,000 in India, and £12,887,000 in England.

The army is under a commander-in-chief (Lord Kitchener), directly responsible to the governor-general in council. Officers and men, regular and reserve, 324,650, of whom more than half are Indians.

The exports (1904-5) were £116,002,000. Imports, £95,948,000. Of the exports 27.5 per cent go to the United Kingdom and 28.5 per cent to Europe. Of the imports, 63.2 per cent come from the United Kingdom. There is a general duty of 5 per cent, except on railway material, agricultural and industrial machinery, food, grains, and some raw material. Cotton goods pay 3 1/2 per cent, iron and steel 1 per cent. The chief exports are wheat, rice, jute, cotton, hides, opium, indigo, tea.

India is mainly agricultural. The principal crops are rice, wheat, millet, pulse, oil-seeds, tea, cotton, sugar, tobacco. Opium is a government monopoly mainly restricted to Bengal. There are 15,756,000 acres under cotton. Land is held under two tenures, the *Zamindari* tenure, where the land is held in large estates, by zamindars and village communities, and the State revenue is assessed and paid as a whole for stated periods, and the *Rajwari* system, of petty proprietors. About 318,000,000 acres are under the former and 278,000,000 under the latter system. The land revenue (1903-4) was £19,334,388.

Education is increasing. There were in 1906 five universities with 194 affiliated colleges; 5,741 secondary schools with 662,287 scholars; 105,735 primary schools with 3,513,156 pupils; including private schools there are 4,883,000 scholars, of whom 513,300 are girls.

The masses of the people are very poor. The average annual income of the people is about 24 rupees, equal to some \$8. Multitudes have only from 6 to 12 rupees per year.

One sixth of the people, 40,000,000, go through life on insufficient food (Sir W. Hunter in "England's Work in India"). Failure of food means famine. There have been seventeen famines in the last 123 years. In 1900, 417,000 sq. m. (one quarter of the empire) were affected, with 54,000,000 persons; 5,607,000 received government aid, 15 per cent of the entire population, and in some sections 30 per cent. One cause is lack of transportation, there being enough food in India for all. Overpopulation is another

cause. Ruinous marriage and funeral expenses are another. Caste prevents one class from feeling for another.

Hindus call India "The Land of Charity," foreigners add "of beggars." The laws of Manu make it the Brahman's duty to beg. There is no poor law. Charity is all private. The government, in time of famine, supplies relief works. In all the principal cities and mission stations Europeans have established friend-in-need societies or charity boards. There are forty-eight houses for opium refugees. The Lady Dufferin Association (1885) had 133 hospitals and dispensaries, 74 lady doctors, 52 assistants and 257 medical students. There are probably 500,000 lepers in India; and there are now 47 leper asylums. The largest has 545 inmates. There are 9 asylums and schools for the blind and deaf-mutes, and 23 for the insane; 115 orphanages and 7 juvenile reformatories. The government is developing great schemes of irrigation, commerce, and industry. It is introducing agricultural banks and postal savings-banks.

INDIVIDUALISM: The term *individualism*, as used in social science, has been defined as "the theory of government which favors the non-interference of the State in the affairs of individuals." ("Century Dictionary"). It is, however, more commonly, and much more correctly, used for the tendency to oppose State interference in the affairs of the individual rather than for any cut-and-dried theory of the function or lack of function of the State. When a man says he is an *individualist*, he usually means not that he holds any exact *a priori* theory as to what the State should or should not do, but that he inclines to oppose State interference, unless it be very clearly proved that it is necessary. The presumption

Definition

with him is against interference. He inclines to resist socialistic legislation, even in small matters, lest they lead to a general State socialism. He believes that we must finally decide from experience and history what in each particular case is wise. Individualism must not be confounded with anarchism (*q. v.*), nor with the positive program laid down by particular individualists, however prominent. (See SINGLE TAX; SPENCER; VOLUNTARISM.)

We find individualism somewhat developed among the Greek Sophists and in all Greek thought. Greek political philosophy conceived, it is true, of the individual as living for the State rather than for himself; but with this went a high conception of the complete man, the sound mind in a sound body, and this developed a practical, ethical, if not a political individualism. Aristotle, with his tendency to exalt the concrete over Platonic abstractions, may be said to be the first great thinker of individualism, tho even he held the high Greek conception of the State. The Cyrenaic and the Epicurean schools both developed a type of ethical individualism. Still more did Stoicism lend itself consistently to individualism. Some of the profoundest thoughts of ethical individualism have come down from the Greek Stoics, while some of its noblest and most classic utterances must be sought in the pages of the Roman Stoics.

The Roman Empire, it is true, developed into a strong imperialism; nevertheless, in Roman thought, and above all in Roman jurisprudence, the individual is in a large sense supreme over the State, since we have here the first clear development of the theory of contract between free individuals. Meanwhile, the life and teachings of

Christ were developing, many hold, an individualism flowering into fraternal charity rather than the primitive Christian communism, of which so much is said to-day. (For a discussion of this, see CHRIST AND SOCIAL REFORM; CHRISTIANITY AND SOCIAL REFORM.) Be this as it may, the Middle Ages, inheriting the traditions of Roman power, together with the religious teachings of Christ, developed an ecclesiastical paternalism removed alike from a primitive communism or an ethical individualism. Nevertheless, in some of

Modern Individualism

the schoolmen we trace an individualist thought based in part upon the teachings of Aristotle, while some of the ascetics practised what may be called a selfish individualistic spirituality. The characteristic ages of individualism, however, are those between the fifteenth and the nineteenth centuries. Revolting alike from the despotism of the Church and the tyranny of the warrior, we find the individual asserting himself everywhere, in religion and in philosophy, in political science and in practice. In religion, Luther, by the doctrine of salvation by faith, lifts the individual into the right of private judgment; while Calvin, with his doctrine of the divine decrees, by making man obedient to God alone, lifts him above obedience to any human power. From the position of Luther or Calvin it was but a step toward the practical realization of their theories by an assertion of the right of private judgment in morals and of civil liberty in matters where unity of action was not a social necessity. Kant, Bentham, John Stuart Mill, all helped people to take this step more and more fearlessly. The line of thought advanced by these men finds its legitimate development in the writings of John Morley and its exaggeration in those of W. K. Clifford.

Says Mr. Morley ("On Compromise," pp. 278-281):

We may best estimate the worth and the significance of the doctrine of liberty by considering the line of thought and observation which led to it. To begin with, it is in Mr. Mill's hands something quite different from the same doctrine as preached by the French revolutionary school; indeed, one might even call it reactionary, in respect of the French theory of a hundred years back. It reposes on no principle of abstract right, but, like the rest of its author's opinions, on principles of utility and experience. . . . Mr. Carlyle and one or two rhetorical imitators poured malediction on the many-headed populace, and with rather a pitiful impatience insisted that the only hope for men lay in their finding and obeying a strong man—a king, a hero, a dictator. How he was to be found, neither the master nor his still angrier and more impatient mimics could ever tell us.

Now Mr. Mill's doctrine laid down the main condition of finding your hero—viz., that all ways should be left open to him, because no man, nor majority of men, could possibly tell by which of these ways their deliverers were from time to time destined to present themselves. Wits have caricatured all this by asking us whether by encouraging the tares to grow, you give the wheat a better chance. This is as misleading as such metaphors usually are. The doctrine of liberty rests on a faith drawn from the observation of human progress, that tho we know wheat to be serviceable and tares to be worthless, yet there are in the great seed-plot of human nature a thousand rudimentary germs, not wheat and not tares, of whose properties we have not had a fair opportunity of assuring ourselves. If you are too eager to pluck up the tares, you are very likely to pluck up with them these untried possibilities of human excellence, and you are, moreover, very likely to injure the growing wheat as well. The demonstration of this lies in the recorded experience of mankind.

Pres. Hadley thus sums up this philosophy of individualism ("Economics," p. 14):

Constitutional liberty in politics, rational altruism in morals, and modern business methods in production and distribution of wealth have been the outcome of the great individualistic movement of the nineteenth century. The individualist has taught people not to confound public morality with a state church, public security with police activity, or public wealth

with government property. He has taught men that, as society develops, the interests of its members become more and more harmonious; in other words, that rational egoism and rational altruism tend to coincide.

But the characteristic modern development of individualism is economic. With many fore-runners, and perhaps particularly Hume, Adam Smith is here the great name, the father of the school of natural liberty, which we

Causes

do not dwell upon here only because it is treated in full elsewhere. (See **POLITICAL ECONOMY**.) Yet perhaps even here the school of natural liberty and Adam Smith are a result rather than a cause. It was necessary to break the old economic restraints. New discoveries, new inventions, new processes refused to be fettered by old laws. In France, the Revolution; in England, Adam Smith; in Germany, the Stein Hardenberg legislation; in America, the bills of rights incorporated into the national and state constitutions, all witness to and develop the same tendency to free and to protect the individual from restraint. In every country it has produced reaction—in France, the empire; in Germany, state and democratic socialism; in England, factory laws and more recently municipalism; in the United States, federalism, republicanism, and protection. Through all the first half of the nineteenth century, however, individualism was in all directions dominant. Its results are well known. The individual, free from legislative restraint, seeks gain. The producer who can produce the most, the best, or the cheapest gains the market. Out of competition to do this has

Results

sprung the modern mastery of the methods of production, division of labor, improved machinery, gigantic plants, the factory system, industry on the large scale; if it has produced the capitalist and the millionaire, it has also both lowered prices and raised wages for the million. In its search for new markets and commercial gain it has girded the world with the telegraph, continents with railroads, and whitened the sea with sails. It has developed more progress in 100 years than all the other centuries put together. If its characteristic results have been material, it has made education common. It is true that large producers and the development of colossal transportation corporations have created difficulties for the small producer, made the workman largely dependent upon the capitalist, and developed the means of production beyond the present ability to consume, causing the phenomena of the unemployed and the tramp. But it must be remembered, in the first place, that these evils are due to the very success of individualism, so that we should think twice before we attempt to cure them by destroying the system which has created this success; secondly, it is to be doubted if there are more unemployed than before, while certainly real wages, measured by prices, are materially advanced; thirdly, individualists believe that the cure lies not in forsaking the principle which has been the very life of modern progress, but in lifting up every individual to a level of more effective competition till every man receive the means of life because every man is able to contribute something to the social need. What is needed, according to this view, is not less but more individualism.

Modern practical individualism does not urge that at present we should do away with all industrial legislation or all interference of the State

with the affairs of individuals; it believes that till men grow wiser they need some legislative checks, but it holds that in general it is wiser to let the individual act as he will and seek to overcome the ills resulting from his mistakes by educating wiser and better individuals.

THE ARGUMENT FOR INDIVIDUALISM

The arguments for individualism may be conveniently divided into four heads: (1) The ethical argument; (2) the biological; (3) the inductive positive argument; (4) the inductive negative argument from the follies and evils of State interference. The ethical argument probably affects the common consciousness far more than any other. Prof. S. N. Patten, in the Introduction to his "Theory of Social Forces," considers individualism to rest largely on eighteenth-century philosophy, and says:

I question whether the hold which this social philosophy has on the popular mind can be shaken by an appeal to inductive evidence. This hold depends upon certain concepts and ideals which have received classical statements at the hands of our ablest thinkers, and which cannot be displaced by unorganized facts.

The basis of popular individualism undoubtedly lies deep down in the fundamental facts of the universe, in the power, the worth, the consciousness of responsibility in the individual soul.

The Ethical Argument

It takes ordinarily a form either religious or one of so-called natural ethics. One of the fundamental principles of Christianity is the worth of the individual soul. Protestantism, with its right of private judgment, its doctrine of salvation by faith, is particularly in accord with the individualistic tendency.

Dr. Lyman Abbott, in his "Evolution of Christianity," says:

It has been said that Jesus Christ was the first Socialist. This is certainly an inexact, if not an absolutely erroneous, statement. It would be more nearly correct to say that He was the first individualist. The Socialist assumes that the prolific cause of misery in the world is bad social organization. Christ assumed that the prolific cause of misery in the world is individual wrong-doing.

Says Mr. N. P. Gilman ("Socialism and the American Spirit," pp. 324-327):

A higher individualism is possible, and has long been actual, with at least a few of each generation of mankind. It respects every person as having something of infinite worth in him, and would begin to improve the world by elevating the single spirit, counting no advance permanent that is not based on reformed and cultivated individuals. This method fully deserves the epithet "Christian," derived from "the only soul in history who has appreciated the worth of a man." The teaching of Jesus was profoundly individualistic in its imperative address to the private conscience. Such a spiritual doctrine does not find its natural alliance with a mechanical socialism. This, with most of its exponents, is materialistic to the core. The Christian spirit is in full harmony with a rationalized individualism in social life. So inspired, individualism includes voluntary cooperation, the method of modern civilization; and the ideal to which it tends is fraternalism, not paternalism. The inquiry is extremely pertinent: "Have we yet even discovered the resources of an individualism which is not synonymous with selfishness, but welcomes and fosters public spirit?" Few wise persons will answer this in the affirmative.

This higher individualism, perhaps, quite as often to-day takes the form of so-called "natural ethics."

Mr. M. D. O'Brien, in the Introduction to his "Socialism Tested by Facts," says:

Weak and little, low and corrupt as he is, yet nature has endowed man with such a spirit that he can never permanently become the slave of men. This spirit is individualism, the deepest and mightiest fact in existence, which brings

man closest to nature herself, to his central silent home, and plants the root of his life in a substance that cannot perish. Through this spirit works the infinite, and while the heavens bend above, it can never break or fall. . . . This spirit of individualism, of non-conformity of social, political, and religious heresy is the sword which Nature forges while despots sleep; and just when they dream themselves insured in an eternity of comfortable stagnation it suddenly flashes before them, scattering their plans, circumventing their cunning, and breaking all their pet idols in pieces. This spirit opens the enslaving shell of custom, throws it aside, and allows the inner life to grow. Low slavish natures hate and fear it above everything, and no means are too bad for them to use against it; but it has always managed in the long run to undo them, and it will yet live and flourish when they and all their works are lost in the slavery of the past.

"Individualism," says Draper ("Conflict Between Religion and Science," chap. ii., p. 295), "rests on the principle that a man shall be his own master."

It is in such thoughts, of the worth of the individual, either because of its individual union with God, if the theory take a religious form, or because of the conviction that simple character, self-rule, self-reliance, self-poise, is the one thing of worth in the universe, that most men base their argument for individualism. They argue that for the State to interfere with the action of the individual weakens character. It is far better, says the individualist, for men to carve their own way, to live their own lives, to learn by experience their own lessons, even if they make continual blunders, than for the State to be interfering, even if, so far as the immediate step be concerned, it interfere wisely, because the latter course will weaken the individual will and lessen individual ability. Few individualists think that any government is wise enough to interfere wisely, but even if it were, individualists would still oppose it because of its undermining influences upon character. A wise government, they would argue, may be even worse than a foolish government. A foolish government would probably call out resistance and activity. A wise paternalism might lull to eternal sleep the power of self-choice and self-will.

The second argument for individualism is a biological one. (For a complete statement of it, see BIOLOGY; EVOLUTION.) We shall also notice it again in considering the objection to socialism. It may be said in a word to be that there can be no progress save by competition, no progress save by natural selection and the survival of the fittest, so that the struggle for life between individuals is of the very essence of progressive life, while just so far as the State inter-

feres with this struggle between individuals, and either forces or leads all men into cooperation, it must induce a low and lowering social level and the gradual degeneration of the individual. This is one of the

arguments for individualism most prevalent today. We do not dwell upon it here simply because it is considered elsewhere. (See BIOLOGY; EVOLUTION.)

The third argument, or the induction from positive experiences of individualism, may be deemed but a form of the biological argument.

It is, however, such an important form as to make it worthy of treatment by itself. It argues that the highest civilization, materially and in character, has as a matter of fact been developed when there has been

the most individualism. We have seen something of this in considering the history of individualism.

Beginning largely with Adam Smith and the so-called school of national liberty (see POLITICAL ECONOMY), we have had less interference of the State with the individual than ever before in the history of civilized man. What has been the result? There have been evils; no man claims perfection for the nineteenth century; but there has been more progress in most directions than in all the other centuries of civilization put together. In science, in the means of livelihood, in popular education, in the art of preserving life, in acquainting men with the facts of the universe, in the means of communication, man has advanced as never before in all his history. Generally speaking, perhaps, the country where individualism has been carried to the farthest degree is the United States, with Great Britain next. With what result? These two countries are to-day the wealthiest, the strongest, the most vital countries of the world. The language and the commerce of these two nations are dominating the world. Particularly has the U. S. stood for individualism.

Says Mr. N. P. Gilman ("Socialism and the American Spirit," p. 90):

In more senses than one America may be called the paradise of the individual. No other country has held out such great prizes to private talent for the last century, or offered it a freer field to work in. A manly, capable, and self-reliant people, Americans have had an opportunity the like of which is unknown to history. . . . Least of all peoples have they had reason to put their faith in governmental machinery, even that of their own devising, in preference to individual initiative and voluntary cooperation. Especially in the building up of great manufacturing industries and the development of immense transportation systems has the practical genius of the people asserted itself, with the results in the gigantic operations and colossal fortunes which we see to-day in all directions. The American is always ready to receive help from the State in starting a railway or a steamship line (the old flag and an appropriation), but he is not at all inclined to consider the government a proper agent for the management or ownership of either.

Mr. Gilman quotes Alfred Fouillée as saying ("Education from a National Standpoint," Am. ed., p. 6): "Scarcely an American can be found who has not in his mind, in a more or less nebulous form, this idea of illimitable individualism and indefinite expansion."

Now, what has been the result? America's material wealth, her popular education, and her progress in almost all ways, are the marvel of the world. Nowhere do the common people begin to be so well off. In wages, in home comforts, in liberty, in popular education, the working people native to the U. S. are far ahead of any working classes of the world, unless it be in New Zealand and in Australia. Particularly has business in America been free from governmental restrictions, with the result that nowhere else does business begin to be carried on in so effective or colossal a way, and nowhere else are the masses of the people so well off. This last thought leads to the reflection that the very fact of the prosperity of the people is the cause of the present social unrest.

Says Herbert Spencer, in the Introduction to "A Plea for Liberty":

Of the many ways in which common-sense inferences about social affairs are flatly contradicted by events . . . one of the most curious is the way in which the more things improve, the louder become the exclamations about their badness. In the days when the people were without any political power, their subjection was rarely complained of; but after free institutions had so far advanced in England that our political arrangements were envied by continental peoples, the denunciations of aristocratic rule grew gradually stronger, until there came a great widening of the franchise, soon followed by complaints that things were going wrong for want of still

The Biological Argument

The Argument from Experience

further widening. . . . A century ago, when scarcely a man could be found who was not occasionally intoxicated, and when inability to take one or two bottles of wine brought contempt, no agitation arose against the vice of drunkenness; but now that, in the course of fifty years, the voluntary efforts of temperance societies, joined with more general causes, have produced comparative sobriety, there are vociferous demands for laws to prevent the ruinous effects of the liquor traffic. . . . And so it is, too, with the general state of the population in respect of food, clothing, shelter, and the appliances of life. Leaving out of the comparison early barbaric states, there has been a conspicuous progress from the time when most rustics lived on barley bread, rye bread, and oatmeal, down to our own time, when the consumption of white wheaten bread is universal; from the days when coarse jackets, reaching to the knees, left the legs bare, down to the present day, when laboring people, like their employers, have the whole body covered by two or more layers of clothing; from the old era of single-roomed huts without chimneys, or from the fifteenth century, when even an ordinary gentleman's house was commonly without wainscot or plaster on its walls, down to the present century, when every cottage has more rooms than one, and the houses of artisans usually have several, while all have fireplaces, chimneys, and glazed windows, accompanied mostly by paper-hangings and painted doors, there has been, I say, a conspicuous progress in the condition of the people. And this progress has been still more marked within our own time. Any one who can look back sixty years, when the amount of pauperism was far greater than now, and beggars abundant, is struck by the comparative size and finish of the new houses of operatives; by the better dress of workmen, who wear broadcloth on Sundays, and that of servant girls, who vie with their mistresses; by the higher standard of living, which leads to a great demand for the best qualities of food by working people.

Not that the evils to be remedied are small. Let no one suppose that by emphasizing the above paradox I wish to make light of the sufferings which most men have to bear. The fates of the great majority have ever been, and doubtless still are, so sad and that it is painful to think of them. Unquestionably the existing type of social organization is one which none who care for their kind can contemplate with satisfaction, and unquestionably men's activities accompanying this type are far from being admirable. . . . But it is not a question of absolute evils; it is a question of relative evils—whether the evils at present suffered are or are not less than the evils which would be suffered under another system; whether efforts for mitigation along the lines thus followed are not more likely to succeed than efforts along different lines. . . . The present social state is transitional, as past social states have been transitional. There will, I hope and believe, come a future social state, differing as much from the present as the present differs from the past, with its mailed barons and defenseless serfs. . . . My opposition to socialism results from the belief that it would stop the progress to such a higher state, and bring back a lower state. Nothing but the slow modification of human nature by the discipline of social life can produce permanently advantageous changes.

An even stronger argument for individualism is drawn from the follies and miscarriages of the wisest and best-intentioned State legislation and control. As is well known, Herbert Spencer calls the notion that evils can be readily righted by legislation the great modern political superstition. He says: "The great political superstition of the past was the divine right of kings. The great political superstition of the present is the divine right of parliaments" ("Essay on the Great Political Superstition"). He is never weary of illustrating the sins of legislators. He argues that legislators never know where the effect of their legislation will end. He says ("The Coming Slavery"):

The legislator contemplates intently the things his act will achieve, but thinks little of the remoter issues of the movement his act sets up, and still less its collateral issues. When, in war time, "food for powder" was to be provided by encouraging population—when Mr. Pitt said, "Let us make relief in cases where there are a number of children a matter of right and honor, instead of a ground for opprobrium and contempt," it was not expected that the poor-rates would be quadrupled in fifty years; that women with many bastards would be preferred as wives to modest women, because of their incomes from the parish, and that hosts of ratepayers would be pulled down into the ranks of pauperism. Even less, as I say, does the politician who plumes himself on the practicalness of his aims conceive the indirect results which will follow the direct results of his measures. Thus, to take a case connected

with one named above, it was not intended through the system of "payment by results" to do anything more than give teachers an efficient stimulus; it was not supposed that in numerous cases their health would give way under the stimulus; it was not expected that they would be led to adopt a cramming system and to put undue pressure on dull and weak children, often to their great injury; it was not foreseen that in many cases a bodily enfeeblement would be caused which no amount of grammar and geography can compensate for. The licensing of public-houses was simply for maintaining public order; those who devised it never imagined that there would result an organized interest, powerfully influencing elections in an unwholesome way. Nor did it occur to the "practical" politicians who provided a compulsory load-line for merchant vessels, that the pressure of ship-owners' interests would habitually cause the putting of the load-line at the very highest limit, and that from precedent to precedent, tending ever in the same direction, the load-line would gradually rise in the better class of ships, as from good authority I learn that it has already done. Legislators who, some forty years ago, by act of Parliament compelled railway companies to supply cheap locomotion, would have ridiculed the belief, had it been expressed, that eventually their act would punish the companies which improved the supply; and yet this was the result to companies which began to carry third-class passengers by fast trains; since a penalty to the amount of the passenger duty was inflicted on them for every third-class passenger so carried. "We must educate our masters," is the well-known saying of a Liberal who opposed the last extension of the franchise. Yes, if the education were worthy to be so called, and were relevant to the political enlightenment needed, much might be hoped from it. But knowing rules of syntax, being able to add up correctly, having geographical information and a memory stocked with the dates of kings' accessions and generals' victories, no more implies fitness to form political conclusions than acquirement of skill in drawing implies expertness in telegraphing or than ability to play cricket implies proficiency on the violin. "Surely," rejoins some one, "facility in reading opens the way to political knowledge." Doubtless; but will the way be followed? Table-talk proves that nine out of ten people read what amuses them or interests them rather than what instructs them; and that the last thing they read is something which tells them disagreeable truths or dispels groundless hopes. That popular education results in an extensive reading of publications which foster pleasant illusions rather than of those which insist on hard realities is beyond question.

In other writings, Mr. Spencer gives still more detailed instances of the ways in which State legislation works unexpected ill. He says ("Social Statics," ed. of 1851, p. 384):

An architect and surveyor describes it (the Building Act) as having worked after the following manner: In those districts of London consisting of inferior houses built in that unsubstantial fashion which the New Building Act was to mend there obtains an average rent, sufficiently remunerative to landlords whose houses were run up economically before the New Building Act passed. This existing average rent fixes the rent that must be charged in these districts for new houses of the same accommodation—that is, the same number of rooms—for the people they are built for do not appreciate the extra safety of living within walls strengthened with hoop-iron bond. Now it turns out upon trial that houses built in accordance with the present regulations, and let at this established rate, bring in nothing like a reasonable return. Builders have consequently confined themselves to erecting houses in better districts (where the possibility of a profitable competition with preexisting houses shows that those preexisting houses were tolerably substantial), and have ceased to erect dwellings for the masses, except in the suburbs where no pressing sanitary evils exist. Meanwhile, in the inferior districts above described, has resulted an increase of overcrowding—half a dozen families in a house, a score of lodgers to a room. Nay, more than this has resulted. That state of miserable dilapidation into which these abodes of the poor are allowed to fall is due to the absence of competition from new houses. Landlords do not find their tenants tempted away by the offer of better accommodation. Repairs, being unnecessary for securing the largest amount of profit, are not made. . . . In fact, for a large percentage of the very horrors which our sanitary agitators are trying to cure by law, we have to thank previous agitators of the same school!

Later, in "The Sins of Legislators," Mr. Spencer says of the building laws:

See then what legislation has done. By ill-imposed taxes, raising the prices of bricks and timber, it added to the costs of houses and prompted, for economy's sake, the use of bad materials in scanty quantities. To check the consequent production of wretched dwellings, it established regulations which, in medical fashion, dictated the quality of the commodity produced; there being no perception that by insisting on a higher quality and therefore higher price, it would limit

the demand and eventually diminish the supply. By additional local burdens, legislation has of late still further hindered the building of small houses. Finally, having, by successive measures, produced first bad houses and then a deficiency of better ones, it has at length provided for the artificially increased overflow of poor people by diminishing the house capacity which already could not contain them!

Where then lies the blame for the miseries of the East End? Against whom should be raised "the bitter cry of outcast London"?

So, too, with State supervision. Guaranteeing of quality by inspection has been shown, in the hall-marking of silver, to be superfluous, while the silver trade has been decreased by it; and in other cases it has lowered the quality by establishing a standard which it is useless to exceed; instance the case of the Cork butter market, where the higher kinds are disadvantaged in not adequately profiting by their better repute; or instance the case of herring-branding (now optional), the effect of which is to put the many inferior curers, who just reach the level of official approval, on a par with the few better ones who rise above it, and so to discourage these. But such lessons pass unlearned. Even where the failure of inspection is most glaring, no notice is taken of it; as instance the terrible catastrophe by which a train full of people was destroyed along the Tay Bridge. Countless denunciations, loud and unparaphrasing, were vented against engineer and contractor; but little, if anything, was said about the government officer from whom the bridge received State approval. So, too, with prevention of disease. It matters not that under the management or dictation of State agents some of the worst evils occur; as when the lives of eighty-seven wives and children of soldiers are sacrificed in the ship *Accrington*; or as when typhoid fever and diphtheria are diffused by a State-ordered drainage system, as in Edinburgh; or as when officially enforced sanitary appliances, ever getting out of order, increase the evils they were to decrease.

These instances of the failure of legislation, quoted by Spencer, are now somewhat classical and out of date, but they can be easily replaced by modern ones. Mr. Charles Fairfield, in his chapter on "State Socialism in the Antipodes" contained in "A Plea for Liberty," instances many failures of legislation in Australia, supposed to be in the vanguard of socialistic progress. He shows how the early-closing law in Melbourne in 1885, whereby shops could not keep open after 7 P.M., proved utterly impracticable, robbing all the small suburban stores, which did their main business in the evening, of all chance of success and creating such an opposition that the law was repealed in a few days. He argues that the conduct of the Australian State railroads has been at a heavy loss, only concealed by government book-keeping. In England herself instances of the failure of State operations can be multiplied almost indefinitely.

Says Mr. L. J. Jennings, M.P. (*Fortnightly Review*, August, 1888, p. 185):

Look, for instance, at the Admiralty and the War Office. These two departments alone cost the country £563,324 a year. The waste of labor that goes on daily is incredible. At the Admiralty the officials, sitting under the same roof, write long letters to one another on the most trivial subjects just as if they were 500 miles apart. An immense heap of correspondence may be accumulated about a stick of sealing-wax or a bit of string. The accountant-general's department, crammed with extravagantly paid officials, involves charges for the working staff of £63,557 a year, and a pension list of £32,324. . . . The Secretary of the Admiralty, Mr. Forwood, has admitted ("First Report of Sir Matthew White Ridley's Commission," Q. 9751) that if the salaries were placed on a "commercial basis" the expense of the accountant-general's office would be brought down to £35,000 or £40,000 a year. Why is it not placed on a commercial basis? It cannot be because the authorities have not had a free hand in the "game of reorganization." There have been at least five heroic operations of this kind since 1869, at tremendous cost to the country. . . . What sort of commentary is it on the great reorganization of 1878-80, which cost the country £30,000 a year in pensions and £52,199 in bonuses, that the department is now found to be filled, as the heads of it allege, with extravagantly paid or incompetent officials. . . . The War Office clerk goes leisurely to his duties at ten or eleven, and remains till four or five, his prescribed hours being six each day. And what is the nature of his work? A good deal of it is utterly thrown away. Accounts are audited and re-audited in a purely arbitrary and farcical manner. . . . Correspondence rolls on in huge volumes about trifles light as air; a charge for the use of a cab, a bill of ss. 6d. for candles, a

rent in a soldier's jacket, the loss of a nosebag (actual instances of these cases will be found in the evidence taken before the Army Estimates Committee, 1887 and 1888) may form the theme of an almost interminable number of letters. The cut in the soldier's jacket was "inquired into" by colonels, lieutenant-colonels, deputy adjutant-general, assistant deputies, and all sorts of high officials. The documents were entered into books, signed, stamped, and passed on from one to the other for nearly four weeks.

In the United States illustrations of the costliness and inefficiency of State operations are notorious. All municipal operations are full of jobs. The building of the County Court House in New York City is

The United States only an extreme instance of what goes on in all government undertakings. When designed in 1868 its cost was estimated at \$250,000. Before the end of 1871 it had cost a sum variously estimated at from \$8,000,000 to \$13,000,000, and it was still far from finished. Among the items of the cost for fitting it up were \$404,347 for safes and \$7,500 for thermometers. It is from such facts as these of the repeated failures of government activities to-day that individualists drew their negative argument against socialism. From such instances they very naturally draw the inference that if government cannot efficiently conduct the comparatively small activities it now attempts, it must still further fail in the almost infinitely more difficult functions that would be given to it under a complete socialistic régime. They further argue that even if government, surrounded and supported by individualistic methods, and with wealth created by individualism for it to tax, can, perhaps, altho clumsily and expensively, carry on the few activities of which

The Impossibility of Socialism

Socialists make so much to-day, were the government to attempt all, it would be quite another thing. Yet if the State cannot do all, the accusing of people to depend upon the State weakens the power of individuals and teaches them to lean on a reed that finally will break. To argue that government ever can conduct the complete industrial life of the people is to almost all economists and to absolutely all individualists the height of absurdity.

Mr. E. S. Robertson, in his essay on "The Impracticability of Socialism" (chap. i. in "A Plea for Liberty"), argues that, passing by the facts that Socialists very rarely go into practical details; that it is scarcely possible to see how socialism could provide the clothing for a community except by putting it into a strict uniform as in an army, since, if fashion were allowed, no national committee could foretell what would be needed—passing by the enormous problem of how to manage domestic labor under socialism, except by destroying the home, saying nothing of the still greater difficulties of just distribution between labor of different degrees of value and laborers of different degrees of ability—passing by all these and a hundred other similar difficulties, socialism utterly breaks down before the population question. He says: "The situation may be summed up in a sentence: Socialism without restraints on the increase of population would be utterly inefficient. With such restraints it would be slavery. In a word, socialism—the scheme of collective capital and collective production and distribution—breaks down the moment it is subjected to any practical test." How would the community decide, he asks, of the children born in any year—how many boys should be tailors and how many

girls dressmakers? "Socialism, disguise it as we may, is the negation of freedom." Similarly argue all individualists.

But probably the chief arguments raised to-day to show the impracticability of socialism and the necessity of individualism, are, as above stated, biologic. Mr. Kidd argues in his "Social Evolution," p. 209, that socialism has not and probably cannot make any serious attempt to deal with even the initial difficulties of the continued success of a society where the struggle for existence is eliminated. He says: "Underneath all Socialist ideals yawns the problem of population."

Mr. Herbert Spencer, in his latest work, says: "People who in their corporate capacity abolish the natural relation between merits and benefits will presently be abolished themselves. Either they will have to go through the miseries of slow decay consequent on the increase of those unfit for the business of life, or they will be overrun by some people who have not pursued the foolish policy of fostering the worst at the expense of the better." Mr. Lecky says ("Democracy and Liberty," chap. viii.): "The Socialist remedies would only bring evils far greater than any they could possibly prevent. The desire of each man to improve his circumstances, to reap the full reward of superior talent, or energy, or thrift, is the very mainspring of the production of the world. Take

Degeneration under Socialism

these motives away; persuade men that by superior work they will obtain no superior reward; cut off all the hopes that stimulate among ordinary men ambition, enterprise, invention, and self-sacrifice, and the whole level of production will rapidly and inevitably sink. . . . The essential difference of men in aptitudes, capacities, and character, are things that can never be changed, and all schemes and policies that ignore them are doomed to ultimate failure." Says Mr. Kidd ("Social Evolution"):

It will not help us, even if there are to be no competing societies, and if in the contemplated era of socialism the whole human family, without distinction of race or color, is to be included in a federation within which the competitive forces are to be suspended. We may draw such a draft on our imagination, but our common sense, which has to deal with materials as they exist, refuses to honor it. We are concerned not with an imaginary being, but with man as he exists, a creature standing with countless eons of this competition behind him, every quality of his mind and body . . . the product of this rivalry, with its meaning, and allotted place therein, and capable of finding its fullest and fittest employment only in its natural conditions.

Individualism, then, bases its argument on the fact that government can scarcely efficiently conduct even now the comparatively limited functions that it does attempt, and would utterly break down before the attempt to control the complete complex interests of all social life; that individualism, on the other hand, so far as tried during this century, while not by any means doing away with all evils, has produced more material and educational progress than in all the other centuries put together, and especially in those countries and in that country where individualism has been tried the most; that even if socialism were practicable, it would inevitably lead to the biological degeneration of the individual and of the race and finally that even the beginnings of socialism tend to undermine that self-reliance, self-rule, free self-sacrifice, which, tho men consider it born of individual communion with God or of natural ethics alone, all men are agreed to be the noblest and the only enduring and eternal quality

of man. Individualism may not produce all progress in a day; individualists are not blind to the evils of the present, but they do know that an infinite progress has been made; that that progress is now going on; that it has been and is now almost solely due to individual struggle and competition in life, and that therefore it is but simple duty to resist even the beginnings of a socialism which for an impossible mirage threatens to attack all progress and to undermine man's noblest possession, individual character and individual aspiration. It is better to let a man struggle and work his own way even slowly toward character than to lift him, were it possible, into an Utopia of physical comfort, at the cost of weakened will and increased tendency to rely on a paternal or even a fraternal organization.

THE INDIVIDUALIST PROGRAM

As asserted above, individualists are neither doctrinaires nor visionaries. Says Mr. Wordsworth Donisthorpe in "The Limits of Liberty," a chapter in "A Plea for Liberty":

It is not fair to assert or even to insinuate that individualism as a practical working doctrine in this country (England) and in the United States is based on reasoning from abstractions. . . . No one with the smallest claim to attention has been known to affirm that this or any other nation is yet ripe for the abolition of the State. . . . I suppose no one acquainted with his political writings will accuse Victor Yarros of backwardness or even of opportunism. Yet says he, "The abolition of the external State must be preceded by the decay of the nations which breathe life and vigor into that clumsy monster; in other words, it is only when the people learn to value liberty and to understand the truths of the anarchistic philosophy that the question of practically abolishing the State looms up and acquires significance."

Mr. N. P. Gilman says of American individualists ("Socialism and the American Spirit"):

The practical effort of those who here accept the name of individualist is to maintain the actual status against the strong tendency toward socialism which characterizes the time. If this can be successfully resisted they trust to gradual enlightenment to weaken gradually the power of the State. The anarchist ideal, into which extreme individualism blends, is not to be reached by crying and striving. The individualist trusts in natural and in the unforced evolution of society; he exerts himself with more or less energy simply to resist efforts contrary to this law which tend to produce an artificial development. . . . The present tendency toward socialism he would explain as a reaction toward primitive ideas which have long since, for the wiser minority, been fully exploded by experience. He stands stubbornly on the defensive against this tendency, feeling sure that, unchecked, it can only result in great evil.

Contrasting individualism with Schaffle's definition of socialism (q. v.), Mr. Gilman says concerning individualism in its practical application:

Economic individualism would then be the system of production by means of private capital (held by single persons, firms, corporations, or cooperative associations); this method of production demands a free-labor contract, open competition, and distribution to individuals. The alpha and omega of individualism is, accordingly, private and competing capitals, with a large measure of individual freedom from State control (p. 11). If we attend chiefly to the facts of the existing situation in the United States, we should then consider individualism and socialism as two opposite tendencies, moved by either of which an American citizen may advocate or attack a definite and particular measure of legislation. The Utopia of the individualist, if Mr. Herbert Spencer may speak for him, is an approach to anarchy; the Utopia of the Socialist melts into communism, but neither scheme is proposed for immediate adoption here by sensible advocates. The individualist . . . in all his degrees tends to unfavorable criticism, not to high admiration, of the manner and the results of governmental activity at present. He concedes that a nation may well tolerate a certain degree of inefficiency on the part of its officials in executing their present tasks, this being, on the whole, more endurable than the evils which would result from putting the same duties upon private persons. He opposes, however, any considerable further extension of the sphere of the State, and looks

to education of the individual mind and conscience and to general progress for relief from existing evils. The extreme individualist would not only resist the tendency to socialism, but would also retrace some steps already taken in that direction, as he would say, such as universal free education. There are very few, to be sure, in America who hold the creed with such vigor.

So conceiving of practical individualism, it is evident that there can be no fixed universal individualist program. It must be different in different countries; it is differently conceived by different individuals. On all important points the general individualist propositions will be found in this cyclopedia under each respective subject. (See LAND; INTEREST; WAGES; COMPETITION; EDUCATION; RAILROADS; POST-OFFICE; BANKING; MUTUAL BANKING, etc.)

We give here one illustration of how individualists would work out social problems. Of perhaps the most serious problem in modern life Mr. N. P. Gilman says ("Socialism and the American Spirit"):

No evil in our cities appeals more forcibly to the kind-hearted than the crowded tenement houses. . . . Every one who has a particle of philanthropy in him cries out that these evils should be made to cease from off the earth. The end is clear, but what means shall we use? The Socialist will dilate upon what Glasgow and Liverpool have done, and urge that Boston and New York at once purchase whole squares, pull down the noisome houses of to-day, and erect, instead, clean and convenient tenements, to be let at low rates. This, however, would be too much like journeying from Chicago to Minneapolis, via Paris, the Suez Canal, and Japan. The Chicagoan would thus reach Minneapolis in time, indeed, if money and patience held out. But a more direct way would be first to discover what persons are responsible as owners or lessors of these foul habitations, and then to bring home to them as individuals the distress and the crime which they occasion, while drawing profit from such inhuman conditions. Many of these persons sin as much through ignorance as through hardness of heart. . . . But if this should be of no effect, the men and women who are taught by the higher individualism that we are our brothers' keepers to a great degree can then follow the example of Mrs. Lincoln in Boston. Let them singly or in small associations buy or lease one or more city houses in the poorer districts and care for them in person or through kindly and capable agents. A large part of the tenement-house problem is manageable under this simple plan. . . . Where this plan is not expedient, the Peabody trustees in London, the Improved Dwelling-House Associations in Boston and New York, and such individuals as Mr. A. T. White in Brooklyn have demonstrated the eminent success of a more difficult method. Mr. J. A. Riis, a good authority, believes thoroughly in the compatibility of "philanthropy and 5 per cent"—the one as beginning, the other as the result. . . . The tenement-house problem in our American cities is thus fully within the control of a comparatively few persons. . . . Very few of the rich or the moderately rich in the United States would need to be converted to a higher individualism than they now practise to make the tenement-house problem a thing of the past so far as money can do it.

Such is, we believe, a fair example of the individualist program. For the far more radical proposals of such extreme individualists as the philosophical anarchist—the Spencerians, the single-tax men, the voluntarians—we refer the reader to the respective articles which treat of them. Most individualists like Professor Huxley condemn alike the dogmatism of Herbert Spencer and the theories of the Socialists. They hold, with Professor Jevons, that in social reform "the first step is to throw aside all supposed absolute rights or inflexible principles"; they would not, at present at least, destroy the State; what is shown by experience that the State can do better than the individual, that they would have the State do; but they hold that, fundamentally and eternally, all experience teaches that primary reliance must be put on industrial action; that what limits individual initiation limits freedom; that what weakens individual responsibility weakens character, and that therefore, in the words of President E. B. Andrews, of Brown University: "In

all economic activity the presumption is in favor of individual liberty and free competition."

Revised by A. T. HADLEY.

INDUSTRIAL BETTERMENT is a phrase used for the efforts undertaken by employers or firms for the benefit in any way of their employees. It varies from the model village erected for the benefit of a community to the simplest arrangement or device in the factory or store for the advantage of the employees. In this article only a few of the many forms of industrial betterment can be mentioned with a few of the firms most active in this regard. Those important instances which can be classified as model villages will be noticed under that head. (See also SOCIAL SECRETARY.)

In the United States industrial betterment is probably more wide-spread than in any other country, tho it has not gone so far as in the case of a few English firms. The leading American firm in this line is undoubtedly the National Cash Register Company, of Dayton, Ohio, where Mr. Patterson and his coworkers have developed almost every kind of industrial betterment. They

have not created a model village, **United States** mainly because it was little needed, but they have a settlement house under a social secretary, with club rooms and library. In the large dining-hall any of the 3,800 employees can get a good meal for fifteen cents. The works are light and airy, amid shrubs and grass-plots, the walls almost all glazed. For twenty-five cents a week they give a warm lunch to the girls, and for slightly more to some hundreds of men. They have bath rooms, a recreation ground with gymnastic apparatus, and rest their girls by exercises in the works. There are special gardens for boys to cultivate, schools of various grades, kindergarten and industrial, and advantages in many other ways, such as giving educational trips to develop their employees. They issue a paper and endeavor to elicit the interest of their employees by calling on them for suggestions of improvements, and by frequent lectures and meetings.

The Natural Food Company, of Niagara, the makers of Shredded Wheat, is also very progressive in this line. In a ten-acre lot they have built "a palace rather than a factory," surrounded by parks, gardens, and playgrounds. The walls seem all windows; there are roof-gardens, an elegant lecture-hall, also used for dances; fourteen bath rooms in Italian marble, free lunches for 350 girls in a spacious dining-hall, and other social features.

In H. J. Heinz & Co.'s pickle factory, in Pittsburgh, much is done for the 2,500 employees. On their works they have roof-gardens with plants and creepers; the rooms are made attractive with pictures and curios; there are admirable dining-rooms; they have a carriage which each fine day carries out some girls for a picnic, cooking and

sewing classes, an auditorium for lectures, concerts, and theatricals, seating 1,600, and other beneficial institutions.

The Waltham Watch Works, near Boston, and the Crane Paper Mills, Dalton, Mass., have handsome buildings in attractive towns. The Acme White Lead Works, at Detroit, Mich.; the Cleveland Varnish Company, the U. S. Playing Card Company, at Cincinnati; the McCormick Harvester Company, at Chicago, have beautified buildings. The Cleveland Cliffs Iron Company, in Michigan, the Plymouth Cordage Company, in Massachusetts, have beautiful grounds. The Ferris corset factory, at Newark, N. J., has flowers inside and outside the works, recreation rooms, cheap, good lunches, seaside cottages, etc. The Sherwin-Williams Paint Company, of Cleveland, does much for the health of its employees. Very many American firms have lunch rooms, rest rooms, and bath rooms for their employees. Marshall Field & Co., of Chicago, have gymnasiums, rest rooms, recreation rooms, shower-baths, on one whole floor of their department store. Mr. Carnegie's Institute, at Homestead, has library, concert-hall, gymnasium, bath, bowling-alleys. The Athenæum of the Illinois Steel Works, at Joliet (1889), was a pioneer in this line. Warner Bros., at Bridgeport, Conn.; the Celluloid Company, and Weston Electrical Instrument Company, of Newark, N. J., and other firms, have similar club-houses. Many railroads, notably the Pennsylvania Railroad, have fine Y. M. C. A. buildings for their men, while several traction companies have reading and club rooms for employees. The Cleveland Cliffs Iron Company, at Ishpeming, Mich., have fine lunch and reading-rooms for their men. The Siegel-Cooper and Wanamaker department stores, in New York, have rest rooms and social secretaries for their girls, tho the latter does not use the name. Many of the model villages, too, considered under that article, have also other features of industrial betterment. The Ludlow Manufacturing Associates have a memorial hall, with almost luxurious club rooms, library, bath, gymnasium, billiard-tables, recreation halls, etc., both for men and women. A social secretary gives all her time to looking after the interests of the employees, particularly of the women. In Mr. Nelson's cooperative village of Leclair there is a cooperative store and club-house with library, billiards, gymnasium, etc. The Colorado Fuel and Iron Company, at their different works in Colorado, have a social secretary, schools of various kinds, club-houses, libraries, recreation and reading-rooms.

In Great Britain industrial betterment has been largely connected with MODEL VILLAGES, most of these villages having indeed many kinds of industrial betterment. At BOURNEVILLE the Model Village created by George Cadbury, the public buildings include a bath-house, school-houses, a Ruskin Hall, other halls, reading-room, art-gallery, playgrounds, etc. Their works have been called a factory in a garden. In the dining-hall, tables are laid for 2,000 girls, and a fine organ plays at times during meals. Recreation grounds adjoin the works. Special courses of study are encouraged, by prizes or tuitions paid at industrial schools. Port Sunlight, built by Lever Brothers, near Birkenhead (1888), has a church, two groups of schools of various kinds, a public hall, inn, restaurant, gymnasium, public bath, fountain, cooperative stores, free

library and tennis, bowling- and quoit-grounds. There are dining-halls for men and girls, the latter seating 1,500 girls. Food is sold at very low prices, tho covering cost. The company gives excursions to the employees and introduce many other improvements.

At Earswick, near York, Mr. Rowntree employed the first social secretary in England to care for the women and girl employees. So successful has this been that the secretary has now four assistants, while a male secretary, for the men, has one assistant and two visitors. The secretaries suggest improvements, oversee the social life of the factory, and care in every way for the interests of the employees. The works themselves are made attractive, with a rose garden, flowers in the rooms, pictures, good ventilation, three or four dining-halls. They maintain cooking-schools, sewing-schools, concerts, and other advantages.

Messrs. Boden's net factory in Derby, and the Creeper lace works of Messrs. Burroughs & Wellcome, at Dartford, have gardens and lawns. The latter have a fine club building, baths, gymnasium, reading-room, spacious library (500 vols.), and encourage education in many ways. The huge carpet factory of Templeton & Co., on Glasgow Green, is faced with colored brickwork, like the Doge's palace. Jacob & Sons, at Dublin, and J. G. Graves, at Sheffield, have roof-gardens.

French industrial betterment has run largely to profit-sharing (*q. v.*, see also *BON MARCHÉ* and *LECLAIRE*) and to housing, with schools for children.

The Anzin Mining Company, near Valenciennes, has erected houses, also boys', girls' kindergarten and technical schools for its 10,000 employees. Jules Chagot & Cie., at the Blanz mines, have built 1,000 houses in four villages, and also advance money to workmen desiring to build their own houses, the cost to be paid back on instalments, without interest. They have 15 primary and 6 kindergarten schools. Harmel Brothers, with woolen mills at Warmerville, near Rheims, have 182 dwellings with allotment gardens at 1.50 to 4 francs per month. Their mills (1,000 employees) are among gardens and shrubs, with plenty of fresh air, and lighted from above. There are recreation and reading-rooms,

Other Countries

schools of all kinds, with travel for the efficient, a special chapel and vicar. M. M. Sainte, Frères, spinners, have built 2 villages at Flixecourt, with 500 houses. There are cooperative stores and schools. M. Menier, at Noisiel-sur-Seine, has 312 semidetached brick houses, dining-halls, and schools. Numerous French firms provide lunches and restaurants for their employees, as at the Bon Marché in Paris, and, still more, provide industrial schools and classes of various kinds.

The leading instances of industrial betterment in Germany are the different villages of the Krupp Steel Works (*q. v.*). They have baths in all their works, dining-halls, club-houses, with concert, recreation, and reading-rooms; schools of all kinds for boys and girls, industrial and otherwise; cooperative stores and societies; boarding-houses, savings-banks, insurance funds.

Baths are provided at the Krupp mines, the Bochum Steel Works, near Essen; the Spindlers of Cöpenick, near Berlin; the Badische Anilin and Soda Fabrik of Ludwigs-Hafen-on-Rhine; the Henkel Company of Düsseldorf; the Brandts

Great Britain

Works, at München Gladbach; and by many other firms. Various firms supply free, cheap or free lunches, notably the Krupps and the Badische Anilin and Soda Fabrik, Messrs. Spindler and Brandts. Prominent in Germany are schools of various kinds developed for employees.

In Austria industrial betterment has not gone far. At Dornbirn, in connection with Herr Hammerle's cotton-mill, a picturesque industrial village has been developed. At Smichof, near Prague, Baron Ringhofer has done much building for the 1,000 men in his machine works. He has also a sick fund and "welfare institutions."

Other countries, like Belgium, Holland, and Italy, are following in the same line.

The late Budgett Meakin, to whose book on "Model Factories and Villages" we are much indebted for information, has collected much testimony on this point. In the introduction to his book he quotes the Reeves Engine Company of New Jersey, the policy of which is to provide the best possible conditions for their men, as saying: "We can get a better grade of men who are able to do finer work and more of it by following this course." The Sherwin Williams Paint

Results

Company says: "The three most important matters for attention should be health, morals, and education, because a vigorous employee can do more work, a conscientious employee will do more conscientious work, and a more intelligent employee will do more intelligent work." Mr. Weston, of Newark, is quoted as saying: "It is interesting to note how frequently the health of employees and the requirements of business are best served by identical conditions." The Ludlow Manufacturing Associates, of Ludlow, Mass., says: "Social betterment to be successful must be free of any suspicion that it is designed to take the place of wages; second, it must not be too paternal or suggest that the recipient of its benefits does not know how to obtain them himself; third, the ideals aimed at must not be too far removed from actual conditions; fourth, as far as possible and continually more and more, the people should assume the management." Undoubtedly one of the main results is in the permanence of employees attached to a firm and their freedom from labor struggles. Especially in the case of girl employees, such betterment attracts a better grade of girls. Workrooms, light, airy, and attractive, and tastefully appointed, undoubtedly largely raise the quality of work and the tone of the workers. The entrance and halls of the Natural Food Company are like those of a first-class hotel. Flowers in factories are becoming frequent. Cleanliness has even a more direct result. Baths, especially shower-baths, and special costumes with provision when necessary against the inhaling of dust or gases, are widely used. The provision of cheap but healthy food and drink is one of the best preventives of drunkenness. Rest rooms in great factories and department stores undoubtedly aid work. Free medical attendance and care for the convalescent are provided by many employers. The provision of healthy recreation is the best guard against dissipation. Stopping monotonous and sedentary work for a little gymnastic exercise, and, above all, the provision of recreation grounds and rooms for the noon hours, are found most beneficial.

INDUSTRIAL COMMISSION: A congressional commission appointed June 18, 1898, to investigate and suggest legislation upon industrial conditions. Five senators, five representatives and nine gentlemen appointed by the president and approved by the Senate formed the commission. Investigations were conducted by nine experts, and innumerable hearings at which over 700 witnesses testified. The report of the commission, completed Feb. 19, 1902, printed in nineteen volumes and with a general index in the last volume, is the best recent summary of industrial conditions in the United States, including industrial combinations, trade-unions, labor difficulties, labor legislation, immigration, wages, taxation, etc., etc.

INDUSTRIAL INSURANCE (see also special article INDUSTRIAL INSURANCE [State] IN THE GERMAN EMPIRE; OLD-AGE PENSIONS; UNEMPLOYMENT (for insurance against); TRADE-UNION BENEFITS; RAILWAY BENEFITS; FRIENDLY SOCIETIES; FRATERNAL ORGANIZATIONS; INSURANCE; NEW ZEALAND.) Industrial insurance takes many forms. By far the most developed form of State industrial insurance is that of the German Empire, considered in an especial article, but almost all of the European governments have followed more or less Germany's example. Austria enacted a law for insurance against accidents in 1887 and against sickness in 1888. At present all classes of workers must be insured if they earn less than \$480 per year. The organization is on a territorial basis, and not by trades as in Germany. Holland, Italy, Finland, Norway have enacted similar systems since 1895. All have organized central government banks to manage the insurance, tho the first three permit insurance in private companies.

Great Britain (1898), Denmark and France (1899), Sweden (1901), and Russia (1904) make the employer peculiarly responsible for indemnities (compensations) or annuities. The employer may or may not insure his employees in private companies. This practise is on the increase in some countries, but the plan often does not work, as the employer frequently has to be sued, a process difficult or impossible for those who need it most. Belgium has developed States savings-banks and unemployment insurance on lines being widely copied in other countries. (See BELGIUM; UNEMPLOYMENT.) OLD-AGE PENSIONS are being adopted in many countries. (See especial article.) (For a general government insurance, see NEW ZEALAND.) Outside of government, the main form of industrial insurance, particularly in the United States and England, is the trade-union insurance. (See TRADE-UNION BENEFITS.) Friendly societies in England, fraternal organizations in the U. S., and similar organizations elsewhere do a very large insurance business for many of moderate means, but generally are of the middle rather than of the working classes. (See INSURANCE; FRIENDLY SOCIETIES; FRATERNAL ORGANIZATIONS.)

Very many firms in the U. S. and elsewhere, like Siegel & Cooper's (in Chicago, and later in New York), have insurance organizations for their employees. (See RAILWAY BENEFIT FUNDS.)

INDUSTRIAL INSURANCE (STATE) IN THE GERMAN EMPIRE: Social legislation for the

welfare of the working classes in Germany is constitutionally vested in the empire, and embraces working men's insurance and working men's protection. Both supplement each other and serve the same purpose, to preserve to the workingman, as long as possible, his most valuable possession, his power to work, and to afford him a subsistence when the same is lost.

Both branches of this legislation for the care of working men are attributable to imperial initiative: the "working men's insurance legislation" to the Sovereign Message of the first German emperor, William I., of Nov. 17, 1881, and the "working men's protective legislation" to the Supreme Decree of the ruling emperor, William II., of Feb. 4, 1890.

The imperial social politics is built upon the fundamental view that the working class, as created by modern developments, has, in a christianized and civilized State, a claim to be sufficiently protected in its economic existence over against the modern dangers in its vocation and work, as regards life and health, and that this claim is to be legally guaranteed because, as experience teaches, any other mode will fail to reach the desired end.

The industrial insurance legislation includes insurance against sickness, accident, invalidity, and old age. The various measures have been repeatedly revised, improved, and extended, but may be in brief described as follows:

The first of these measures against sickness was passed June 15, 1883. The purpose is to insure a certain and sufficient relief in case of illness during at least twenty-six weeks. The employee pays two thirds of the sick insurance and the employer one third.

In general, all persons regularly employed in factories, mines, on railways, and in other industrial concerns, shop assistants, employees in State services, employees of lawyers, etc., overseers, engineers, etc., must be insured. In general, those intermittently employed, those in dependent positions, employees of the empire (army and navy, etc.), who are otherwise entitled to pensions and free medical aid, are exempted. Other persons, like servants, children, etc., may or may not be insured by the communes. There are six groups of insurance societies or agencies—the sick funds established by the communes for the trades within their limits, the industrial or sick funds of large establishments, the building trades sick funds, the miners' sick funds, the gold funds, and the general funds established by the communes. The funds other than communal are managed by bodies elected by employees and employers, of which the employers may never have more than half as many representatives as the employees. General meetings of all the insured, or delegations of members when there are more than 500, meet annually and elect the managers by secret ballot. The communal funds are managed wholly by the commune, on which, however, all classes are represented. Premiums may not be over 3 per cent of the wages of the class of the individual insured, tho in some instances higher premiums are allowed when a higher scale of relief is given. In general, the minimum of relief is medical attendance and one half the daily wage (twenty-six weeks) when unable to work. Special benefits are given to women in childbirth, and for funerals forty-one times the daily sick pay is

given. A working man earning \$6 per week pays seventeen cents per week, and can receive \$3 sick benefit besides attendance.

Accident insurance was commenced July 6, 1884, and at first dealt chiefly with industrial enterprises, but has been much extended. Accident insurance is at the cost of employers wholly.

In general all employees and overseers with salaries less than \$750 must be insured. The employees form themselves into associations by their trades (*Berufsgenossenschaften*), which not only manage the insurance funds, but may require measures, safeguards, etc., against accidents. These associations are self-governing, tho all is under the supervision of the imperial government. In the case of government employees, the government manages the insurance.

Accident Insurance

The various trades are graded according to the degree of risk. Compensation must be paid even tho there be negligence on the workman's part, unless the accident is caused intentionally. The compensation begins thirteen weeks after the accident, the sick fund or employer being responsible meanwhile. The amount payable varies with the earnings of the injured party and the degree to which his capacity to earn is affected. Earnings in excess of \$375 can only be reckoned on one third of the excess. The minimum is 300 times the local wage of the adult day-labor. A full pension for complete incapacity to work is two thirds of the yearly wage, besides medical attendance, etc. In case of fatal accidents one fifteenth of the yearly earnings is paid with a minimum of \$12.50, and a pension to the widow till death or remarriage of 20 per cent of the earnings, and also to every child to the fifteenth year. Other dependents, like parents, grandparents, grandchildren, or a husband through incapacity dependent partly or wholly on his wife, are also provided for. Details, however, vary very considerably with the occupation, etc..

Invalidity and old-age insurance was enacted June 22, 1889, and subjects to compulsory insurance, after sixteen years of age, all persons regularly working for wages in every branch of trade, apprentices and servants included, managing officials and commercial assistants with regular salaries up to \$500. The old-age and invalidity insurance fund is formed by equal contributions from employers and employed, and an imperial subsidy amounting to \$12.50 per annum is granted to every annuity.

Those entitled to other pensions are exempt. The work of insurance is carried on by insurance societies in cooperation with State administrative bodies and under the imperial government. The representation of employers and employees upon these bodies must be equal. Premiums are payable weekly and are of five

Old-Age Insurance

classes: 3½, 5, 6, 7½, and 9 cents (each payable half by the employer and half by the employee), the class to which a person belongs depending usually on the usual daily wage for his occupation. The annuities commence after 200 weeks for invalidity and 1,200 for old age, together with either incapacity to earn a living or the completion of the seventieth year. The invalidity pension is a minimum of \$12, \$14, \$16, \$18, or \$20, according to the class, with an imperial subsidy of \$12.50 in each class, and increases to a maximum, after fifty years, of \$46.25, \$67.50, \$82.50,

Insurance Against Sickness

\$97.50, \$112.50. In case of the sickness of insured people there are special provisions. Old-age pensions are, \$27.50, \$35, \$42.50, \$50, \$56, in each class. In the event of insured people dying before the age of seventy or of an insured woman's marrying, half the paid premiums are returned.

This "working men's insurance legislation," developed during the years 1883 to 1889, embraces health, accident, inability, and old-age insurance; it is established upon compulsory lines, mutuality, and self-administration, and has been—1899-1903—subjected to a thorough revision, leaving the foundation unchanged, but bringing about many simplifications and improvements. In particular has the legislation supplementary to the health insurance law (1904) extended the obligatory care of the sick from thirteen to twenty-six weeks, thereby establishing an uninterrupted connection with the disability insurance, so that at present, in case of protracted or chronic diseases, a continuous provision is assured.

The principal merits of the German working men's insurance are:

1. It embraces fundamentally everybody needing insurance, over against other systems of provision which, as experience teaches, do not reach the great masses.

2. It affords the working man the most comprehensive provision as it offers not only support by money, but also free medical aid, free medicines and remedies, or free nursing in institutions.

3. It offers the working man the surest and cheapest system, as one third of the health insurance, one half of the inability insurance, and the total of the accident insurance is borne by the employer; the empire contributes in each instance of inability or old-age insurance \$12.50 annually, and the indemnification proceedings are carried out by an impartial body free of charge.

4. The constant cooperation of employer and employed in a common high task works social conciliation and deepens the social sense of one's duty to the whole people.

5. The means and powers of the nation, concentrated in the working men's insurance, have made it possible to solve other problems of civilization, as, for instance, the systematic advancement of popular hygiene, the art of healing in connection with accidents, the fight with tuberculosis, the housing of working men, etc.

Based upon this legislation 60,000,000 persons (the sick, the injured by accident, invalids, and their relatives) received up to the end of 1903 a total of \$1,000,000,000 as indemnity; the working men having raised only the smaller part of this sum in the form of contributions, and receiving an indemnity which was by \$375,000,000 larger than what they paid in.

At the present time \$375,000 are spent daily in Germany for this branch of the working men's insurance alone, and of the accumulated amount of \$375,000,000, nearly \$100,000,000 have been applied to the erection of working men's houses, hospitals, and sanitariums, to places of cure, people's baths, and similar institutions for the advance of the well-being of the public.

In 1904 the following were insured: for sickness, 11,418,446 working people—8,716,816 men and 2,701,630 women; for accident, 18,376,000—13,261,000 men and 5,115,000 women; for invalidism or old age, about 13,756,400—9,105,800

men and 4,650,600 women. Benefits were paid: to 4,642,679 sick people for 90,051,510 days to the amount of 237,107,610 marks; to 834,815 people meeting with accidents for 137,673 days to the amount of 127,308,966 mk.; to 803,232 invalids to the amount of 148,355,804 mk. From 1885 to 1904 the Imperial Insurance Bureau paid: for sick benefits, 2,493,973,793 mk.; for accidents, 1,057,758,585; to invalids from 1891-1904, 1,003,949,912. The expenses of administration for the different departments in 1904 were: insurance against sickness, 14,300,556 mk.; accident insurance, 19,868,251; old age, 14,020,261. The total expenses from 1885-1904 were: sickness, 154,126,770 mk.; accident, 197,126,770; old age from 1891-1904, 116,931,408.

The legislation for the "protection of working men" was inaugurated by imperial edict Feb. 4, 1890, indicating as necessary a revision of the factory laws for the further improvement of the condition of working men, with the aim so to regulate the time, the duration, and the kind of work, that the preservation of health, the laws of morality, the economic requirements of the working men, and their claim to the enjoyment of equal legal rights be taken care of. Legislation of this nature has been largely enacted. (See FACTORY LAWS; RAILROAD LEGISLATION; SUNDAY REST.)

REFERENCE: *Report of the U. S. Labor Bureau*, in preparation, 1907.

INDUSTRIAL LAW COMMITTEE, THE (England): Organized 1888 to fill the need for fuller knowledge of the legal protection extended to the life and labor of the industrial classes, especially in reference to women and children. It stands for the enforcement of the law and the promotion of further reform. The objects of the committee are:

- (1) To supply information as to the legal protection of the industrial classes with regard to the condition of their trade. This information is given by means of correspondence, lectures, and printed matter to persons working among the industrial classes.

- (2) To constitute a central body to which may be reported breaches of the law, and other matters relating to industrial employment, in order that these may be inquired into, referred to the proper authorities, and otherwise treated as may be deemed advisable.

- (3) To consider all information received, to promote further legislation, and the more effective administration of the existing law.

The following injurious conditions are among the most important with which the committee is concerned: Such *injury to life and limb* as may be prevented by the fencing of machinery, lifts, etc., and by provision for escape from fire; and all *injury to health* which may be prevented when it arises from any of the following causes: *Overcrowding*, *defective ventilation*; *effluvia* or other insanitary conditions; *insufficient* sanitary accommodation; *insufficiently* warmed workrooms; *insufficiently* drained floors; *neglect of precautions* in dangerous trades; *insufficient* meal-times; *overwork*. Secretary, Miss Edith Maynard, York Mansion, York Street, Westminster, London.

INDUSTRIAL SCHOOLS (called also **REFORM SCHOOLS**): In the article on CHILD-HELPING there is found a classification of children who require social care—the normal, defective, abnormal, and delinquent. In this article children in the last class are considered—the vicious, depraved, and delinquent above the age of six years and under eighteen. Delinquent youth over eighteen

years of age are treated in the article on REFORMATORIES (or intermediate prisons). Further classification of delinquent children is required according to sex, age, and character. A purely legal mark is that of specific culpability, the act in which some particular law has been violated. But for the present purpose there is not in mind a deed to expiate nor a criminal to punish, but an incomplete and wayward human being to educate. Children of this group should be separated in different institutions or departments according to sex even in the earlier period, for such children are precocious in vice. Children must be classified by age or stage of development, and this requires specialized institutions or several cottages under one management. In order to avoid contamination, the relatively innocent must not be exposed to contact with the more depraved and aggressively demoralizing persons. The bad influence of a girl of only twelve years is sometimes frightful.

In the seventeenth century the Pietists of Germany, under the lead of H. K. Francke, of Halle, established a vast asylum on the congregate plan which still exists. The modern movement for reformatory education derived inspiration from the genial philanthropist and teacher, Pestalozzi, who started a school for neglected children at Neuhof, Switzerland, in 1775, and opened a rescue home at Stanz, in 1798. J. Falk, at Weimar, founded a school in 1821, to prepare wayward children to be placed in family homes. C. H. Zeller organized Pestalozzi's ideas in more practical form at Basel in 1820. J. H. Wichern founded the Rauhe Haus, near Hamburg, in 1833. He broke with the congregate plan and placed the children in family-like groups, each group under a house-father and house-mother. Schaefer reported in 1903 that there were about 400 rescue homes in Germany, with 14,000 places.

In France, with its multitude of societies and institutions working for children and youth, the farm colony at Mettray is best known and has exerted a wide influence. In Various Countries In the establishment of the Ohio school the commissioners brought thence their essential principles of organization, through Mr. Reemelin. In the United States, the Society for the Reformation of Juvenile Delinquents established the House of Refuge in New York City in 1825. Boston (1826) and Philadelphia (1828) followed this example. In 1835 a farm-school was opened for orphans and poor children on Thompson's Island in the harbor of Boston. The Massachusetts reform school was established at Westboro in 1847, and the girls' school at Lancaster in 1855. The CHILDREN'S AID SOCIETY of New York, founded by Charles Loring Brace, has always employed schools in its work of prevention of crime and correction of vicious children.

In the evolution of reformatory education agencies have been specialized. The juvenile or children's court has recently become in cities the judicial center of reformatory discipline. This court, through its probation officers and auxiliary societies, attempts first to fortify and improve family control, and to prevent truancy, and only as a last resort to send a child to an institution. It uses any agency that gives the most promise of helping the particular child. Parental or truant schools are sometimes connected with the public schools, and truant officers seek to help and

guide parents in securing steady attendance. The specialized school trains wayward children until they are ready to take their place again in home and in school. Several states have established reform or industrial schools for children who have violated law and who cannot be kept under restraint and training at home. Private institutions, supported by churches or associations, supplement the public institutions. Such are schools of prevention, refuges for girls, and rescue homes for girls betrayed and corrupted. In some instances these private institutions are subsidized by cities, counties, or by the state. The GEORGE JUNIOR REPUBLIC is a farm-school for dependent and delinquent children which emphasizes the principle of self-government.

The farm-school, as developed in modern lands, has great advantages over institutions in crowded cities. It permits a more rational classification and grouping by providing separate cottages; it isolates the vicious from close contact with the other children; it offers the refining and spiritual influence of nature, its beauty and sublimity. Outdoor life builds up vitality and supplies energy for will. Farm life offers a variety of occupations; all can learn a craft; each can cultivate his peculiar talents. There is variety of service and community of interests. Economically, a school in the country can be maintained at low cost, and much of the vegetable and animal food can be produced by the labor of the children and youth. The educational principles applied in these schools are those which control successful schools for normal children. Rarely have the industrial schools any of the features of a prison, except when a group of older and more depraved youth is present. The physical conditions of health in the situation and equipment of buildings, and in such matters as food, shelter, clothing, exercise, are those prescribed by medical science for all boarding-schools. The regulations for work, play, and moral instruction which succeed with normal children succeed also in these schools. Indeed, the reform schools are exerting a strong influence in improving public-school methods. If the introduction of artistic and trade classes help to reform a bad boy, why will they not help to prevent any boy from becoming depraved? Doubtless, the discipline must be somewhat more watchful and rigorous in reform schools, but prison discipline is not necessary, and is not helpful.

INDUSTRIAL WORKERS OF THE WORLD:

A labor organization formed in Chicago, 1905, to stand (1) for the policy of trade-unions entering into class-conscious Labor or Socialist politics as opposed to the policy of the American Federation of Labor, which opposes trade-unions, as unions, entering politics, and (2) for the solidarity of all branches of labor in one organiza-

tion, as opposed again to the policy of the American Federation of Labor, which grants the largest amount of autonomy to each trade and only federates them in a concerted movement. The preamble to the constitution adopted says:

The working class and the employing class have nothing in common. There can be no peace so long as hunger and want are found among millions of working people and the few, who make up the employing class, have all the good things of life.

Between these two classes a struggle must go on until all the toilers come together on the political as well as on the industrial field, and take and hold that which they produce by their labor, through an economic organization of the working class, without affiliation with any political party.

The rapid gathering of wealth and the centering of the management of industries into fewer and fewer hands make the trade-union unable to cope with the ever-growing power of the employing class, because the trade-unions foster a state of things which allows one set of workers to be pitted against another set of workers in the same industry, thereby helping defeat one another in wage wars. The trade-unions aid the employing class to mislead the workers into the belief that the working class have interests in common with their employers.

These sad conditions can be changed and the interests of the working class upheld only by an organization formed in such a way that all its members in any one industry, or in all industries, if necessary, cease work whenever a strike or lockout is on in any department thereof, thus making an injury to one an injury to all.

Section 1. This organization shall be known as "The Industrial Workers of the World."

Sec. 2. (a) And shall be composed of thirteen (13) International Industrial Departments, subdivided in industrial unions of closely kindred industries in the appropriate organizations for representation in the departmental administration. The subdivision International and National Industrial Unions shall have complete industrial autonomy in their respective internal affairs, provided the General Executive Board shall have power to control these Industrial Unions in matters concerning the interest of the general welfare.

Several unions, notably the Western Federation of Miners, with 30,000 members, have joined the Industrial Workers (tho the Western Federation is bolting from it), with other individuals, mainly Socialists, making a membership at one time of 60,000. In 1907 only 7,000, however, have paid dues. *Secretary:* Wm. J. F. Hanneman, 148 West Madison Street, Chicago, Ill.

INFANT MORTALITY (see DEATH-RATES): Infant mortality in most countries seems upon the increase even where the general death-rate is falling. This is the conclusion arrived at, among others, by Dr. George Newman, in his book "Infant Mortality" (1907). He gives the following table, which shows both the enormous death-rate for infants compared with the general death-rate, and also for almost all countries an increase in the rate.

INFANT MORTALITY RATE

| | General death-rate, 1893-1902 | Infant death-rate | | |
|----------------------|-------------------------------|-------------------|-----------|------|
| | | 1883-1892 | 1893-1902 | 1903 |
| England and Wales... | 17.6 | 144 | 152 | 132 |
| Scotland..... | 18.0 | 120 | 127 | |
| Denmark..... | 16.5 | 132 | 133 | |
| Russia..... | 32.9 | 270 | 272 | |
| Germany..... | 21.5 | | 195 | |

The causes of infant mortality and of its increase are undoubtedly involved, but Dr. Newman finds them largely antenatal. From his studies in Great Britain he concludes that 30 per cent of the deaths are due to premature birth. This and other antenatal causes he finds largely due to economic causes in the increased stress of modern life, and particularly to the increase of woman's work. Recent German medical investigations have also shown the intimate connection between high infant mortality and woman's work, particularly in mills, working often during advanced pregnancy and too soon after birth. Unhealthy and overcrowded housing among the poorer classes is another fatal cause. Dr. Newman shows this by the following table:

INFANT MORTALITY FROM ALL CAUSES IN HOUSES OR TENEMENTS OF DIFFERENT SIZES AT THE METROPOLITAN BOROUGH OF FINSBURY, LONDON, 1905

| SIZE OF TENEMENT | Census population, 1901 | Number of births | ALL CAUSES | |
|--|-------------------------|------------------|-------------------------|-----------------------------------|
| | | | Number of infant deaths | Infant mortality per 1,000 births |
| One room..... | 14,516 | 532 | 117 | 219 |
| Two rooms..... | 31,482 | 1,216 | 192 | 157 |
| Three rooms..... | 21,280 | 468 | 66 | 141 |
| Four rooms and over..... | 33,185 | 464 | 46 | 99 |
| Institutions and deaths and births not traced..... | 1,000 | 206 | 8 | 39 |
| The borough..... | 101,463 | 2,886 | 429 | 148 |

Mr. B. Seeborn Rowntree found the same in York in his investigations in 1898, as is seen by the following ("Poverty, a Study of Town Life," 1901):

INFANT MORTALITY IN YORK (1898)

| AREA | Infant mortality rate | General death-rate | Death-rate over 5 years of age |
|----------------------------------|-----------------------|--------------------|--------------------------------|
| Area 1. Poorest working class... | 247 | 27.7 | 13.8 |
| Area 2. Middle working class... | 184 | 20.7 | 10.2 |
| Area 3. Highest working class... | 173 | 13.4 | 7.5 |
| Servant-keeping class..... | 94 | | |
| City of York as a whole..... | 176 | 18.5 | 11.1 |

All these facts point to poverty as the cause, with its indirect results of ignorance, neglect, and vice.

Fabian Tract No. 5 (1906) says of children:

Their death-rate from all causes in England and Wales in 1904 was 51.62 per thousand; 60.69 in urban counties, and 38.14 in rural counties. The highest death-rate among children was in Lancashire (67.67); the next highest was Durham (62.37); while London came twelfth (54.79). The lowest death-rate was in the county of Westmorland (34.02).

The infantile death-rate at Bethnal Green is twice that of Belgravia. Holborn (151.835) and St. George's, Hanover Square (149.748), have almost equal populations; yet in the former, 1,614, in the latter only 1,007 children under five died in 1884. (Registrar-General's Report, 1886, pp. 32, 126, C-4,722).

Dr. Playfair says that 18 per cent of the children of the upper class, 36 per cent of those of the tradesmen class, and

¹ No figures for a comparison of this kind are given in the Registrar-General's Reports for years subsequent to 1884.

55 per cent of those of the workmen, die before they reach five years of age (quoted at p. 133 of "Dictionary of Statistics," by Mr. Mulhall, who, however, thinks it "too high an estimate").

Mr. John Spargo in his "The Bitter Cry of the Children" has compiled considerable testimony on this point (p. 7-56):

He tells us that Wolf, in his studies based upon the vital statistics of Erfurt for twenty years, found that of every 1,000 children born in working-class families, 305 died the first year; among the middle classes, 173; and among the higher classes only 89 ("Diseases of Children," by H. Ashby, M.D., and G. A. Wright, p. 12). Dr. C. R. Drysdale, senior physician of the Metropolitan Free Hospital, London, says that the death-rate of infants among the rich is not more than 80 per cent, while among the very poor it is often 40 per cent ("Transactions of the Nat. Assn. for the Promotion of Social Science," 1882, p. 388). He quotes Dr. Ashby as saying: "In healthy children among the well-to-do class, the mortality (from measles) is practically nil; in the tubercular and wasted children to be found in workhouses, hospitals, and among the lower classes the mortality is enormous (idem, p. 328). Yet there were 8,645 deaths of infants by measles in the U. S. in 1900. Convulsions, tuberculosis, etc. are also largely diseases of poverty. A list of sixteen consecutive cases, copied from the New York Babies' Hospital, showed the most prominent feature of 75 per cent of the cases to be malnutrition. Says a clerk to the health board of Lawrence, Mass.: "Ignorance in the preparation of food, illy ventilated tenements, and, in many cases, unavoidable neglect occasioned by the mothers being obliged to work away from their children, often leaving their babes in the care of other children, seem to be the prime factors in the high mortality among children."

INGRAM, JOHN KELLS: Economist, positivist; born in Donegal, Ireland, 1823. Educated at Newry School, and at Trinity College, Dublin, where he was successively scholar, fellow, professor of oratory and English literature, regius professor of Greek, and librarian. In 1878 he became president of the Statistical Society of Ireland, when his address in that capacity on "The Present Position and Prospects of Political Economy" attracted much attention. He is the author of the article on political economy in the "Encyclopædia Britannica" (9th ed.), and on slavery, both of which have since been published in book form as "A History of Political Economy" (1888) and "A History of Slavery and Serfdom" (1895). His later writings have been on positivism. Address: 38 Upper Mount Street, Dublin, Ireland.

INHERITANCE TAX, THE: The inheritance tax is a tax levied on the occasion of the transfer of property at death. A collateral inheritance tax is one that exempts from its provisions inheritances passing to the father, mother, husband, wife, or a lineal descendant. A graduated or progressive inheritance tax is one in which the rate of the tax increases with the size of the estate or the amount passing to a single individual.

Inheritance taxes tho imposed in various forms and at various times for centuries are in their present form a modern development. The inheritance tax to-day is found in almost every civilized country of any importance. It is found in the Australian commonwealths, Austria, Belgium, the Canadian provinces, Cape Colony, Denmark, France, the principal German states, Great Britain, Greece, Holland, Italy, Norway, Rumania, Russia, Spain, Sweden, the cantons of Switzerland, and in thirty-five of the states and territories of the United States.

Numerous divergent theories have been evolved

to justify the imposition of an inheritance tax. Dr. West has summarized these as follows:¹

Inheritance and bequest may be restricted in two directions—according to relationship and according to amount; the circle of relatives between whom inheritance operates may be narrowed, or a limitation may be put upon the amount which one person may receive from the estate of another. Corresponding to these two methods of limitation there are two arguments for the inheritance tax: (1) That which looks to the limitation of collateral inheritance or the extension of escheat, and (2) that which concerns itself with the effect on the diffusion of wealth. Regarding the tax as a fiscal imposition, it may be considered either as a fee or as a tax—as a payment in return for benefits received, or as a public contribution according to the ability of the taxpayer. Each of these two conceptions, again, may be supported by either of three different arguments. The payment may be regarded as (3) a return for government services in general, or (4) for special services connected with the system of inheritance and bequest, according to the value of the service to the individual, or (5) as a means of defraying the cost of probate courts; and accordingly we have what may be called the partnership, the value of service and the cost of service arguments. Leaving the matter of individual benefit out of consideration altogether, the inheritance tax may be explained as (6) a payment of back taxes evaded during life, (7) a property tax paid in a lump sum once in a lifetime, or (8) a tax on a particular form of accidental income.

In the present brief article these numerous theories cannot be considered. It seems clear, however, that the controlling justification of the inheritance tax in its present-day form lies in the privilege and duty of the State to regulate the inheritance of property in such a way as to best promote the general welfare. Inheritance is a social institution which like all others must stand the test of social utility. It is good in so far as it is socially useful and must always be subject to such regulation and modification as is demanded by the supreme test, social utility. This has been practically recognized in all lands and ages. The legal right to determine the control of one's property after death has always been limited in the interest of the supposed public welfare. The legal right of kin to inherit in case of intestacy has also been limited.

The right of bequest and inheritance is a natural right only to the extent that it is socially useful; that it furnishes an incentive to the creation of wealth or furthers its preservation and judicious management. Altho device and descent are upheld as the best-known method of securing this end, yet it must be admitted that this method is open to serious objections and often fails completely. While the man who acquires wealth by that act gives evidence of his ability to manage it properly, it is by no means so certain that his heirs will possess that qualification. It is most fitting, therefore, that the State in apportioning the burden of taxation should take cognizance of this condition and obtain a portion of its revenue from estates at the time of their transfer to hands that have given no evidence of ability to manage them economically. Such a tax, if the rate be moderate, can only further the true social function of devise and descent, i. e., the furtherance of the creation and the judicious management of wealth. The tax is an incentive rather than a hindrance to the creation of wealth and insures that after its transfer at death a certain portion, at least, will serve a socially useful purpose.

The inheritance tax will decrease the number of social drones. There will be fewer Newport palaces built by widows and sons and daughters, whose only conception of social service is typified

¹ See his article entitled "Theory of the Inheritance Tax," in *Political Science Quarterly* for Sept., 1893.

in the Newport round of lavish expenditure and selfish pleasure. The support of the idle rich is becoming a heavy drain upon the wealth of the nation. This class is made up almost entirely of persons who have inherited their wealth. Men have amassed such enormous fortunes that after their death the natural increase from the property is more than enough even with the most lavish expenditure to maintain their descendants in idleness forever. It would be difficult to find any social or economic justification for such a manifest social wrong. In every community, and especially in the older communities, there are able-bodied men and women living in complete or partial idleness as a result of inherited wealth. Their lives would have been more useful and the world would have been richer had they received no inheritance or one smaller in amount.

The inheritance tax is a tax on property that can in no way be shifted so as to become a tax on labor or industry. It is generally recognized that property should be taxed at a much higher rate than labor, and from this it follows that the man in active business whose income is largely the result of his own energy and labor should not be subject to as high a rate of taxation measured by income as the man whose income is from money in savings-banks, bonds, and other perfectly safe investments. The income in the one case is largely the reward of labor, and in the other the interest on past accumulations in the investment of which only a trifling amount of labor is involved. The tendency of a moderate additional tax on the latter form of income is to decrease the number of those who do or may enjoy a competence without any personal exertion. It decreases the number of social drones and adds to the effective labor force. Its effect is somewhat similar to that of a decline in the rate of pure interest. When it is remembered that most fortunes are created by men in active business, who give their entire time and strength to the work, and that those who live from their incomes without themselves engaging in active business, or, in other words, laboring, are in most cases those whose fortunes have come to them through inheritance, the advantage of the inheritance tax as a means of placing an additional burden on property, without at the same time taxing labor or industry, is very apparent. A tax of 10 per cent on a bequest is equivalent to an annual tax of 10 per cent on the income from the bequest.

The inheritance tax is, moreover, the best substitute for the present ineffectual attempt to tax intangible personality directly by means of the general property tax. A common sense of justice demands that the bond and mortgage holder should pay a substantial tax on his income from the investment, but, as is well known, the direct tax on this class of property is either evaded entirely or shifted to the borrower. The inheritance tax, however, can only with great difficulty be evaded and cannot be shifted; and will most effectually reach this class of wealth that is at present practically exempt from taxation. To partly compensate for their exemption from direct taxation, bonds and mortgages passing at death should be subject to taxation at a higher rate than property not thus exempt. And even if no bonds or mortgages are included in the estate, the inheritance tax nevertheless indirectly reaches this kind of property, for the recipient will most probably invest a portion of his inheritance in stocks and bonds, and the tax is

equivalent to annual tax on the income from this investment.

As a result of the fact that the inheritance tax does not tax industry and can in no way be shifted, its imposition or alteration results in no disturbance of business or industrial relations. This is a most notable advantage, for the restrictive and prohibitive effects of some taxes and the severe disturbance of industrial conditions resulting from the introduction of other taxes are extremely important, and are the causes that most often prevent the adoption of legislative reforms. The inheritance tax can be imposed and its rate altered from time to time in response to the demands of justice or to the needs of the state without producing industrial disturbance or hardship.

The justification and desirability of the tax having been considered, the next question is that of a proportional or a progressive rate.

Progressive Rate

1. In the first place, it is universally recognized that there should be some progression in rate as between different classes of heirs. If direct heirs are taxed at all they are almost invariably taxed at a lower rate than collateral heirs. In many American states direct inheritances are taxed 1 per cent and collateral inheritances 5 per cent. The heirs should be divided into a certain number of classes based on the equitable claim which they have to the property of the decedent, due to dependence on him for support or to cooperation in any degree in the accumulation of the property. It seems just that in the case of husbands, wives, and minor children there should be a larger exemption or lower tax than for any other class of heirs, and that adult children and parents should not be taxed so highly as collateral heirs.

2. The same reasons that have been adduced to show the justice of the inheritance tax are also arguments for a rate progressive as to the amount of the inheritance. (1) The danger of mismanagement is greater in the case of large than of small inheritances; (2) the larger the inheritance the greater the probability that its recipient will render no adequate social return for the income he receives; and (3) the larger the inheritance the greater the probability that it will be invested in such a way as to largely escape direct taxation. The practical limit to the progression is the point at which the creation of wealth is discouraged or means of evasion devised.

Inheritance taxes having graduated or progressive rates exist in the leading foreign states and countries. They are found in the Australian states, the Canadian provinces, the cantons of Switzerland, and in France and Great Britain. In France the rate on inheritances passing to collateral heirs or to strangers in blood varies from 3½ per cent to 18½ per cent. The rate in the case of direct heirs varies from 1 per cent to 2½ per cent. In Queensland the rate for collateral heirs or strangers in blood varies from 2 per cent to 20 per cent, and for direct heirs from 1 per cent to 5 per cent. In the province of Ontario the rate for collateral heirs or strangers in blood varies from 5 per cent to 10 per cent, and for direct heirs from 1 per cent to 8 per cent. In the canton of Lucerne, Switzerland, the rate for collateral heirs or strangers in blood is from 5 per cent to 20 per cent.

The following table was prepared by Solomon Huebner and published in "The Quarterly Journal of Economics," Aug., 1904:

PROGRESSIVE INHERITANCE TAXES IN FOREIGN COUNTRIES

| COUNTRY | For collateral heirs | | For direct heirs | | Strangers in blood | | Progressivity (on basis of property) | Other exemptions |
|---|----------------------|--------------------|-------------------|--------------------|--------------------|--------------------|--------------------------------------|--|
| | Rate per cent | Exemption | Rate per cent | Exemption | Rate per cent | Exemption | Rate per cent | |

¹ One half of collateral rates on amounts not exceeding £50,000. In certain cases the rate applies to distributive shares.

² Progression ceases with collateral heirs at £20,000, and with direct heirs with £200,000.

³ £1,500 exempted if estate does not exceed £2,500; if in excess no exemption.

⁴ Direct heirs pay one half of collateral rates.

⁵ One half of collateral rate on property passing to certain direct heirs when total net value does not exceed £50,000.

⁶ Progressive schedule applies only to direct heirs. Progressivity on basis of property.

⁷ Share passing to immediate relatives.

⁸ Schedule rates doubled on property passing by transfer out of the province.

⁹ Proceeds devoted to asylums, hospitals, and other charities.

¹⁰ Great Britain has also a "probate duty," "account duty," "temporary estate duty," and a "corporation duty."

¹¹ Paid upon the principal value of all property, real or personal, settled or unsettled. Settled property is subject to a further estate duty of 1 per cent, called "settlement estate duty."

¹² Small estates up to £500 gross pay a duty of 30s. Small estates up to £500 pay a duty of 50s. These duties are inclusive of all other "death duties."

¹³ Legacy of any value, and any share of residue of personal estate arising under will or intestacy.

¹⁴ Succession duty applies to a succession of the value of £50 or upward, where the whole succession derived from the same predecessor amounts to £100 or upward. One half per cent of the succession duty on lineals and 1½ per cent on other descendants constitutes what is called "additional succession duties." This additional duty is not payable when the property subject to the succession is chargeable with estate duty.

¹⁵ Rate applies to child, descendant of child, father, mother, or lineal ancestor, and is not payable where probate or letters of administration were obtained or where "account duty" or "estate duty" has been paid.

¹⁶ The "legacy duty" and the "succession duty" together practically constitute a collateral inheritance tax paid in addition to the "estate duty" with the exception, however, that estates valued at £1,000 or less are subject only to the "estate duty."

¹⁷ One per cent to 20 per cent on amounts up to 10,000 francs. Rate then increases by one tenth through a series of ten steps until it becomes ten tenths higher than the primary rate.

¹⁸ Two per cent to 10 per cent on amounts between 2,000 and 10,000 francs. Rate then increases one tenth for each additional 10,000 fr. until it becomes ten tenths higher than the primary rate.

¹⁹ Two per cent to 10 per cent on amounts up to 10,000 francs. Rate then increases by one tenth for each additional 10,000 fr. until it becomes five tenths higher than primary rate.

It is only within the last ten years that inheritance taxes with graduated rates have been imposed in the American states. At present in about one third of the thirty-five states having an inheritance tax the rate is progressive, increasing with the size of the estate or the amount passing to a single individual. This is a notable feature of many of the more recent statutes. In recent laws enacted in California and Wisconsin the rates vary from 1 per cent to 15 per cent. Colorado, Illinois, Minnesota, Nebraska, North Carolina, Oregon, Porto Rico, South Dakota, Washington, Wisconsin, and California all have adopted a more or less progressive rate. Illinois was the first state to pass a law of this nature. The Illinois act passed in 1895 and upheld by the U. S. Supreme Court imposes taxes at the following rates on all property, real and personal:

1. One per cent on excess of \$20,000 passing to father, mother, brother, sister, husband, wife, child, or lineal descendant.

2. Two per cent on excess of \$2,000 passing to uncle, aunt, nephew, niece, or lineal descendant of same.

3. On all estates passing to other heirs: \$500 to \$10,000, 3 per cent; \$10,000 to \$20,000, 4 per cent; \$20,000 to \$50,000, 5 per cent; exceeding \$50,000, 6 per cent.

The Wisconsin act of 1903 was the most carefully drawn and elaborately graduated law that had been enacted up to that time. It embodies the following features: primary rates ranging from 1 to 5 per cent being fixed according to relationship for inheritances not exceeding \$25,000, these rates are multiplied by 1½, 2, 2½, and 3 for the excess above \$25,000, \$50,000, \$100,000, and \$500,000 respectively as shown in the table given on page 624, which brings out the most important facts.

| RELATION | Exemption | Not exceeding \$25,000 | \$25,000-\$50,000 | \$50,000-\$100,000 | \$100,000-\$500,000 | In excess of \$500,000 |
|---|-----------|------------------------|-------------------|--------------------|---------------------|------------------------|
| Widow..... | \$10,000 | 1% | 1½% | 2% | 2½% | 3% |
| Husband, direct heirs Brothers and sisters and their descend- ants, sons-in-law, daughters-in-law | 2,000 | 1% | 1½% | 2% | 2½% | 3% |
| Uncles and aunts and their descend- ants..... | 500 | 1½% | 2½% | 3% | 3½% | 4½% |
| Great-uncles and great-aunts and their descendants. | 250 | 3% | 4½% | 6% | 7½% | 9% |
| All others..... | 150 | 4% | 6% | 8% | 10% | 12% |
| | 100 | 5% | 7½% | 10% | 12½% | 15% |

The California Act of 1905 is modeled very closely after the Wisconsin law.

ROBERT H. WHITTEN.

INJUNCTIONS: In order to obtain a right understanding of this subject it is necessary to examine it historically. Our law is derived from that of England, which in the beginning knew only two remedies, a criminal proceeding instituted in the name of the king to punish the wrongdoer by imprisonment or fine, and a civil action by a private person to obtain money damages in contract or in tort. The remedy in damages was often found to be inadequate, there being various wrongs for which a money judgment would not afford the right kind of reparation. For example, a powerful noble might fence off a right of way belonging to the inhabitants of a village; and if he could only be sued for the pecuniary damage done to each, he might gladly pay and keep the way closed. The actual pecuniary loss to each villager would often be nominal. Thus he would virtually have the power to increase the value of his estate by getting rid of a right of way through his own wrong and at small cost. Various other acts by the influential and the powerful can be imagined which would be illy recompensed by a judgment in damages.

In those days the king was looked upon as the fountain of power as well as justice. "The king could do no wrong," and might safely be invoked to command the right. Hence his subjects fell into the habit of coming to him with humble

petitions, saying, for example in the case of a right of way, that one of his subjects had wrongfully closed a way over which other subjects had a right to pass, and as their remedy to recover damages was clearly inadequate, would his Majesty, in the plenitude of his power and as the fountain of equity, graciously be pleased to order that the way be opened, so that they might enjoy it as aforetime. The king, not wishing to be taken from the pleasures of the chase or other matters of greater moment to him than the welfare of humble subjects, would refer the petition to the keeper of his conscience, an officer of his household, usually a priest, called a chancellor, who was empowered to examine into the facts, and advise the king what in justice ought to be done. The chancellor would issue a writ in the name of the king, commanding the offending party to appear and answer the prayer of the petitioners and show any reason he might have for closing the way. Testimony would then be taken on behalf of both sides, and the chancellor would report the facts to the king, who thereupon, if the right of way was proven and its wrongful closing made out, and if he felt in a gracious mood, would order the wrong-doer to refrain from obstructing the way. In other words, the king would enjoin the wrong-doer from continuing his wrongful act under penalty of imprisonment for contempt if he disobeyed the injunction. So with other wrongful acts of a continuing nature, the king upon advice of the keeper of his conscience would enjoin the doing of them whenever the remedy at law was inadequate. He would also give commands to do various things as to which the law gave no redress.

In time this became crystallized into a system of jurisprudence called equity, as distinguished from law. The chancellor became a judge, who decided causes on such petitions in the name of, but without troubling, the king. Equity thus came in as a supplement to law. The system was expanded so as to include injunctive commands—now called mandatory injunctions—to do things as well as to refrain from doing them.

Our forefathers brought to this country this dual method of administering justice, the common-law remedy by way of damages and the equitable by way of a decree to do that which is right.

As equity was supposed only to supply the deficiencies of the law, it became necessary that equity jurisprudence should be administered under a set of definite rules. They are known as "the rules in equity." Chief among them are the following: Equity follows the law. Where the equities are equal the legal title must prevail. He who asks equity must do equity. He who comes into a court of equity must come with clean hands. If the remedy at law is adequate a court of equity cannot act.

The illustration of the obstruction of a right of way is peculiarly apt for the purpose of an article on injunctions in such a work as this, because the now famous phrase "government by injunction" grew out of a case which involved an obstruction of the public highway. During many years courts of equity had been granting injunctions against unlawful obstruction of the highway. For example, some enterprising tradesman might put in his shop window a spectacle to attract crowds, who, gathering to look at it, would obstruct access to a neighbor's shop, and at the latter's instance a court of equity would enjoin

the former from doing the act, which by attracting a crowd resulted in obstructing the sidewalk.

The case above referred to is that of *ex parte Debs* in 1894 (158 U. S., 564). There has been much popular misunderstanding as to the extent and character of that decision. The day is coming when, instead of being denounced by labor-unions as a "blow at labor," it will be recognized as one of the most valuable decisions in defense of the rights of the laboring man, as well as the community at large.

Government by Injunction

It grew out of the Pullman car strike of the year before at Chicago, in the course of which the running of railroad trains and transmission of the mails was interrupted by the mob. It was based upon the theory which for long had been accepted law, that railroads are public highways.

Briefly stated, the Supreme Court held that the right of regulating interstate commerce and the right of transmission of the mails furnish adequate grounds on which to found the jurisdiction of a U. S. court of equity to prevent, by injunction, the forcible obstruction of a public highway in such manner as to impair those rights; that this jurisdiction to issue an injunction involves the right to punish, as a contempt, the violation of such injunction, tho the acts complained of might constitute a crime punishable at law; and that the facts that the act complained of were being done by a large number of men did not deprive the court of a jurisdiction, which had for many years been exercised where the obstructions of the highway were few in number.

The court, however, made certain limitations, which seem to have been overlooked or forgotten not only by the general public, but also by many of the lower courts, which have since used that decision as if it were a warrant for injunctions which can fitly be characterized in no other way than as gross usurpations of judicial power.

Speaking by Judge Brewer, the Supreme Court distinctly said:

"It must be borne in mind that this bill was not simply to enjoin a mob and mob violence. It was not a bill to command a keeping of the peace; much less was its purport to restrain the defendants from abandoning whatever employment they were engaged in. The right of any laborer or any number of laborers to quit work was not challenged. The scope and purpose of the bill was only to restrain forcible obstructions of the highways along which interstate commerce travels and the mails are carried. And the facts set forth at length are only those facts which tended to show that the defendants are engaged in such obstructions."

From this summary it will be seen that a number of points, popularly supposed to have been decided by the *Debs* case, were not passed on, viz.:

- (1) That persons not made parties may be enjoined.
- (2) That lawful gatherings on the highway may be enjoined.
- (3) That the exercise of the right of free speech may be enjoined.
- (4) That any lawful act may be enjoined.

It is not too much to infer from the quotation above given, that if any of those points were to be presented to that court, the outcome would be in favor of what has generally been taken by both public and legal profession to be the law. It is true that there were some parts of the injunction as granted by the lower court in the *Debs* case which violated one or other of those principles—which principles must be regarded as pertaining to fundamental rights. The parties actually punished in that case were, however, parties to the action, and it does not appear that any objections to the injunction, on which the Supreme Court did not pass, were specially urged upon its attention. Therefore it can not be held to have approved them. In the passage above quoted the force of the word "only" should ever be taken into account: "The scope and purpose of the bill was *only* to restrain forcible obstruc-

tions of the highways along which interstate commerce travels and the mails are carried." It is a matter of course that the injunction had no legality as to acts outside "the scope and purpose of the bill."

It should also be remembered that the Supreme Court was bound by the findings of fact of the lower court, and so stated in express terms: "Its (the lower court's) finding of the fact of disobedience is not open to review on habeas corpus in this or any other court."

The popular misapprehension, above mentioned, has been largely due to the fact that in subsequent decisions of the lower courts, particularly the federal, the points above emphasized as in no way decided by the *Debs* case have been improperly assumed to be logical deductions from that decision. A few examples will suffice:

In a suit brought by the American Steel and Wire Company, in Cleveland, Ohio, in 1898, the defendants were, among other things, enjoined "from in any manner interfering with" the company's business.

In the case of *The Sun Printing and Publishing Company vs. Delaney* and others (1899) the Supreme Court of New York, among other things, enjoined the defendants from the exercise of their right to give the public their side of their controversy with the *Sun* as an argument against advertising in a paper which they claimed had treated them unjustly; it also forbade them from attempting to persuade news dealers from selling the paper; and, finally, wound up with a sweeping restraint "from in any other manner or by any other means interfering with the property, property rights, or business of the plaintiff." It should be added that, on appeal, the Appellate Division struck out these commands; but they were so plainly subversive of fundamental rights that it is difficult to see how they could have been granted in the first instance.

In still another case last year (*The Wheeling Railway Company vs. John Smith* and others, so runs the title of the action without naming the others, in the U. S. Circuit Court, West Virginia) two men not parties to the action, nor found to be agents of "John Smith and others," whoever they may have been, were punished for contempt of court for, among other things, "reviling" and "cursing"—the court not at all, but for "reviling" and "cursing" employees of the railroad company. If these men had not actually served out an imprisonment in jail for thirty days as a punishment for contempt of corporation, it might be thought that this example was taken from opera bouffe. The legality of this punishment was never passed on by the Supreme Court, for the reason, it is said, that the parties were unable to bear the expense of taking it there, and so served their term in jail.

In 1900 an injunction was granted in *Levy vs. The Cigar Makers' International Union* and others, by the Supreme Court in New York, of which it is difficult to speak in terms of moderation. Officers of the union and the other defendants were prohibited, not only from "picketing" (which when peaceable has not yet, in New York, been decided by its highest court to be unlawful; see *Reynolds vs. Everett*, 144 N. Y., 189, and 67 Hun., 294); not only from "accosting" the plaintiffs and their new hands or persons seeking their employment; not only from doing "any act or thing" which had the tendency of "molesting" the plaintiffs, whatever that may mean; not only "from any interference with" the plaintiffs and their employees and persons seeking work in their factory, in the adjacent streets, "or in any other place"; but also from paying or offering any money to former employees for the purpose of "continuing organized, concerted, and combined action" on the part of the strikers with the object of interfering with the plaintiff's business.

In other words, this injunction forbade the defendants even from approaching their former employers for the laudable purpose of reaching an amicable result; it forbade them from making their case known to the public if the tendency of that was to vex the plaintiffs or make them uneasy; it forbade them from trying in a perfectly peaceable way in any place in the city, even in the privacy of a man's own home, to persuade a new employee that justice was on their side, and that he ought to sympathize with them sufficiently not to work for unjust employers; and, finally, it forbade the union from paying money to the strikers to support their families during the strike.

These portions of the injunction were so plain a violation of the rights of the defendants at common law, under the Constitution, and especially under section 171, of the N. Y. Penal Code, that they were set aside as soon as brought to the deliberate attention of the court.

It cannot be necessary to multiply instances of injunctions which, whether valid or not in some respects, are in others plain usurpations of

power. It is, however, worth while, to call attention to a strange freak of a court in 1899, which as it did not happen in a labor dispute is all the more noteworthy.

The Texas Court of Appeals (ex parte Warfield, 50 S. W. Rep., 933) upheld the validity of an injunction which it is safe to say is without parallel in the history of jurisprudence. A husband claiming damages from Warfield for alienating the affections of his wife, obtained an injunction commanding him not to speak to, nor communicate with, the wife, nor to go near her at the house where he boarded, nor at "any other house or place in the City of Dallas, or State of Texas." Shortly afterward the defendant happened to meet the wife, and had some casual conversation with her, for doing which he was found guilty of contempt of court and fined \$100 and sent to jail for three days. He naturally tried to get out on habeas corpus, and, incredible to relate, failed to do so. It has therefore been solemnly adjudged to be the law of Texas, that a jealous husband, upon proof that he fears a breach by his wife of the seventh commandment, can have the aid of a court of equity to prevent correspondence between the parties by which it might be brought about. This may be styled marital fidelity by injunction. There was even a case in Ohio where a mother obtained an injunction against the marriage of a son upon the plea that he was not of sound mind! Unless checked we might come in time to have etiquette by injunction. If our judges ought to be regulators of conduct, and enforce the ten commandments or other rules of right behavior by mandatory injunctions, then it were better to confer the power upon them by due act of legislature, than to allow them to take it without right.

Where an injunction is disobeyed the court can inflict punishment by fine or imprisonment without the aid of a jury. Thus the judge, whose writ is alleged to have been defied, is the one who passes on the issue of fact created by a denial of the charge; and he is the person who imposes the sentence if he finds the charge is true.

This power cannot safely be done away with altogether, but the tendency of the courts to stretch their jurisdiction beyond the bounds set in the Debs case became so general a few years ago, and the consequent mischief of allowing a usurping court to act as a jury in its own cause so serious, that it was apparent that legal measures in restraint should be adopted if respect for law is to be preserved. He is the worst enemy of this republic who does anything to break down reverence for law or respect for the courts.

In consequence, various bills were prepared for passage by Congress and state legislatures. The agitation of the subject, while it has not produced as yet any fruitful legislation, has had one good effect. It has reminded judges that the power to command a future act is more dangerous than to punish a past one, dangerous to the wielder of the power as well as to others, and must be handled with circumspection. Of late years there have not been so many illegal injunctions. At the same time it would seem clear that it would be the part of wisdom to impose certain limitations on the power of the courts in issuing and enforcing injunctions of all sorts.

The following limitations are believed to be ample, conservative, and necessary: (1) That injunctions shall not be issued against any but parties to the action, their agents, servants, and

attorneys; (2) that when an injunction, however valid in part, prohibits the lawful use of the highway, or the right of free speech, or

Limitations lawful combination to advance joint interests, it shall be void in toto;

(3) that all persons who are charged with disobedience of an injunction in respect of a matter which might be the subject of indictment, shall have the right to demand a trial by jury upon issues of fact to be properly framed; (4) that whenever the question, whether an injunction, pending an action, should be granted depends upon the determination of questions of fact arising on conflicting affidavits, either side shall have the right to demand that a jury be forthwith impaneled to try the same upon issues properly settled.

It is instructive to note the development in a republic of a writ which had its origin in kingly prerogative. Also to observe that the power to command begets in the commander, whether he be king, president, general, priest, judge, or walking delegate, the disposition to stretch his jurisdiction and to sanction illegality by pleading the cause for which he stands, and which he comes to believe is symbolized in himself. It is the old delusive pretense, ever repeated, that the end justifies the means. The king says, I am the State; the president, I have a mission; the general, I uphold the government; the priest, I contend for the infallible Church; the judge, I stand for law and order; the walking delegate, I strike for the holy cause of labor. Poor weak, erring mortals ye be, ye kings, presidents, priests, generals, judges, and walking delegates. Exercise your lawful powers of command, for they are necessary for the general welfare, but learn to do so with fear and trembling, with care and moderation, lest ye work ill rather than good.

Injunctions in labor disputes need especial scrutiny, for that the real, tho unexpressed, reason for them usually is not so much that the remedy at law, criminal and civil, is inadequate, as that the enforcement of that remedy is unattainable through the cowardice or supineness of the officers of the law. Had the rioters in the "Pullman strike" at Chicago, who were burning property and murdering persons, been arrested at the point of the soldier's bayonet, if the policeman's billy was inadequate, had they been brought to the bar of justice by a fearless district attorney and honest grand jury, in short, had the criminal law been invoked, the Debs contempt case had never been. The subsequent illegal injunctions, based on erroneous conceptions of that decision, had never been. The phrase "government by injunction" had never been. But if the officers of the law will not do their duty, then the desire for law and order will nevertheless find vent; and the serious question thus arises, Which is preferable, a court of equity, or a vigilance committee? There is a district attorney elected in every county in every state in our union. How many of them have the moral courage to face a mob composed of voters to whom they owe their election? It may not be, it certainly is not, a justification for an illegal injunction in a labor dispute, that it was granted in the interests of law and order; but the plea that it was will always appeal to an unreflecting public. Therein lies the danger. Illegal injunctions in labor disputes, granted because the officers of the law will not do their duty, are for the public what morphine is

Danger

for the individual—an alleviation of present pain at the expense of future misery. Yet doctors prescribe morphine, and their patients take it. Judges grant questionable injunctions, and the public approves them. The real remedy against any unlawful stretch of power by courts of equity in such matters is to create a public opinion which shall demand that the criminal authorities use their lawful powers to the full extent.

The need is greater than ever that the memorable words, written in the cabin of the *Mayflower* three centuries ago, should be borne in mind by all citizens in the land, the highest official, as well as the lowliest individual: "To the end, that this shall be a government of laws and not of men."

JOHN BROOKS LEAVITT.

INNER MISSION, THE (*Der Central-Ausschuss für die Innere Mission der deutschen Evangelischen Kirche*): A German organization of evangelical, practical, and social effort for the spread of the kingdom of God within the German Empire and among Germans in foreign countries.

Its particular purposes are: (1) to rehabilitate the Christian religion among those classes of the people who have become alienated; (2) to suggest, support, and conduct Christian charities; (3) to unite isolated efforts along these lines under a central committee, or to assist them with word and deed. It is a private, voluntary organization, but stands in close touch with the benevolent work of the State.

The organization originated in a *Memorial to the German Nation* by Pastor J. H. Wichern, of Hamburg, in 1848, altho the people had been prepared for the movement to a certain extent by several benevolent activities, e.g., Zeller's reform school, 1820; Amalie Sieveking's care of the sick and wounded, 1831; the deaconess house of Fliepdner, near Düsseldorf, 1836; the prison society of the Rhine and Westphalia; the Gustavus Adolphus society, etc. To quote from the *Memorial*: "The Inner Mission does not mean this or that other particular work, but the sum of labor which arises from loving faith in Christ, which seeks to renew within and without the condition of those multitudes in Christendom upon whom has fallen the power of manifold external and internal evils which spring directly or indirectly from sin, so far as they are not reached by the usual Christian offices with the means necessary for their renewal." It was a passionate appeal to the Church to turn her energies toward every social need, since the causes of all suffering are ultimately reduced to immorality and unspirituality, arguing that the Gospel is the only cure, but that it must be applied to every aspect of life, and that the laity must cooperate with the clergy. The appeal, its reasoning and arguments, closely resembled that of the Christian Socialists in England, and largely contributed to the similar movement in Germany. (See CHRISTIAN SOCIALISM.)

The immediate result of this memorial was the formation of a committee at the "Kirchentag," in Wittenberg, Sept., 1848. The committee met in 1849 and organized the society, incorporated by a special *ordre* of the King of Prussia, Aug. 8, 1849. Wichern was the soul of the movement. He had established the *Raube Haus* at Horn, near Hamburg, in 1833, and cooperated with Pastor Theodor Fliepdner in the establishment of the first deaconess institution among the non-Roman churches, at Kaiserswörth-on-the-Rhine, in 1836. From these beginnings the movement has spread

rapidly. The president's report for 1904 gives a list of 183 societies and institutions more or less closely affiliated with the Central Committee. The larger cities have organized city missions for their particular needs. There are also provincial and State societies in different parts of the empire and elsewhere among Germans. But wherever organized, and whatever special tasks these various societies may pursue, they do not enter politics, or attempt to establish new economic systems, or enter the field of denominational differences, but serve rather as a medium of reconciliation and mutual appreciation. The membership is recruited from all classes of the population, from kings and princes to beggars, and from university professors to peasants.

The older and more important activities of the society are: Houses of Brothers (16), of Sisters (63), for the training of workers; with an income of 8,000,000 marks in 1890. There are in operation: 450 lodging-houses, *Herbergen*; 6,000 schools for men and women in special need of instruction in various lines—conducted on Sundays; 2,220 schools for the care of children; 25 asylums for fallen women (*Magdalenen-Häuser*); 50 day-nurseries; 590 houses for the sick; 430 homes for travelers. Labor bureaus and boys' clubs have been established in nearly every German city; 15,000 situations were provided in 1890. Children are sent to the seashore or to the country from about 130 places.

In a detailed list of various charities we find: *crèches*, *hospitals*, and *schools* for neglected, backward, and abnormal children; *institutions* for idiots, the blind, deaf and dumb, epileptics, etc.; *societies* for apprentices, journeymen, servants—male and female—young men and young women; industrial schools for boys and girls; *homes* and *institutions* for drunkards and immoral men; relief stations; labor colonies; temperance societies and coffee-houses; ethical societies, and children's services on Sundays; the temporal and spiritual care of emigrants, sailors (with a special seamen's mission), canal-boat men, and prisoners; probation societies; the endeavor to bring about a better observance of Sunday, and to procure voluntary nurses during war.

The deaconess institutes have multiplied rapidly. Lately the society has taken up the cause of child and woman labor, and established courses of instruction for police and prison matrons, and schools for housekeepers.

In order to promote Christian life among young men, so-called *halls* or *houses* have been established in connection with various colleges, in which the students receive special religious instruction. For the reclaiming of those who have fallen away from the "faith," instruction courses on "Christian evidences" have been inaugurated; in 1903 the attendance at Berlin was over 400 men and women. A "bureau for the writing, distribution, and procuring of Christian literature" is one of the latest activities of the society. Every attempt is made to bring church news before the public through special papers and the public press. The *Fliegenden Blätter aus dem Rauhen Hause* (since 1844) are the means of communication between the different departments.

The society makes every legitimate attempt to keep its objects before the people. "Extension courses" are given for this purpose in many cities, and teachers, preachers, and State officials are especially invited; lectures are given in smaller places.

The Roman Church in Germany was not slow in availing herself of this movement. She carries on a similar work on a smaller scale under various names, e. g., Society of St. Vincent, Society of St. Boniface, etc.

The President of the society is Dr. Gaebel. Address: Central Ausschuss für Innere Mission, Berlin, W., 35 Genthinerstrasse 38.

RUDOLPH M. BINDER.

INSANITY: The statistics of insanity in most countries are not complete; in many there are no reliable recent statistics, and even in those countries where there are such statistics, the degree of completion of the recent statistics so varies from the degree of completion of former statistics as to make comparison almost useless, and often misleading. General statistics tend to be more and more complete, so that a higher number reported insane may not mean an actual increase, but only a more complete return. Again, in most countries the tendency is on the increase to place the insane in asylums and institutions, where they are much more easily registered than in private homes. Nevertheless, it seems to be the opinion of most statisticians that, allowing for all this, insanity is on the increase in most countries.

According to the census, the insane in the United States in 1890 numbered 106,485, of whom 74,028 were in hospitals. In the Census Special Report issued in 1903, only the insane in hospitals were considered. These had increased to 150,151 in 1906. The number of hospitals for the insane had increased from 162 in 1890 to 328 in 1903. The insane in hospitals had increased from 81.6 per 100,000 of population in 1880 to 118.2 per cent in 1890, to 186.2 per cent in 1900.

The number of insane males in hospitals was 78,523, and females 71,628. In proportion to population there were more white than negro insane. The maximum concentration of age was between twenty-five and thirty-five years. Female insane live longer than male insane, and white insane than negro insane.

Forty-one and six tenths per cent had been employed as laborers and servants before becoming inmates, 22.5 per cent had been occupied in agriculture, transportation, and other outdoor pursuits, and 16 per cent in manufacturing and mechanical industries; 50 per cent were single and 36 per cent married. Of the 328 hospitals for the insane, 226 were public and 102 private. The annual cost of the public hospitals approximated \$21,000,000.

In England and Wales in 1906 there were 121,779 lunatics, of whom 111,256 were paupers and 921 criminals. In 1900 the total number was 106,611 with 97,028 paupers. But while in 1903 there was an increase of 3,251 over 1902, in 1906 the increase was only 2,150 over the previous year. The men number 33.71 per 10,000, and the women 36.80 per 10,000.

The cost of maintaining these lunatics in England and Wales is 14s. 2d. each per week, in Scotland 15s. 10d. For the United Kingdom Parliament makes a provision of £980,570 in payment of the cost of maintenance; the rates provide £2,187,526, and patients pay £311,492.

The total bill therefore is about £3,500,000 yearly.

Of Australia and of the United Kingdom Cogan's "Statistical Account" (1903-4) says, pp. 848-849:

There seems to be little doubt that insanity is slowly but steadily increasing in the states, as it is in the United Kingdom and other countries. In England the rate has risen from 2.75 per 1,000 of population in 1879 to 3.41 in 1902, and in Scotland a similar rise has taken place from 2.75 per 1,000 in 1884 to 3.53 in 1902. In Ireland the rate has risen from 2.50 per 1,000 of the population in 1880 to 4.99 per 1,000 in 1902. The greater part of this increase is no doubt rightly attributed to an improvement in the administration of the Commissioners in Lunacy, by which a more accurate knowledge of the number of cases existent in the country has been gained; but the steady growth of the rate in recent years, when statistical information has been brought to a high pitch of perfection, plainly points to the fact that the advance of civilization, with the increasing strain to which the struggle for existence is subjecting body and mind, has one of its results in the growth of insanity. In all the states of Australasia, with the sole exception of Tasmania, there is seen the same state of affairs as the insanity returns of Great Britain disclose, altho the conditions of life press much more lightly on the individual here.

Victoria has the highest general rate with 3.77 per 1,000. New Zealand coming next with 3.53, closely followed by Queensland with 3.51. Next comes New South Wales with 3.22; South Australia with 2.71; Tasmania with 2.49; while Western Australia shows the lowest proportion with 1.79 per 1,000. New Zealand shows the highest rate for males with 4.03 per 1,000, followed by Queensland and Victoria with 3.91; and Victoria with 3.63 per 1,000 has the largest proportion of females.

Germany had (1897) 151,126 insane—mentally deranged, 98,357, or 65.1 per cent; paralytically deranged, 15,243, or 10; epileptically deranged, 14,135, or 9.4; imbecility and idiocy, 17,844, or 11.8; delirium tremens, 5,547, or 3.7. There are on the whole 2 insane persons in every 1,000 of the population who need treatment in asylums. There were (1900) 394 institutions for the insane, with 87,000 beds, against 199 and 28,300 in 1876. The mortality among the insane was 22.6 per cent. From 45 to 47 per cent are women.

International Statistics.—Professor Mayo-Smith ("Statistics and Sociology," p. 213) gives the following table, but reminds us that it is of doubtful comparative value, owing to the different degrees to which the deficient are registered in different countries:

INSANE FOR 1,000,000 OF POPULATION, 1890

| COUNTRIES | Insane | Idiotic |
|------------------------------|---------|---------|
| Austria..... | 1 1,513 | 2 656 |
| England and Wales..... | 3 357 | |
| Hungary..... | 603 | 1,009 |
| Ireland..... | 3 176 | 1,327 |
| Norway..... | 3 896 | |
| Scotland..... | 2 594 | 1,246 |
| Sweden..... | 1,818 | 1,592 |
| United States..... | 1,697 | 1,526 |
| North Atlantic Division..... | 2,385 | 1,472 |
| South Atlantic Division..... | 1,322 | 1,653 |
| North Central Division..... | 1,647 | 1,634 |
| South Central Division..... | 959 | 1,532 |
| Western Division..... | 1,878 | 648 |

¹ Under insane are included idiots.

² Under idiots are meant cretins.

³ Includes insane and idiots.

There has been great progress in modern times in the care of the insane. Pinel, in 1792, took a great step forward in liberating fifty-three patients at Bicêtre who had been in chains. Franklin, in 1750, succeeded in establishing a department for the insane in the Pennsylvania Hospital.

St. Luke's Hospital in London, established 1751, was the first asylum wholly for the insane; Waldheim, Saxony, was the second, 1787. The

insane are generally housed in large buildings or in cottages, under proper supervision of physicians and nurses. In Belgium and Scotland the custom prevails to put incurables and harmless patients into families, where they lead a natural life, and are encouraged to work. The little town of Gheel, in Belgium, has harbored about 1,300 of these patients annually, and no trouble has arisen.

INSTITUTIONAL CHURCHES: The phrase "institutional church," first used, it is believed, by President Tucker of Dartmouth College, applied to Berkeley Temple, Boston, Mass., has come into use as describing a church that works on all lines of human improvement. Dr. A. Dickinson, pastor of Berkeley Temple, says:

If I were to define it, I should say that it is an organization which aims to reach all of the man, and all men, by all means. In other words, it aims to represent Christ on earth, in the sense of representing Him physically, morally, and spiritually to the senses of the men and women who live in the present age. The institutional church aims to provide a material environment wherein the spiritual Christ can express Himself, and be felt among men as when He was here in the flesh, and it begins by planting itself just where Christ stood and worked when He was on the earth—in the midst of publicans and sinners.

The institutional church does whatever is most needed in the locality where it is placed.

When in an organism, one member does not do its work, other members attempt to perform its functions. The institutional church may be said to be the church performing for portions of the community the functions not performed for them by the home and society at large. In communities of homes, the institutional church has little place. In tenement districts it provides clubs, social, educational, literary, and gymnastic. Among the very poor it provides charities; in communities engaged largely in manual labor, baths and recreation; in boarding-house districts, educational classes. In a thoroughly mixed population the institutional church works by every method. An illustration of the latter is St. Bartholomew's Church (Protestant Episcopal) in New York City. It spends on its Parish House activities some \$100,000 per year and provides services in a variety of languages, including Syriac and Armenian. It has clubs of every kind—glee clubs, literary, physical culture, social clubs, debating societies, penny provident and mutual benefit funds, classes in dressmaking, millinery, cooking, stenography, typewriting, French, book-keeping, etc. The Parish House has a roof garden on top of nine busy stories. It maintains a country holiday house, a fresh-air fund, a tailor shop, clinic, loan association. In one year it found work for 2,559 applicants. It has eighteen services on Sunday and most of the year 194 meetings of different kinds in the week. It has 2,146 communicants; 5,000 in a year have professed to live this new life.

Morgan Chapel, Boston, is an example of what can be done, not with \$100,000, but with \$3,500. This includes entire expense for fuel, lights, janitor, pastor's salary, assistants, etc. Yet it supplies reading-room, baths, a school of handicraft for printing, cobbling, tailoring, dressmaking, carpentry. It has a medical mission, day nursery, kindergarten, employment bureau, free concerts, instruction in music, etc.

The Judson Memorial Church (Baptist), and Trinity Church, St. George's, Grace Church, the Ascension, St. Christopher's, St. Michael's, the Pro-Cathedral (all Protestant Episcopal), are

well-known institutional churches in New York. The Jersey City Tabernacle (Congregational) makes a specialty of recreation, furnishing it in thirty different forms. The Baptist Temple, Philadelphia, has a hospital, the Samaritan, treating 6,000 cases in one year, and a unique Temple College, with thousands of students in thirty-two courses, from the kindergarten to a law school and theological seminary. Westminster Presbyterian Church, Buffalo, has a social settlement with eight resident and eighty non-resident workers. Pilgrim Church, Cleveland (Congregational), was perhaps the first to embody the institutional idea in a beautiful new building adapted to it. The Fourth Avenue Baptist Church, Pittsburgh, Pa., has among other things a Toy Mission, where second-hand toys are distributed to poor children at Christmas. In successive years it has provided for 25, 200, 1,600 and 3,600 children. The Ninth Street Baptist Church, Cincinnati, has seven chapels, at each of which institutional work is carried on. The Union Church (Congregational), North Brookfield, Mass., has recently shown what can be done in a village. Its Enterprise Club discuss and has been influential on public questions. A Historical Society, the Union League for Boys, Guild of the Helping Hand for Girls, the Manse Literary Club for young women, met different needs. The pastor found it easier financially to meet all these expenses than to keep them going without these.

It is, however, to be remembered that good done is not always to be measured either by the number or extent of instrumentalities. These churches are not therefore selected because of necessity they are doing the most good, but because it is abundantly proven that instrumentalities, *with the right spirit*, and wisely suited to local needs, do abundantly help, even as Christ gave the bread of earth, together with and as symbol of the bread of heaven. Dr. Robbins, pastor of the Lincoln Park Institutional Baptist Church, Cincinnati, writes us: "You will be pleased to know that the spiritual results have been largely increased by our methods of work. Notwithstanding the innumerable difficulties in this down-town field, we have received, during my pastorate of this church (sixteen years), 1,422 new members, of which 1,021 were by baptism." The success of the Pilgrim Congregational Church, Cleveland; of the Baptist Temple, Philadelphia; of the great Protestant Episcopal institutional churches in New York City and elsewhere is well known. The year when the Methodist Church in the world lost 20,000 members, Morgan Chapel had more conversions than in any one of its previous fifty years. The average institutional Congregational Church gained in one year just six times as many additions on confession of faith as the average Congregational Church. In the Miami Association (Baptist churches of Cincinnati and vicinity) two institutional churches had 209 additions on confession of faith; twenty-one churches working on old lines had 116.

We give on page 630 detailed information as to thirty churches carrying on institutional activities. It is to be noted, however, that all these churches do not call themselves "institutional," and that many churches not here listed do carry on activities truly "institutional," in some instances quite as important and extensive as some here named. In fact, there are few churches to-day in the cities of the U. S. which do not in some way

INSTITUTIONAL CHURCHES

The latest tabulation of the activities of typical churches

| No. | Church | Denomi- nation | Year of start- ing in- stitu- tional work | City | Street | Pastor |

¹ Managed by joint committee of Unitarians and Methodists. ² Several have kindergartens and day nurseries. ³ Coopera-
tive stores, People's Forum. ⁴ Including church, \$20,000. ⁵ Rifle range, roof-garden theater, dancing-school, wood-yards,
bowling-alley. ⁶ Home nursing. ⁷ Millinery, dressmaking. ⁸ Some report different individuals; some do not. ⁹ Orphanage,
home for aged women, summer home. ¹⁰ Church, \$17,000. ¹¹ Free school and later other activities. ¹² 1896 parish house.
¹³ Clinic. ¹⁴ Clothing bureau, sewing rooms, cemetery. ¹⁵ Kindergarten classes. ¹⁶ Bowling-alley, club, etc. ¹⁷ Commons.
¹⁸ Coffee-room. ¹⁹ Hospital, 100 beds, college, 4,000 regular students and 3,000 more at lectures. ²⁰ 11 in church, 223 in col-
lege, 59 in hospital; orphanage, 7. ²¹ Employment bureau.

carry on at least one or more activities which might be called "institutional." In New York City alone, in 1900, out of 488 Protestant churches, 112 were carrying on direct institutional activities and almost all doing something in this line. Of the 112, forty-two were Protestant Episcopal. It is said to-day in the diocese of New York that there is not one Protestant Episcopal church which does not carry on at least some such activities.

In Great Britain churches have been taking on similar activities yet usually under other names in different ways. (See **CHRISTIAN SOCIALISM**; **CHRISTIAN SOCIAL UNION**; **CHURCH ARMY**; **FREE CHURCHES**; **PLEASANT SUNDAY AFTERNOON**. For the Continent, see **CHRISTIAN SOCIALISM**; **INNER MISSION**; **ROMAN CATHOLIC CHURCH AND SOCIAL REFORM**.

INSURANCE (see also **INDUSTRIAL INSURANCE**):

Insurance may be defined as a contract of a company or person to pay a sum or sums of money to indemnify the insured, or a designated beneficiary, in case of loss through the happening of certain events which constitute the risk insured against.

Insurance is mainly a modern development, tho it originated in the remote past. It was known to the ancients, but was chiefly developed by more recent mercantile adventures, men agreeing to divide among themselves the burden of the loss of ships or cargoes in the days when commerce was the fitting out of ships for single, long expeditions. This custom arose in England in the Elizabethan era, but had appeared in southern Europe earlier than that.

Insurance depends on the law of probabilities, it is said, developed about the year 1650, when the Chevalier de Mere, a Flemish nobleman, who was both a respectable mathematician and a gamester, attempted to solve the problem of dividing equitably the stakes when a game of chance was interrupted. He sought the aid of the famous Abbé Blaise Pascal, one of the most accomplished mathematicians of any age. Pascal solved the problem, and in doing so enunciated the "doctrine of probabilities," or laws governing so-called chances.

This doctrine or theory Pascal illustrated by the throwing of dice. When a single die is thrown, the chance of turning up an ace is precisely one out of six, or one out of the total number of sides or faces. But if a large number of throws are made, it will be found that each face will be turned

Law of Probabilities

up an equal number of times. From this Pascal laid down the proposition that results which have happened in any given number of observed cases will again happen under similar circumstances, provided the numbers be sufficient for the proper working of the law of average. Thus the duration of the life of a single individual is one of the greatest uncertainties; but the duration, or rate of mortality, of a large number of individuals may be predicted with great accuracy by comparison with the observed results among a sufficiently large number of persons of similar ages, occupations, and climatic influences.

From this principle insurance has developed on a scientific basis. It is of many kinds. Fire-

marine-, and life-insurance are the best known; but accident, liability, plate-glass, steam-boiler, elevator, burglary, sickness, guaranty, mortgage and title, hail, and live-stock insurance have each reached large proportions. Many other branches of insurance have been suggested, and in some cases attempted, among which are: Insurance against loss of occupation; insurance of premiums paid for stocks or bonds, which are subject to redemption; insurance against issue and survivorship; insurance of marriage portions for daughters; insurance against divorces; insurance against celibacy.

The earliest form of insurance was by means of individual underwriters, each one assuming a fixt proportion of the aggregate amount fixt. In London the venturesome who took part in this underwriting used to meet at Lloyd's Coffee-house, from which fact the name of Lloyd's was given to this form of insurance. But, as a general thing, insurance is carried on by corporate companies which are either mutual or stock, and which are subject more or less to government supervision.

Fire-insurance seems to have been the first to develop its modern form. A regular office for insuring against fire was opened in London in 1681, the great fire of 1666 being the exciting cause. The first office in the U. S. was established at Philadelphia in 1752, one of its early directors having been Benjamin Franklin.

The extinguishment of fire is commonly undertaken by municipalities, tho fire-insurance companies often sustain patrols to care for property. (See **FIRE DEPARTMENTS**.) In the U. S. fire-insurance has been greatly developed.

The fire-insurance companies underwent a very severe test successfully in the San Francisco disaster of 1906. They paid claims exceeding \$150,000,000, with only two important failures of American companies and two or three of German companies. Tho their policies did not cover against earthquake and were void by their terms when the building fell, most of them did not defend on this ground, but paid in full, while the rest compromised. They did not behave so liberally toward property-owners who suffered at Valparaiso, Santiago, Kingston, and other points. The lessons of these disasters indicate the desirability of the following reforms, which have already been mooted:

1. Policies should definitely cover against sudden destruction of property by fire, lightning, explosion, collapse, earthquake, wind-storm, or flood.

2. Reserve laws should be amended so that all above what is barely necessary for solvency will be available to pay conflagration losses.

Life-insurance, tho starting later, has reached a higher state of development than fire-insurance. It began at near the first of the eighteenth century.

The Grand Pensioner DeWitt, of Holland, was the first to reduce these theories to practise, which he did in 1693, by calculating the true values of annuities, based upon observed rates of mortality. Dr. Halley, Astronomer Royal of Great Britain, was the first to discover and arrange what are called life-tables from which all monetary values depending upon the chances of living and dying, combined with the improvement of money by interest, may be computed. He has been called the father of the mod-

ern system of life-insurance. These tables have now only an historical interest.

About the close of the seventeenth century there were also several annuity schemes launched, but the first life-insurance company was the Amicable Society, chartered in 1706. In 1762 the Equitable was chartered, and began issuing policies payable at death, upon the lives of persons of any age, charging premiums according to age; but solely a business for short terms, and a whole life business. In the U. S. the Presbyterian Ministers' Fund of Philadelphia was chartered in 1759 by Thomas Penn, for the insurance of Presbyterian clergymen.

Life-Insurance

In 1812 a company called the Pennsylvania was chartered; in 1830 the New York Life-Insurance and Trust Company, which is still in existence, but does no life-insurance business. The Mutual of New York, the first of the mutual companies, was organized in 1842, and from 1845 to 1860 many new companies were organized. In 1856 the State of Massachusetts originated a system of state supervision, and it was immediately followed by the State of New York. The Massachusetts department adopted the Seventeen Offices, commonly known as the Actuaries' Table, as its standard; and the New York department, the American Experience Table, which was a modification of the Seventeen Offices Table, in the light of experience of the Mutual Life-Insurance Company.

Life-insurance companies nowadays issue a variety of immediate and deferred annuities, temporary and whole life-insurance, the latter often paid for by a limited number of payments; and a large variety of endowment, tontine, and other investment policies. The companies are mutual, proprietary, or mixed, according as all the savings and profits belong to the insured or all belong to the stockholders, or stockholders receive a part and the policy-holders the remainder. Mutual companies alone have no capital stock. While nominally the members control mutual companies, their practical operation makes the managers all-powerful. The new laws of New York hereinafter referred to, and which have been followed by the legislatures of some other states, now provide for a system of direct voting by mail under which nominations are made by the administration and also independent nominations, and the ballots are cast directly by the members.

Originally the companies did not give cash or other surrender values for their policies. It was made compulsory for Massachusetts companies to do so by a state law early in the sixties, and not long after it was also made compulsory for New York companies to give paid-up insurance upon surrender; notwithstanding which, by waiving the law, several companies set out on a career of tontine policies, which were originally wholly forfeitable, but which held out to a persistent policy-holder hopes of very large profits if he survived and sustained his policy. These hopes, however, were not realized and gradually the tontine principle has been abandoned until now the State of New York has wholly prohibited the issue of deferred dividend policies, and several other states have done the same. It seems likely that it will be wholly abandoned in the U. S.

One result of the reaction from cash-surrender legislation which took the form of tontine insurance was the organization of a large number

of mutual-assessment life-insurance associations. More than one half of all the life-insurance now in force in the U. S. is in these organizations, and many more than one half the number of persons carrying insurance. They have furnished insurance on three different plans—viz., first, by assessing the same amount on members without regard to age, whenever there were losses; second, by assessing according to certain ratios fixed at age of entry; third, by assessing according to certain ratios according to the actual age attained at time of assessment. Associations using the first of these systems have nearly all gone out of existence. Associations using the second, which came later into use, are now having an unpleasant experience, and are likely to be driven out of existence unless they reform their plan.

Theoretically the third method is feasible, but in practise it has proved that the companies using it are sure to have very serious adverse selection, as the members grow older, and consequently, that it is not feasible beyond perhaps about age sixty.

Most of them, however, seek to create a level price in spite of the increasing cost by charging more than the insurance costs during the earlier years, with a view to offsetting the increased cost during the latter years. The success of such associations will depend upon the adequacy of this provision. The management of the associations is commonly much more democratic and truly mutual than that of the regular companies, altho some of them are managed in quite as autocratic a manner. Those which operate on the lodge system are, however, all managed on the representative plan, the members electing delegates to state and national conventions which legislate for the association and elect its managers. (See **FRATERNAL SOCIETIES.**)

Several of the older and stronger of these societies have readjusted their rates in recent years, adopting straight level-rate plans, and in some cases preparing to hold ample and sufficient reserves to maintain the same. In other societies this has not been the case, but a makeshift measure has been employed, the rates, tho increased, being still inadequate.

During 1905 and 1906 a famous investigation of life-insurance companies by a committee of the New York State Legislature, known as the "Armstrong Committee," with Charles E. Hughes as chief counsel, was made. The investigation disclosed the fact that a large number of evils had grown into the management of these companies, and the character of the evils and the remedies therefor are sufficiently indicated by the following synopsis:

The investigators found conspiracies to use the funds of these great companies in controlling other corporations; they prohibited investments in stocks or in "collateral trust" bonds, under which such control could be exercised.

They found "joint accounts," "underwritings and syndicates"; all are prohibited now.

They found directors causing companies to invest where they were themselves interested; every such abuse of trust was interdicted.

They found secret political contributions with the implied consideration "we look after our friends"; now no corporation may make such contributions.

Abuses of Trust Funds

They found "yellow-dog" funds, evidences of corruption of legislators and waste unexampled, without accounting or responsibility; they left a law regulating such services and expenditures and calling for complete publicity.

They found extravagant salaries and emoluments, nepotism, sinecures, often without a knowledge of the directors;

they prescribed that the compensation of any man, firm, or corporation, totaling more than \$5,000 in any one year, must be voted by the directors.

They found false entries and false reports to departments; they penalized not merely the making of such but the omission of anything which is required by law.

They found perjury so common and so difficult to prove that men dared swear to contrary statements concerning the same thing, secure unless one could prove which was false; they made this conflict of statement "presumptive proof" of the crime.

They found an actuary of the department on the pay-roll of a company supervised by it. This is now a misdemeanor.

They found life companies of the state which were rarely, almost never, examined by the department. Now each must be examined every three years.

They found that assessment concerns could become legal reserve companies without readjusting the old business on a sound basis. This can be done no longer.

They found false statements of results, lying estimates, and misleading forms of policies that were the chief reproach of the business. Now each and all are proscribed.

They found no enabling statute for the incorporation of mutual life-insurance companies, but, instead, a wide-open provision for incorporating them on an unsound basis; this is now reversed, the assessment act has disappeared, and regular mutual companies may be organized.

They found "deferred-dividend" policies, despite the bitter disappointment of virtually all who had taken them, being thrust upon nearly every applicant by means of seductive "illustrations" and discriminating commissions; they left the field to honest annual dividends exclusively.

They found a false standard of solvency which had ruined scores of really solvent companies, and a very necessary evasion of it which alone had enabled many really solvent companies to live; they destroyed the false standard and the evasion and they set up a true "minimum standard" which secures solvency, discourages extravagance, and conserves the sources of dividends.

They found the companies unlimited as to what they could withhold from distribution to the policy-holders; they introduced salutary limitations to the "contingency reserves."

They found "apportionment" of surplus by policy years ending at all sorts of days in the calendar year, a very hodgepodge with "guessing" all but inevitable; they substituted true "distribution" of the ascertained earnings of the calendar year, an open, intelligible process.

They found surrender value laws which were inoperative unless the policy-holder applies within six months after lapse; now, under like conditions, the policy is automatically continued as extended insurance and the family is protected.

They found elections in mutual companies a mere farce, invariably controlled by proxies held by the officers; they introduced an election law, under which, recently, more than 800,000 policy-holders cast their ballots in the two great mutual companies, and so freely express their choice that each side had literally hundreds of thousands of votes.

They found administrations callous and indifferent to policy-holders' just protests; they created conditions which render administrations promptly responsive to the policy-holders' desires.

They found an insatiable and irrational thirst for "volume" of new business; they imposed wholesome restraints to temper it until under control.

They found the mad chase for new business carried on without regard to expense; waste and extravagance abounding here as in no other part of the business; they restrained this within the bounds of a small allowance over the cost of new business, the most economical companies.

They found a bewildering confusion and variety of policies offered by the companies, all drawn by their attorneys with a view to gain some advantage in competition; these they replaced with "standard forms," simple, fair, easy to comprehend, drawn for the policy-holders by Charles E. Hughes.

They found companies doing a non-participating business at a loss, which fell upon participating policy-holders; hereafter New York companies must do one or the other, and cannot do both.

They found annual reports defective, in that full publicity was not secured as to:

1. The facts regarding real-estate holdings and their yield. Much deception had been practised here.

2. The movement of securities during the year. Scandalous substitutions had been hidden for want of this.

3. The items as to commissions on the purchase or sale of property or on loans and as to legal expenses. Here "graft" was concealed.

4. The items of legislative expenses, with dates and notes and "for what?" Here the "yellow dog" had gorged himself.

5. Information as to the last election of directors. This had been carefully withheld.

6. Salaries of officers and directors and all compensations in excess of \$5,000 during the year. Here "nepotism" and "graft" had been rampant.

7. The largest balances in any bank or trust company. Here the control over funds had served individual ends.

8. The facts about resisted and comprised death-claims. Carefully suppress heretofore.

9. Profits and losses for the year, with the profit and loss on new business set forth separately. The New York department, obedient to the companies, had always opposed anything of this sort.

10. Rates of annual dividends for the year for all plans and durations and for four representative ages. Common honesty calls for it. Great Britain had required it for thirty years, but we were derelict.

11. Rates of deferred dividends actually paid during the year. "Illustrations" were in use showing larger figures than actual results in the same company.

12. Rates of accumulations of deferred dividend surplus, for all plans and durations and for four representative ages. No sort of accounting had hitherto been required.

All these and more were incorporated in the requirements of the annual report.

The investigation, in addition to bringing about these reforms in the laws and in the practices of companies, also caused the resignations of the presidents of all three of the largest New York companies and of several other officers who were involved in the irregularities complained of. (See CORRUPTION.)

Similar investigations were carried on during 1906 as follows: New Jersey, Indiana, Wisconsin, and Iowa, and the Dominion of Canada, and in each case legislation was recommended resembling more or less remotely the new laws of New York. In addition, a committee composed of insurance commissioners held repeated sessions during the year and recommended a series of bills, known as the Committee of Fifteen bills, covering many of the same subjects. Several states have enacted these bills into law, either without modification or with slight modification.

The various investigations did not deal with industrial insurance as a system; but in Massachusetts during the years 1906 and

The Present 1907 various efforts were put forward to introduce a system of industrial insurance in connection with savings-banks, to be carried on without the heavy expenses which attach to the weekly collection business. It met with a great deal of opposition, both on the part of the savings-banks and of the industrial companies, but a law was passed providing for it. It is also very doubtful whether any very large proportion of the industrial business could be held, were there no weekly collection system.

Unquestionably, the insurance problem of this day is to secure good, reliable insurance for the poor at a moderate cost. No one needs insurance as do the poor. They seldom save and often cannot save. When sickness or death enters the family it causes financial anxiety and suffering from which insurance should protect them. Possibly the industrial companies are doing as well as could be expected under the circumstances. It cannot be said that their collectors, as a rule, are making more than living wages. The companies also have voluntarily admitted the policy-holders to the benefits of paid-up insurance values on surrender to which they were not entitled by their contracts, and have disbursed very large sums of money in dividends to policy-holders, also not called for by the contract.

Marine-insurance began in England very early. In the U. S. the first record of it is in 1757 in New York City. In 1794 the Insurance Company of North America was organized to do a marine and fire business. Sickness insurance

was attempted from 1845 until 1850, but failed of success, there not being sufficient data to work upon. It is now again being undertaken with better prospects. The

Marine-Insurance

The first accident-insurance company was the Travelers, of Hartford, organized in 1863, which has been successful from the start. Live-stock insurance began in Connecticut in 1866. In the same year the Hartford Steam-Boiler Insurance Company was organized. In 1872 the Guarantee Company of North America began the business of surety insurance, with headquarters at Montreal. In 1876 the Real Estate Title Insurance and Trust Company, of Philadelphia, was organized. Liability insurance did not become popular until about 1890, and burglary insurance only within the last two or three years. Credit insurance has been widely patronized during the last ten years. (See also INDUSTRIAL INSURANCE.)

Europe

The recent history of insurance in Europe lies in the development of State and of compulsory insurance. Insurance some consider the most socialistic form of modern business, since its essence is security for the individual by dividing losses over the community. Undoubtedly the future of insurance is involved with that of socialism. The agitation for old-age pensions (*q. v.*) clearly indicates this.

In several countries, notably Switzerland and Norway, there are State fire-insurance companies competing with the stock companies for business. In England there is a system of government annuities. In New Zealand there is an exceedingly successful governmental life-insurance department which does about half the business of that colony, and which now has aggregate assets of more than \$10,000,000. This company also has operated in competition with proprietary and mutual corporations. (See NEW ZEALAND.) The State insurance companies, with the exception of the English annuities, have been almost uniformly successful; but it cannot be said that in the majority of cases they have furnished materially cheaper or more reliable insurance than have private corporations.

It is believed that this phenomenon is explained by the fact that they are competitive and not monopolistic institutions. As a result of their competitive nature, they are compelled to incur practically all the expenses that are incurred by stock corporations.

Wherever insurance has been made a State monopoly, as is the case in the compulsory insurance of Germany, it has been found that it can be conducted with great economy. Even in Germany working men are permitted to exercise the option of insuring in private companies, but the fact of compulsion operates there to make the State insurance practically monopolistic. (See INDUSTRIAL INSURANCE; also INDUSTRIAL INSURANCE, STATE, OF THE GERMAN EMPIRE.)

What might be accomplished in the way of furnishing cheap insurance through the means of compulsion in a democratic State might be imagined by the following statement from the *Insurance World*:

Mr. Leslie (Assistant Actuary Government Insurance Department of New Zealand) recently published a study of "The Rates of Mortality in New Zealand," covering the mortality according to the census, which compilation is the best and most practical thing of the sort that has come to our

attention. It also shows that a mortality table constructed with great care from the data which the census-takers collected is not merely more favorable than the tables constructed from the census of any other country, but also more favorable than the experience on insured lives in any compilation, except in that of the Australian Mutual Provident Society. Indeed, so low is this experience that it shows that all the male citizens of New Zealand could be insured from age twenty at a net rate of but \$10.96 per \$1,000 if compulsory insurance existed, *all being taken without regard to state of health*. Such a favorable opportunity to test the virtues of compulsory insurance by the State will probably not be long neglected, especially as the machinery of State insurance is ready for it. The rate for women would be slightly lower than even these figures.

The cost of administration could not be great, and it is probable that this insurance could be furnished at a total cost of not exceeding \$12 per \$1,000 without taking into account the fact that higher rates of interest than 4 per cent, upon which the rate is based, would be for a long time obtained. It must be taken into account also that this compulsory system would furnish to a very large part of the population whose health condition now prevent their obtaining insurance, a protection of which their families stand in need. This beneficent thing would be accomplished not at an increased cost to the healthy and robust, but instead at a diminished cost.

But this is not all. With the introduction of compulsion all necessity for a reserve disappears. The reserve in life-insurance is for the purpose of supplementary future premiums when the same become less than the cost of insurance. If a compulsory system were adopted, this equalization would be brought about by collecting from each productive member of the community, without regard to age or health conditions, his quota of the aggregate losses. Actuaries agree that this would be entirely practicable on the basis of compulsory insurance, altho entirely impracticable when the young and healthy are free to enter or not, as they choose. The effect of this would be that probably all persons in New Zealand, for instance, could be permanently supplied insurance at a cost not much, if any, exceeding \$12 or \$13 per \$1,000. As the New Zealand insurance department already supplies conveniences for monthly and for four-weekly payments without adding any considerable sum for the additional expense, there seems to be no reason why this experiment should not be tried by this colony, which is already so far ahead of the rest of the world in socialistic enterprise.

MILES M. DAWSON.

Fraternal Societies

In 1905 there were in the U. S. 87,758 lodges with 5,111,480 members (4,879,412 being full members).

Jan. 1, 1905, they had \$6,665,141,251 of insurance in force; assets of \$51,465,430, and liabilities of \$9,619,089. The oldest dated from 1868.

II. Industrial Companies

| | 1890 | 1900 | 1904 |
|--|-----------|------------|------------|
| | £ | £ | £ |
| Premiums..... | 5,031,826 | 9,296,047 | 11,093,268 |
| Consideration for annuities..... | 75 | 6,986 | 3,846 |
| Interest (less tax)..... | 274,563 | 676,180 | 934,766 |
| Net increase in value of investments..... | | | |
| Miscellaneous..... | 2,127 | 63,965 | 84,737 |
| Total..... | 5,308,590 | 10,043,178 | 12,116,557 |
| Claims..... | 2,184,851 | 3,866,537 | 4,255,966 |
| Cash bonuses and reduction of premiums..... | | 960 | 342 |
| Annuities..... | 1,134 | 7,858 | 12,090 |
| Surrenders..... | 12,534 | 38,059 | 79,775 |
| Management (including commission)..... | 2,221,889 | 3,946,893 | 4,827,650 |
| Dividends, bonuses, etc., to shareholders..... | 53,901 | 477,263 | 557,282 |
| Net decrease in value of investments..... | 463 | 8,865 | 3,490 |
| Miscellaneous..... | 141 | 845 | 8,445 |
| Total..... | 4,474,913 | 8,347,280 | 9,745,640 |
| Paid-up capital..... | 519,744 | 1,670,290 | 1,951,014 |
| Life and annuity funds..... | 8,873,082 | 20,478,503 | 28,544,634 |
| Reserve funds..... | | 850,000 | 1,540,793 |

Both these tables show a remarkable increase of receipts, that is, of about 90 per cent: the outgo was slightly more. The industrial companies had even better success, since the receipts increased over 110 per cent, and the outgo in the same ratio. The paid-up capital of the latter more than trebled in nearly twenty-five years; life and annuity funds increased nearly 350 per cent; while the reserve funds increased over 90 per cent within four years.

GERMANY

There are a number of insurance companies in Germany doing business apart from the compulsory insurance of the State (see INDUSTRIAL INSURANCE); these companies are, however, supervised by the State.

Life-insurance companies number 39—28 stock companies and 11 "mutual" companies, aside from a number of small concerns of a purely local character; 23 stock companies had in Dec., 1903,

about 28,000 policies in force; 12 mutual societies had 22,548 policies. The income in 1903 of 26 stock companies was 254,212,000 marks, expenses 221,517,000; that of 21 "mutual" societies 219,460,000 and 179,207,000. The income of 9 "people's" companies was 62,507,000; expenses, 52,040,000.

Fire-insurance is engaged in by 33 large stock companies and 16 mutual companies. The former had an income in 1903 of 126,133,000; expenses, 106,584,000; the latter, 30,821,000 and 13,304,000. All of these companies usually engage also in hail, flood, and burglary insurance.

INTEMPERANCE: For a discussion of the various ways of dealing with the social problem of intemperance, see CENTRAL PUBLIC-HOUSE TRUST ASSOCIATION; COFFEE-HOUSES; HIGH LICENSE; LOCAL OPTION; LOCAL PROHIBITION; NATIONALIZATION OF THE LIQUOR TRAFFIC; NORWEGIAN COMPANY SYSTEM; PROHIBITION; DISPENSARY SYSTEM. For the history of the temperance movement, see TEMPERANCE. For the extent of the traffic, see LIQUOR TRAFFIC. For a discussion of how far intemperance is the cause of poverty and crime, see POVERTY.

We present here various statements as to the evils of intemperance from well-known students of the question:

Of drink in all its combinations, adding to every trouble, undermining every effort after good, destroying the home and cursing the young lives of the children, the stories tell enough. It does not stand as apparent chief cause in as many cases (of pauperism) as sickness or old age, but if it were not for drink, sickness and old age could be better met. Drink must therefore be accounted the most prolific of all the causes, and it is the least necessary.—*Charles Booth, in his book on Pauperism and the Endowment of Old Age* (pp. 140, 141).

"The destruction of the poor is their poverty," and the present licensing system is a chief cause of the present-time poverty, debasement, and weakness of the poor.—*John Burns, M.P., and 139 other British labor leaders, in an address supporting the Veto bill in 1893.*

For myself, twenty-one years of study and observation have convinced me that poverty is a prime cause of intemperance, and that misery is the mother and hereditary appetite the father of the drink hallucination.

To the labor reformers I have to say, you have united for home protection; so have we. You will bring it about by standing together at the ballot-box; so shall we. In the slums they drink to forget; we would make life something they would gladly remember. We once said intemperance was the cause of poverty; now we have completed the circle of truth by saying poverty causes intemperance, and that the underpaid, underfed, underbattered wage-earning teetotaler deserves a thousand times more credit than the teetotaler who is well paid, well fed, and well cared for. Our objects are the same. Let us clasp hands in the unity of the spirit and the bond of peace.

Ten years ago I could not have said it honestly, five years ago I could not have said it helpfully, but now I fearlessly declare that I believe it to be the right and duty of white ribbon women to help abolish poverty in the largest sense of that great phrase; but I must in the same breath ask our friends of the labor movement to recognize that our special work for the abolition of poverty consists in the abolition of the public house and the saloon.—*Frances E. Willard, in her presidential address before the World's W. C. T. U., in London, June, 1895.*

If I could I would inaugurate a strike that would drive the liquor traffic from the face of the earth.—*P. M. Arthur, Chief of the Brotherhood of Locomotive Engineers, in a speech at Cleveland, Ohio, March 28, 1886.*

The liquor traffic is responsible for nine tenths of the misery among the working classes, and the abolition of that traffic would be the greatest blessing which could come to them.—*T. V. Powderly, ex-General Master Workman of the Knights of Labor.*

I have looked into a thousand homes of the working people of Europe; I do not know how many in this country. I have tried to find the best and the worst; and while, as I say, I am aware that the worst exists, and as bad as under any system or as bad as in any age, I have never had to look beyond the inmates to find the cause; and in every case, so far as my own observation goes, drunkenness was at the bottom of the misery, and not the industrial system or the industrial conditions surrounding the men and their families.—*United*

States Commissioner Carroll D. Wright, in an address on the Relation of the Modern System of Industry to Intellectual Development (1895).

If I could have my way I would wipe out every saloon. The saloon is the prolific source of nine tenths of the misery, wretchedness, and crime, and is, more than we know, responsible for the social evil.—*Rev. Charles H. Parkhurst, D.D., in an interview in The Voice of Jan. 16, 1896.*

After all, if we hunt vice and crime back to their lairs we will be pretty sure to find them in the gin-mill. Drunkenness is the prolific mother of most of the evil-doing. . . . Drunkenness is the prime cause of all the trouble.—*Thomas Byrnes, while Superintendent of the New York Police Department.*

The relation of the liquor traffic to economics, says James C. Fernald in his "Economics of Prohibition," is one which the masters of the science have scarcely begun to touch. He says:

Liquor selling does not pay. . . . Tell the lumberman of Michigan how many thousands of drinking farmers will shingle their homes and barns, or build new ones, as soon as they "quit their meanness," and how many thousands of houses will be built in all our suburbs for the working men when none of them drink away the money that might pay the rent, or buy the cottage. Show the shoe manufacturers of Massachusetts what it means to take all the bare feet of drunkards' children off the ground. Let the iron men of Pennsylvania know that new stoves will be at once needed in a hundred thousand homes, when the saloon-keeper ceases to get the money. Tell the miners they will have work all winter through, getting coal enough to put into those stoves. Tell the cotton-planters of the South that there will be about 10,000,000 new calico dresses and aprons wanted as soon as the 2,000,000 tipplers cease to tipple, and go home with some spare change. Let the ranchmen of Dakota and New Mexico, and Armour's men in Chicago, know that there's going to be beef on thousands of tables, where now are a few cold potatoes, as soon as we can carry Prohibition. Tell the wool-grower of Ohio that everybody in this country is going to be wrapped in woolen and sleep under blankets when the blizzard blow and the thermometer ranges about zero, and men no longer heat up with liquid fire in order to exterminate their families with atmospheric cold. Tell the grocer he can sell for cash, and say good-by to bad debts, when the dimes no longer go into the saloon till. Tell the farmer there is going to be an unheard-of demand for flour and meal, and butter, and cheese, and eggs as soon as the bloated beer-holders cease fostering that industry, and begin filling out the hollow cheeks of wives and children.

As to the relation of drink to crime, a careful investigation was made by Carroll D. Wright when he was in charge of the Massachusetts Bureau of Labor.

He analyzed the crimes committed in Suffolk County, which contains the city of Boston, for the year ending Sept. 1, 1880. The total number of sentences passed during the year was 16,897, of which 12,289, or 72 per cent, were for offenses clearly due to drink, 12,221 being for drunkenness and 68 for illegal sales of liquor. Of the remaining 4,608 persons convicted of various crimes, Mr. Wright found that 2,097 had committed them while under the influence of liquor, and that the intent to commit the crime was formed by 1,918 while under the influence of liquor. It was found in 1,804 cases that the crime was committed under conditions induced by the drinking habits of criminals, while in 821 cases the drinking habits of others induced the crime condition.

If the 2,097, who were shown to have committed their offenses while under the influence of drink, be added to the 12,289 convicted of "distinctively rum offenses," this makes 14,386 out of the total 16,897 commitments, or 84 per cent, due to drink particularly.

Prof. J. J. McCook, of Trinity College, Hartford, Conn., in a paper read before the Twentieth Century Club, of that city, in 1895, speaks of the relation of drink to crime in these words:

For twelve years the police arrests for drunkenness alone averaged in Hartford 62.8 per cent of the whole number, while the drunkenness and its allied offenses numbered 80.67 per cent. This proportion is perhaps somewhat larger than in most places, but it may generally be expected to be at least as high as thirty-fifths.

Ninety-five to ninety-seven out of every hundred incarcerated in our jail are self-confessed drinkers, altho they pleasantly add "moderate" to the title; and from 43.6 to 56.1 per cent of them are there specifically for drunkenness, and fully 66 per cent, or two thirds of them, are there for that and its resulting crimes. There were 1,393 of them there last year out of a total of 2,111.

Of the 381 captives in our state prison last year, 46.8, or almost half, thought drink had done it.

Take special phases of crime, for example: Abuse, neglect, or abandonment of children. Those most familiar with the subject in this neighborhood have put the proportion of cases attributable to drink at or beyond two thirds. From the Pennsylvania Society to Protect Children from Cruelty, with headquarters in Philadelphia, a former vice-president, in talking with me, fix the proportion roughly at four fifths to nine tenths. But the secretary gives me definite statistics for 1891-92, showing 309 cases of drink out of a total of 864 in 1891, and 359 out of 987 in 1892, i. e., from 35.8 per cent to 36.4 per cent. In some previous years the percentage had been as high as 50.

Take murder and homicide. During the months of January, February, and March of last year I clift from three daily papers here every case of murder and homicide and classified them according to assigned causes. In a very large proportion no cause was given. All such were reckoned as not due to drink—which is, of course, conceding far too much—and drink was charged only when definitely assigned. In January there were 31 cases, of which 9 were due to drink; in February there were 67, of which 10 to drink; in March, 41, of which 10 to drink. The total was 110, with 29 cases, or 26.9 per cent, specifically attributed to drink.

The business men of the country recognize the importance of having sober men. *The Voice* has collected information from leading officials of forty-five railroads, having some 200,000 employees. Without exception, all agreed that, from their business experience, "habitual drinking makes employees less efficient in their work." In reply to the question, "Does your company forbid the use of intoxicants to employees while on duty?" all, without a single exception, replied that they did. (See also LIQUOR TRAFFIC.)

INTEREST, as the word is popularly used, may be defined as the price paid for the use of money. In exacter thought it is the price paid for the use of *capital* (money or any other form of capital). It is identical with the original meaning of the word *usury*, which, according to all lexicographers, originally meant not, as now, exorbitant interest, but any interest at all, usury being what was paid for *using* money. When the Old Testament forbids *usury*, it is *interest* that is forbidden—taking any pay for the use of money. But this raises a question we shall not here discuss. (For a discussion of the rightfulness or wrongfulness of taking interest and for a history of that question in ethics, see *USURY*.) We here ask simply what part does interest play in modern economic relations; what are the laws which govern it, and how may they be used for the social good?

Here we must, however, sharply notice several important distinctions. The capitalist who invests money to-day usually gets more than mere payment for the use of his money. Why this is so it is easy to see by considering the case first not of a lender of money, but of a corporation or company in business to made money. To do this at the start, it often, perhaps usually, has to borrow money. It does this, hoping out of its business to pay not only for the use of the money borrowed, but also to clear some profits for itself. If it were not for this hope it would not borrow the money or go into business. It can thus be seen that interest or what it pays for the use of borrowed money and profits for itself are two distinct things. Interest may be and often is at 6 per cent when profits are at 12 or more. It is, of course, often true that in a business there may not be for a long time, and possibly may never be, any profits. The business may be run simply paying rent, wages, and interest; but this is only done for a while, because it is hoped that eventually profits will accrue. Thus having

seen the distinction between profits and interest in the case of a business corporation, we can now see that they are still distinct even when paid to the same person. A corporation or individual may have money enough to furnish their own capital without borrowing. They, in this case, may be said to borrow of themselves. They expect, therefore, not only profits, but interest on the money they put in. They expect this because capital, under competition, can always command some interest (whatever the market rate is), and they go into business only because they expect to get something more than the mere rate paid for the use of money; they expect to get some profit out of their especial venture or undertaking. Interest and profits (*q. v.*) are thus distinct.

We must now see another distinction. Some trades are more risky and uncertain and perhaps more dangerous than others. Those who invest money in such pursuits, therefore, demand and can get extra pay for running an unusual risk. They can get this, for otherwise they would prefer to put their money in safer ventures. Hence besides ordinary interest or payment for the use of money, they get extraordinary interest or payment for their risk. Hence such interest is really made up of two elements: (1) payment for the use of money—interest proper; and (2) indemnity for risk. Thus, a corporation or individual has to pay, besides wages, and rent, and interest proper on its capital, an indemnity for its risks and profits or dividends (if it has stockholders) on its business. In economic thought the general word *interest* is generally used to cover the indemnity for extra risks, and the expression *interest proper* is used for interest in its narrower sense of the ordinary payment for the use of money. We shall so use the terms in this article.

We come now to ask what are the laws which govern interest? Interest, under competition, is governed, in the first place, by the law of supply and demand. When there is much loanable capital, interest falls; where there is much demand for capital, interest rises.

Says Professor Marshall ("Economics of Industry"):

Combining the laws of supply and demand we get the law of the normal rate of interest, which is: When the economic conditions of a country have been nearly uniform for a long period of time, the supply of capital is such that the rate of interest which can be obtained for it is that which has been required to cause this supply to be forthcoming; and the rate thus determined is the normal rate. The rate is in equilibrium when it

is just that at which the whole supply of capital can find employment.

From this general statement many minor truths follow. First, interest (including in it payment for risk) varies with the risk of losing the capital invested. Where this risk is at all serious, interest grows very high. Unstable governments like Turkey or Egypt, or "shaky concerns" or doubtful parties pay sometimes enormous rates of interest. The poor always have to pay higher risks than the rich. Four or 5 per cent a month (48 and 60 per cent a year) are not uncommon rates in pawnbrokers' shops. Forty dollars are not infrequently paid by the poor in a few months for a first loan of \$20 or less. Second, interest varies with the length of time for which the capital is borrowed. People want proportionate compensation for the trouble of frequent transference of capital and their risk of being unable to replace at once. Money on short-

time loans will be often three times long-time rates. Here again the poor, who borrow to meet immediate necessities, are often at great disadvantage. Third, interest tends to an equality in different trades.

Says Professor Jevons, in his "Primer of Political Economy":

The most important fact about interest is that it is the same in one business as in another. The rates of profit differ very much, it is true, but this is because the labor of superintendence is different, or because there is greater risk in one trade than in another. But the true interest is the same, because capital, being lent in the form of money, can be lent to one trade just as easily as to another. There is nothing in circulating capital which fits it for one trade more than another; accordingly it will be lent to that trade which offers ever so little more interest than other trades. Thus there is a constant tendency to the equality of interest in all branches of industry.

Fourth, interest tends to obey the so-called law of diminishing returns (*q. v.*). As civilization advances, the price for the use of money falls, for various reasons: (a) Because stability and confidence, as a rule, increase, and less and less of the element of payment for risk enters into the payment for money; (b) because as society grows wealthy the supply of capital increases in proportion to the demand—how this is modified we shall see later; (c) because capital applied to land already well cultivated causes in general a less than proportionate increase in the return, or, as we may say, it will obtain a diminishing return. This last element is called by some economists exclusively the law of diminishing return (*q. v.*). How all these laws are modified by the advance of civilization in opening up new channels for the employment of capital we shall in a moment see. But it is necessary to note this law, for it is made much of by writers like Edward Atkinson, who assert that capital is always getting a less and less portion in distribution, and labor always more and more.

It is true of interest as the price paid for the use of capital; it is only partially true of the whole share of capital. The latter, as we have seen, includes interest proper and profit or dividends. Now, interest proper may decrease and yet dividends increase. A fall in the current rate of interest, says G. Bernard Shaw, indicates rather "a tendency of the real interest or share of capital to increase. Current rates of interest we all know tend to fall with increase of population; yet at the same time the market value of established stock rises with increasing population, rises, therefore, as the current rates fall. The current rate," he says, "must, under present conditions, eventually fall to zero, and even become 'negative.' By that time shares which now bring in a dividend of 100 per cent may very possibly bring in 200 or more."

Capital, by being invested in established stocks, may thus be getting larger dividends, altho the popular rate of interest be falling. Again, tho the *rate* of both dividends and popular interest be falling, the return to the wealth of a few individuals may be steadily gaining, because the amount of the principal on which they draw grows rapidly. Two per cent on \$1,000,000 is better than 10 per cent on \$1,000. While millionaires are, as at present, yearly adding millions to their principal, it is small comfort to the poor to be shown by Mr. Atkinson that the *rate* of interest or even of dividends may be slightly falling.

Coming now to ask what are the present rates of interest, Professor Jevons, writing in 1878, says ("Primer of Political Economy"):

The rates of interest actually paid in business vary very much, from 1 or 2 per cent, up to 50 per cent or more. When the rate is above 5 or 6 per cent, it will be to some extent not true interest, but compensation for the risk of losing the capital altogether. To learn the true average rate of interest, we must inquire what is paid for money lent to those who are sure to pay it back, and who give property in pledge, so that there may be no doubt about the matter. It seems probable that the true average rate of interest in England is at present about 4 per cent, but it varies in different countries, being lower in England and Holland than anywhere else.

Says Professor Marshall more recently ("Economics of Industry"):

The normal rate of interest in England does not seem likely to deviate much from 4 per cent for some time to come; but it may be slowly altered by changes in the field of employment, while the market rate of interest is oscillating rapidly up and down on either side of the normal rate as a center. . . . A rate of 8 per cent on sound investments has spread like a wave steadily over the greater part of the North American continent; and this is being followed by waves of 7 and of 6 and even 5 per cent interest that have already started on their way westward and southward from the Northern Atlantic States."

Concerning the future, he says:

It is difficult to forecast the distant future of the rate of interest. Hitherto the progress of civilization has increased the willingness to save at a low rate. In old countries, in which men are accustomed to work patiently for small gains and to value highly the possession of a secure income, a low rate of interest seems to have little effect in checking the accumulation of capital. In England, for instance, in spite of the low rate of interest, the capital of the country is increasing at the average rate of about £500,000,000 annually; that is, by a little more than a thirtieth of its total amount. If this rate of increase were sustained for 400 years, the capital owned by Englishmen would be multiplied a millionfold, and in 800 years a billionfold. But however high the hopes we may have of the future progress of the arts of production, we cannot suppose that there will ever be a field for the profitable employment of as much capital as this. Sooner or later the rapid growth of capital must increase the competition of capital for the aid of labor, and diminish the competition of labor for the aid of capital.

Professor Marshall therefore concludes that the share that capital may draw from production will probably tend to be less, and so interest falls. He thinks, however, that it will not fall rapidly to a minimum, but fall slowly, and the rate of fall become slower and slower as it approaches the minimum. A recent illustration in the United States of the lowering of interest is the refunding in Feb., 1897, of some forty odd millions of maturing 7 per cent bonds of the Lake Shore Railway in a 3½ per cent 100-year gold issue limited to \$50,000,000.

But it must not be thought that the problem of interest will be removed from the world while wealth goes on amassing, as it has in England and New York City, for example, with the consequent increasing returns to the fortunate few in spite of falling interest.

Indeed, the fall of interest accompanied by the amassing of wealth rather intensifies many of the problems involved in interest, because when the rate of interest is low, it takes a very large capital to produce the income demanded by many modern families. Hence there results an increasing dissatisfaction with small capital and a more feverish and intenser struggle to earn, and perhaps quite as likely to inherit or by fortunate speculation to acquire large fortunes. This very dissatisfaction tends to induce a willingness on the one hand to run large risks and deal in speculative interests, which makes interest a little higher, and also tends to create a demand for socialistic and other reforms, which again tends to raise interest by making investments insecure and profits uncertain. Only very large capitals and strong houses and corporations can stand hard times and low rates of interest. Thus in the

question of the future of interest is involved the whole social movement.

All we can do is to note the laws which at present govern the rate of interest. Besides those above noted, or, rather, as special applications of those laws, we may see that every invention or discovery tends, for a while at least, to raise interest, because it creates a new demand for capital to put the inven-

Other Factors

tion in operation. It may, however, eventually lower interest because it may enable men to produce with much less expensive plant. The general tendency of invention, however, has been to cheapen production by increasing the cost and extent of plant to enable the producer to very much increase the volume of his product, and so make greater profits by selling at lower rates. The invention of steam transportation has cheapened products, but has enormously increased the demand for capital. Density of population, too, tends to increase the opportunity to use capital. So, too, does the raising of the standard of living. Marshall points out that when a community begins to outgrow its primitive cheap buildings and demands expensive buildings, the demand for capital rises, and with it the rate of interest. One other factor and a general conclusion Marshall states in these words:

There is also the demand for the loan of wealth by persons or states who do not intend to use it productively, but who mortgage their future incomes to enable them to increase their expenditure in the present. This part also of the demand for capital will be the greater the lower the rate of interest at which loans can be obtained.

We see then that the demand for capital depends on the numbers of the population, the natural resources of the country, the scope that the arts of production afford for the employment of auxiliary capital, and the needs of unproductive consumers.

PROPOSED REFORMS

Such being the main laws which govern interest, we come now to ask how they may be used for the social good. The advantage of low interest to a community is apparent. It may indeed be abused by persons borrowing when they would do better not to borrow; but this is a matter of education, and is overbalanced by the stimulus which low interest gives to production, the employment of labor, and the development of natural resources, with all the accompanying advantages. Therefore many schemes have been proposed looking to the lowering of interest. The oldest and seemingly the simplest of these is for government to enact laws forbidding interest above a fixed rate. This was in the Middle Ages, and until recent times the universal custom, due in part to the medieval belief that interest was wrong (see *Usury*); and in part to a paternal theory of government, according to which the state should aid the poor. To-day few believe in this method. It is seen that practically its only effect is to raise and not lower the price. We quote on this point a classical passage from J. S. Mill ("Political Economy," Book V., chap. x., § 2):

It is, however, a misapprehension of the causes which influence commercial transactions to suppose that the rate of interest is really made lower by law than it would be made by the spontaneous play of supply and demand. If the competition of borrowers left unrestrained would raise the rate of interest to 6 per cent, this proves that at 5 there would be a greater demand for loans than there is capital in the market to supply. If the law in these circumstances permits no interest beyond 5 per cent, there will be some lenders who, not choosing to disobey the law, and not being in a condition to employ their capital otherwise, will content themselves with the legal rate; but others, finding that in a season of

pressing demand more may be made of their capital by other means than they are permitted to make by lending it, will not lend it at all; and the loanable capital, already too small for the demand, will be still further diminished. Of the disappointed candidates there will be many at such periods who must have their necessities supplied at any price, and these will readily find a third section of lenders who will not be averse to join in a violation of the law, either by circuitous transactions partaking of the nature of fraud, or by relying on the honor of the borrower. The extra expense of the roundabout mode of proceeding, and an equivalent for the risk of non-payment and of legal penalties, must be paid by the borrower, over and above the extra interest which would have been required of him by the general state of the market. The laws which were intended to lower the price paid by him for pecuniary accommodation end thus in greatly increasing it. These laws have also a directly demoralizing tendency.

Such restriction, altho approved by Adam Smith, has been condemned by all enlightened persons since the triumphant onslaught made upon it by Bentham in his "Letters on Usury," which may still be referred to as the best extant writing on the subject.

Another popular method for lowering the rate of interest, agitated in the United States since the war, has been the issue of paper currency by the government or by some means the increasing of the currency of the country, thus aiming to increase the amount of capital to be loaned, and thus to lower interest. But the wisdom or unwisdom of this depends wholly on how it is done, and so we consider it under EXPANSION and CONTRACTION OF CURRENCY. It should be noted here simply that if the rate of interest depend on confidence, as we have stated above, no amount of increase of currency will lower interest, if the currency be depreciated or break public confidence. This is the danger of that plan. If this could be avoided, and it seemed advisable for other reasons, it would doubtless lower interest.

A third popular method for lowering interest, and one recently much agitated, is for the government to make loans to people directly on security of any form of property. It is said that if the government makes loans to the bankers to furnish the banking system of this country, and out of this the bankers make large profit by reloaning the money sometimes at high interest, there is no reason why the government should not do the same by all classes, instead of compelling all others to go to this one favored class of money brokers whenever they need to borrow. There have been various plans proposed for governmental loans, usually at 2 per cent. The agricultural class has been especially active in urging such plans, and especially the so-called sub-treasury plan (*q. v.*), by which government should lend at 2 per cent on agricultural produce brought to appointed government elevators or storehouses. This is by no means a merely popular and unscientific scheme. At the meeting of the American Economic Association, Aug. 23-26, 1892, Professor Commons said ("Report of Proceedings," p. 70):

That seems to me the most scientific plan put forward by any writer or thinker. . . . The sub-treasury will give an elastic currency. I do not want to favor a scheme like this on my own responsibility; but the fact is that this very scheme is in operation, and has been for about six years in Russia. It is not a new thing even in this country. In colonial times Maryland and Virginia had a sub-treasury plan. They had warehouses, where tobacco could be stored, and the farmer was given a certificate, which was legal tender throughout the colonies. It circulated as money, but it did not represent the faith of the government; it represented goods which were stored—just what the farmer wants to-day.

Perhaps the only obstacle to the plan is one of administration, and the question why the same plan should not be applied to all commodities as well as agricultural, and therefore, when it comes

to that, if there cannot be a different scheme of governmental socialism, whereby interest shall not be reduced, but practically abolished.

Fearing that this scheme thus directly leads to socialism, most individualists and all conservatives oppose it, and would trust simply to the competition of capitalists to lower interest, a competition which they say has already lowered interest, so that stable governments can now loan money at 3 per cent, and which they say will gradually still lower all interest, if confidence is not upset by sub-treasury paper money and socialistic schemes.

To this it is answered that competition of capital cannot be trusted, because we are having to-day the combination of capital. Wherefore some Socialists would practically abolish interest by having all capital owned by the nation or community and individual wealth be obtained only by a system of labor checks. (See SOCIALISM.) A large number of Socialists, however, with other social reformers would not favor direct attempts to either reduce or abolish interest, but simply by steadily expanding the sphere of the democratic State in and over industry gradually reduce the sphere of and demand for private capital, and hence steadily reduce interest till it finally fell to nil. The mere nationalization of railroads, it is claimed, would cut off such a large opportunity for the investment of money as to leave no adequate field for the enormous fortunes of to-day, and so compel the rapid decline of interest. Still another class of thinkers (see SINGLE TAXERS) believe that interest may be lowered by freeing land values, and so making the producer less dependent upon the capitalist. (See CAPITAL; USURY, etc.)

INTERNATIONAL, THE: The International was a society attempting to unite the working classes of all nations in one socialistic organization. As early as 1840 endeavors were made in this direction, when some German refugees in London formed a Deutscher Arbeiter-Bildungsverein, later called the Society of the Fraternal Democrats, and aiming to unite all nationalities. The manifesto published by Marx and Engels, 1847-48, aided the movement. The coming of some French workmen to the London Exhibition of 1862 led to further exchange of ideas, and on Sept. 28, 1863, in St. Martin's Hall, London, a meeting was held under the presidency of Professor Beesly (*q. v.*) and the International organized.

Englishmen were chosen as president, secretary, and treasurer of the general council; corresponding secretaries were appointed for the affiliated countries, and Marx naturally received the office for Germany.

Beginnings At first the policy of the International was little defined, and thus, in endeavoring to unite the workers of all countries, it came to stand for various things in the various countries. Even Mazzini for a while joined it, but drew out when it developed the materialistic socialism he opposed. (See MAZZINI.) In England it meant little more than international trade-unionism, and when English workmen found that on the Continent it meant more they virtually left it. In Germany it became socialistic. (See GERMANY.) In France and most Latin countries it developed anarchist-communism. In the United States it had little more than a nominal existence. These divergences naturally proved its

weakness, but for a while it alarmed all European governments. Marx became its real leader. He wrote an address in which he dwelt upon

the want prevailing among the working classes, want which had continued undiminished since 1848, tho the property classes had become more prosperous. He held it to be incontrovertibly proved that the perfection of machinery, the utilization of science in industry and agriculture, the extension of markets, artificial measures like colonization and emigration, as well as free trade, were all unable to relieve the condition of the laboring population. Asking for a remedy, he found it in cooperative labor developed to national dimensions and promoted by State resources. But as the landowning and capitalist classes would be sure to use their political privileges for the defense of their economic monopolies, the working classes must first acquire political power. They possess one element of strength, that of numbers, but numbers without union were of no avail, and thus it was a paramount duty to combine for mutual defense and offense. "Proletariat of all countries, unite!" ended the address.

The European governments began to take alarm. The first congress was to have been held in Brussels, but was not allowed, and another conference was held instead in London. The first real congress was held at Geneva in 1866, sixty delegates being present, and the second at Lausanne, Switzerland, in 1867. The spirit at this congress was more radical, as in the words with which the president closed the congress: "We want no more governments, for governments oppress us by taxes; we want no armies, for armies massacre and murder us; we want no religion, for religion chokes the understanding."

Bakounin, the Russian apostle of nihilism, joined the International and fought with Marx for the leadership. Marx and his friends desired a revolution to be conducted by the orderly political capture of the state and the use of the state to develop communism. Bakounin desired to plant communism on the ruins of the state. For a while his fiery leadership carried the mass of the members with him, particularly in Italy, France, French Switzerland, and Belgium. Germany favored the Marxist policy, and in 1869 the Social Democratic Party was formed on its lines. In 1870 the congress was to have been held in Paris, but this was prevented by the Franco-German War, a war which the International strenuously denounced. The revolutionary spirit gave birth to the uprising of the Paris Commune (*q. v.*), tho the International was not directly connected with it. Marx found that this anarchist element must be suppressed, and the General Council arranged to have the congress of 1872 held at The Hague, where Bakounin could not easily

The End

come, as he was in Switzerland and would have been arrested in passing through either Germany or France. As a result, the Marxist party triumphed at The Hague, and removed the seat of the General Council to New York City to avoid the machinations of Bakounin. The Bakouninists, however, repudiated The Hague congress and held another at Geneva, claiming to represent the true International. The movement thus divided soon came to an end both in Europe and America. For a while the "autonomists," as the Bakounin faction styled themselves, kept up a fiery agitation, created several uprisings in Southern Europe, and in the Latin countries had the majority of the organization with them. But suppressed by the police, and unable to effect solid organization, especially after the death of Bakounin in 1876, the party died as an organization, its members, however, becoming the modern anarchist-communists of Europe. (See ANARCHISM.)

The Marxist movement has passed into the

Social Democratic parties, formed first in Germany and later in even the Latin countries on Marxist lines, the Socialist congresses being the real representatives of the International to-day. (See SOCIALISM.)

In the United States, the International was at first, as in England, considered a mere union of organized labor in all countries, and many American trade-unionists joined it, and delegates were sent to some of its European congresses as in 1867 at Basle. Numerous branches were formed in America, but never took root. After the removal of the General Council to New York in 1872, the struggle between the anarchists and the Socialists reappeared on the new shores. In 1877 the Socialists took the name of the Socialist Labor Party, and left the International practically to the anarchist-communists, the trade-union element having abandoned it long before. The Socialists, however, did not wholly leave it till after the arrival in this country of John Most in 1882 and the final separation in 1885. Among the anarchist-communists two separate societies developed, the I. W. P. A. (International Working People's Association) and the I. W. A. (International Workman's Association), the latter being less violent and emphasizing education. (See ANARCHISM.) Both organizations have disappeared (see ANARCHISM), but their spirit has produced monuments in this country like the so-called anarchist movement in Chicago and the various gatherings and deeds of anarchists.

INTERNATIONAL ARBITRATION: No great movement has more to show in the way of accomplished facts than that for the substitution of arbitration for war in the settlement of international controversies. A hundred years ago almost nothing had been done in the way of the practical application of the principle of arbitration. Theoretically, the subject had been ably treated by the great publicists of the seventeenth and eighteenth centuries—Hugo Grotius, William Penn, the Abbé de St. Pierre, Immanuel Kant, and others—but as between sovereign, independent nations the practise of arbitration was almost unknown.

At the opening of the nineteenth century, however, a new era of arbitration began. The Jay Treaty, negotiated in 1794, provided for the settlement, by mixed commissions, of three disputed questions between the United States and Great Britain. These settlements were the beginning of an interesting series of arbitrations, which have within the last generation increased in number almost in a geometric ratio. Up to 1850 only about thirty international controversies had been adjusted in this way, the U. S. and Great Britain leading in the matter. By the end of the century the number of arbitrations had increased to more than two hundred. Over sixty of these settlements occurred in the decade from 1890 to 1900, an average of more than six a year for the whole ten years. These arbitrations covered disputes of nearly every conceivable kind, from great boundary questions down to mere claims for pecuniary damage. In not one of these cases was the award made by the arbitrators ever rejected. The public faith and honor of the nations was found sufficient always to secure obedi-

ence to the decree of the arbitrator or the temporary tribunal.

During the second half of the century nearly all of the civilized governments went on record, through their parliaments, as favoring the general application of the principle of arbitration to the settlement of international controversies. In a number of cases this approval was by practically unanimous vote.

The setting up of the Permanent International Court of Arbitration by the Hague Conference was not an accident. All of the great peacemakers of the century—Dr. Worcester, Dr. Channing, Charles Sumner, Elihu Burritt, Richard Cobden, John Bright, Henry Richard, Victor Hugo, and others—had pleaded for a court of this character. When the Hague Conference met, in 1899, this plea of the peacemakers, reiterated by the International Peace Congress, the Interparliamentary Union, the Mohonk Conference, and other similar organizations, had become so powerful and the undisputed success of arbitration in practise had become so great that the conference saw that the logical thing to do was to incorporate arbitration into a general system to take the place of the temporary tribunals, which had previously been created for disputes as they arose. The result was the setting up of the Hague Court, to which twenty-six powers are parties. The court is composed of seventy-six judges, each nation being entitled to not more than four representatives in the tribunal.

This international tribunal was successfully inaugurated in 1902 by a reference to it by the governments of the U. S. and of Mexico of the long-standing Pious-Fund controversy. Three other controversies—the Japanese House Tax case, the

History

Venezuela Preferential Payment case, and the difference between Great Britain and France as to the treaty rights in Muscat—have been successfully adjudicated by the court, which is now thoroughly established in the confidence of the nations as the proper medium for the adjustment of any controversy which may hereafter arise among the signatory powers. The court has been further strengthened and its permanency assured by the conclusion of special treaties of obligatory arbitration stipulating reference of disputes to its jurisdiction. The first of these treaties was that concluded between Great Britain and France on Oct. 14, 1903. Since that time thirty-eight similar treaties have been signed between the European nations, two and two, and six between South American countries or South American and European nations. Two of these treaties, those between Denmark and the Netherlands and Denmark and Italy, are without limitations of any kind. One of them, the Danish-Portuguese, is drawn for ten years, but is otherwise unlimited. The Norwegian-Swedish treaty is concluded for a period of ten years, and provides that questions of honor or vital interest, should they arise, shall be submitted to a preliminary investigation by the Hague Court. The rest of them run for five years and stipulate reference to the Hague Court only of questions of a judicial order and disputes arising about the application or interpretation of treaties.

The international arbitration movement has made steady and substantial progress the past year. The various organizations working for the pacific settlement of international disputes and

the ultimate extinction of war—the peace societies, the peace congresses, national and international, the Interparliamentary Union, the International Law Association, the Mohonk Conference, and other kindred bodies—have all enlarged and strengthened their forces.

The National Peace Congress, held in New York in April last and attended by more than a thousand representatives from no less than thirty-eight states, among whom were some of the most eminent men of the nation, was the greatest arbitration and peace demonstration ever held, and revealed in an unexpected measure the extraordinary hold which the ideals of arbitration and peace have taken upon the masses of the people and even upon the national authorities.

The number of treaties of obligatory arbitration concluded by the nations, two and two, has increased to forty-five, the last of these being the Danish-Portuguese Treaty, signed in March, 1907.

Present Status

This treaty, as stated above, is to run for ten years and stipulates the reference to the Hague Court of all disputes between the two governments, whatever may be their nature. But this is the only treaty of its kind negotiated during the past year. The movement which has led to the signing of these forty-five treaties has practically spent itself, most of the important powers having concluded with other countries from ten to twelve conventions of this character. It is not likely that many more if any such treaties will be made, the demand of the civilized peoples now being for something much more general than these limited conventions.

No new cases of controversy have been referred to the Hague Court during 1907. The reason for this has not been, as has been suggested, distrust of the court or decline of interest in the principle of arbitration. The contrary is true; the spirit which has created the practise of arbitration between nations, and given it such remarkable development in the last generation, has grown so strong that the nations are living in a new attitude toward one another, and the result is that either there are no serious controversies, or such as arise are speedily and amicably settled through the ordinary channels of diplomacy. The reaction of the arbitration movement upon diplomacy has, indeed, been very remarkable, and what was once not unjustly considered to be an agency for the fomenting of strife and war has become now one of the most trustworthy and settled agencies for the preservation and promotion of peace. Modern diplomacy has nearly done with war.

International visits, like that of Secretary Root to South America, or of the European heads of government to one another, have now become a part of the fixt international order of the day. Exchange of visits between French and English statesmen and men of affairs, between British and German editors, and between business organizations of different countries, cannot do otherwise than remove prejudices, eradicate causes of misunderstanding, and thus diminish conflicts of a kind which require the services of arbitration courts. Out of this exchange of visits, and to promote further intercourse of the same kind, an Association for International Conciliation has been formed by Baron d'Estournelles de Constant of the French Senate. A branch of this association has been recently created in the U. S., and it is proposed that sim-

ilar branches shall be established as rapidly as possible in all the countries of the world. This conciliation movement goes even deeper than the arbitration movement, and just in proportion as it expands and grows will the arbitration of disputes become less and less frequent, because the growing spirit of conciliation will greatly diminish international controversies.

Outside of the Hague Court there has been little during 1907 in the way of arbitration. A few cases of boundary delimitation and of the adjustment of pecuniary claims, mostly of some years' standing, have been concluded during the year, and a few are still pending. But of serious cases of arbitration there have been none. And it need not surprise us if the Hague Court finds little to do in the near future.

Nothing recently has advanced the cause of international friendship and peace more, probably, than the third International American Conference, which met at Rio Janeiro in July, 1906. The result of this conference has been not simply to reassert and emphasize the conclusions of the second Pan-American Congress in regard to arbitration, but also to create what gives every evidence of being a permanent international union of the American republics. The reorganization of the Bureau of the American Republics and the provision for it of a permanent and worthy home in our national capital has given the twenty-one states of the Western world an organ through which all their common interests and their differences may hereafter be successfully treated and adjusted in the spirit of justice and friendly concert. The result is sure to be a lessening of the causes of contention among these states, and the establishment of peace among them on a much more permanent and immovable foundation. The influence of this Pan-American union in hastening the creation of a similar larger union of the nations of the world is sure to be very powerful. The world can no longer move in halves; and what the Western hemisphere has already done for itself is sure to be realized at no distant date between the two hemispheres.

The great international event of 1907, however, is, of course, the meeting of the second Intergovernmental Conference at The Hague. We have in this, for the first time in human history, an assembly of representatives of all the organized governments of the globe, with the purpose of promoting a larger spirit of friendly cooperation among them all, with a view to their individual and common welfare and the maintenance of general peace among them hereafter. One of the important subjects on the program of the conference which is receiving large and careful attention, is that of the improvement of the convention for the pacific settlement of international disputes, drawn by the first Hague Conference in 1899, and the enlargement of the scope and powers of the permanent International Tribunal of Arbitration. It will be many months, and possibly some years, before the full effects of this second Hague Conference will appear. Whatever may or may not result in regard to the urgent question of limitation of armaments, it is already a foregone conclusion that the system of the pacific settlement of controversies among the nations, and of the avoidance of occasions of controversy, will be enlarged and improved. This will, without

doubt, advance the general cause of the world's peace very greatly, and will entitle the year 1907 to be ranked as one of the great years in the social and political progress of the world.

BENJAMIN F. TRUEBLOOD.

INTERNATIONAL ARBITRATION LEAGUE: *Secretary*, W. R. Cremer, M. P., 11 Lincoln's Inn Fields, London, W. C., England. (See INTERNATIONAL ARBITRATION.)

INTERNATIONAL ARBITRATION AND PEACE ASSOCIATION: *Secretary*, J. F. Green, 41 Outer Temple, London, W. C., England. (See INTERNATIONAL ARBITRATION.)

INTERNATIONAL ASSOCIATION FOR LABOR LEGISLATION: An international association founded at Paris, 1900, to promote progressive industrial legislation in all nations and international knowledge as to labor laws, with a permanent secretaryship and bureau at Basel, Switzerland.

In 1876 Colonel Emil Frey, a president of the Swiss republic, and known in America as a volunteer in the Civil War, and a Swiss minister to the United States, suggested that international conventions establish uniform conditions of labor in all industrial countries; but when, in 1881, the National Council of Switzerland voted to begin negotiations with other countries, the responses were all unfavorable. Of subsequent attempts to secure an international agreement the most memorable is that of the German emperor in 1890. Propositions regarding the regulation of the hours of labor, the work of women and children, etc., were discussed by the delegates without leading to an agreement.

In 1897 the Swiss council again opened negotiations with other governments, but without notable success, and in September of that year the Swiss Workmen's Association took the initiative in calling a conference in Zurich to which it invited economists, government officials, and others. At this conference was developed the project of an international labor bureau of a semiprivate character. At the Paris Exposition of 1900, among the remarkable congresses on social economy was one for the legal protection of working men. At this congress was founded the International Association for Labor Legislation, with a permanent secretaryship and bureau in Switzerland.

While the International Labor Bureau opened in Basel May 1, 1901, is not a full-fledged government bureau like that of the International Postal Union and other international offices in Switzerland, it is already supported in large part by government appropriations, including \$200 yearly from the U. S. Congress, and governmental participation is of increasing importance in its work. The staff of the bureau consists of the director, Prof. Stephen Bauer, a secretary, an assistant, a translator, a librarian, and a clerk. The office aims to be an international bureau of information in respect of labor legislation, and its activity lies chiefly in the collection and publication of such information. Beginning in 1902, it has issued a monthly bulletin averaging fifty pages each and containing four departments: I. Laws, ordinances, and regulations of all countries affecting labor (text in full, abridged or digested according to relative importance). II. Parliamentary proceedings, including bills. III. Resolutions of national and international congresses. IV. Bibliography on labor. Preceding these departments in each issue is an introductory summary and analysis of the contents by Secretary Bauer.

Besides the bulletin on current legislation, the bureau has published the proceedings of the International Association and also several special reports. Meetings are also held of the general committee of the association composed of delegates from each of the national sections and governments. The Swiss Government has also called in-

Hague Conference

The great international event of 1907, however, is, of course, the meeting of the second Intergovernmental Conference at The Hague. We have in this, for the first time in human history, an assembly of representatives of all the organized governments of the globe, with the purpose of promoting a larger spirit of friendly cooperation among them all, with a view to their individual and common welfare and the maintenance of general peace among them hereafter. One of the important subjects on the program of the conference which is receiving large and careful attention, is that of the improvement of the convention for the pacific settlement of international disputes, drawn by the first Hague Conference in 1899, and the enlargement of the scope and powers of the permanent International Tribunal of Arbitration. It will be many months, and possibly some years, before the full effects of this second Hague Conference will appear. Whatever may or may not result in regard to the urgent question of limitation of armaments, it is already a foregone conclusion that the system of the pacific settlement of controversies among the nations, and of the avoidance of occasions of controversy, will be enlarged and improved. This will, without

ternational conferences on industrial subjects at the instigation of the association. Members of the association also were instrumental in procuring a treaty in 1904 between France and Italy, whereby Italy agreed to reduce the hours in manufacturing and to adequately inspect them; while France agreed to treat Italian workmen equally with French in accident insurance, and better to protect Italian children in France. The association hopes for other such treaties. The questions thus far chiefly agitated have been: child labor, the prevention of night-work for women and of the use of yellow phosphorus in the manufacture of matches. Action has been conservative, so that even countries the least industrially progressive can adopt the legislation and thus by raising their standard remove the competition of their low conditions, and therefore free more progressive countries to enact more advanced laws. National sections have been formed in Switzerland, France, Germany, Austria, Italy, Belgium, Netherlands, Hungary, Great Britain (1906), and the U. S. (1907). The Bulletin of the association now appears in French and German and English. See AMERICAN ASSOCIATION FOR LABOR LEGISLATION. Address: International Labor Bureau, Stephen Bauer, secretary, Basel, Switzerland.

INTERNATIONAL BUREAU OF THE AMERICAN REPUBLICS: Established in 1890 by the First International Conference of American Republics, which assembled in Washington, and was presided over by James G. Blaine. It was described as a "Bureau of Information," to bring about a new era in the material relations of the American republics. But when Elihu Root became Secretary of State, he recognized that something should be done on new and broader lines to bring about closer diplomatic, commercial, and social relations between the United States and her sister American republics. It was, therefore, decided by the administration that Mr. Root should make a tour of South America and that at the Third Pan-American Conference, held in Rio de Janeiro in the summer of 1906, steps should be taken to reorganize the International Bureau and enlarge its scope and usefulness. This was done and the main purposes of the bureau are now as follows:

1. To compile and distribute commercial information and prepare commercial reports.
2. To compile and classify information respecting the treaties and conventions between the American republics and between the latter and non-American states.
3. To supply information on educational matters.
4. To prepare reports on questions assigned to it by resolutions of the International American Conferences.
5. To assist in obtaining the ratification of the resolutions and conventions adopted by the conferences.

The following shows something of the work done:

1. During the first five months of 1907 the bureau received nearly 6,000 letters from all parts of the world, asking for specific and important information, and there were sent out nearly 6,000 letters giving careful answers.
2. Aside from these, there were received over 2,000 letters requesting printed matter, and there were distributed over 60,000 bulletins, handbooks, pamphlets, and circulars.
3. Each month the bureau sends out 10,000 bulletins, of not less than 300 pages each, which contain all the latest descriptive and statistical information concerning the commerce and trade and the industrial development of the twenty-one American republics.
4. Handbooks, averaging 200 to 400 pages each, on the principal American countries have already been published or are in process of preparation, which are distributed free or at a charge covering simply the cost of printing and paper.

5. Pamphlets and circulars containing accurate information in relation to mining, immigration, tariff, and land laws, reports of consular officers, articles and addresses by diplomats or specialists about the various countries and their characteristics are published and distributed where they will do the most good.

Address: The Director, Pan-American Bureau, 2 Jackson Place, Washington, D. C.

INTERNATIONAL COOPERATIVE ALLIANCE: Organized in 1894, to further the growth and knowledge of cooperation in all countries. It has held international congresses in London (1895), Paris (1896), Delft (1897), Paris (1900), Manchester (1902), Budapest (1904). It has now 559 affiliated societies in all the main European countries, the English colonies, and the United States. Secretary's address: 6 Bloomsbury Square, London, W. C.

INTERNATIONAL COUNCIL OF WOMEN, THE: A federation of national councils of women, organized in Washington, D. C., 1888. It meets every five years and has held meetings at Chicago 1893, London 1899, Berlin 1904 (this meeting being followed by an International Congress of Women). Its main objects are: (1) to promote unity, mutual understanding, and trust between the women workers of all nations; (2) to provide a medium of communication; (3) to give opportunity for the women workers of all nations to unite on certain general lines of work such as they may decide on from time to time and which they believe will further the application of the Golden Rule to society, custom, and law all the world over. President, the Countess of Aberdeen; secretary, Mrs. Ogilvie Gordon, 1 Rubislaw Terrace, Aberdeen, N. S.

INTERNATIONAL STATISTICAL INSTITUTE: Established in London, 1885. Object: to compare the work and method of statistical inquiry in different States, and to deal with such objects as emigration and immigration, foreign trade, vital statistics, etc. Meetings have been held at Rome, Paris, Vienna, Chicago, Berne, St. Petersburg, Christiania, Budapest, Berlin, and London. It publishes a *Bulletin*, Rome, Italy. The membership is limited to 210. President, Dr. Karl Theodor von Moma-Sternegg; General secretary, Senator Luigi Bodio, Italian Commissioner-General of Emigration at Rome.

INTERPARLIAMENTARY UNION AND PARLIAMENT, THE: An international organization composed of the members of any national legislature. It holds annual conferences to consider questions of world-wide or international importance.

Mr. Cremer, an English trade-union leader, elected to Parliament in 1885, drafted in 1887 a petition addressed to the president and Congress of the United States, and signed by 234 members of Parliament, urging the U. S. to take steps toward an arbitration treaty with Great Britain. With this he came to the U. S. and received a favorable hearing, the immediate action was impossible, and then went to France to urge a similar treaty between France, Great Britain, and the U. S. At a meeting held to consider this, of twenty-five members of the French National Legislature and nine members of Parliament, it was voted to hold a conference during the World's Fair in Paris in 1889, to which the members of

other parliaments should be invited. On June 29, 1889, that conference was held, and 100 members were present, members of the national legislatures of France, England, Belgium, Hungary, Italy, Norway, and the U. S. On the next day, Mr. Justin R. Whiting, of St. Clair, Mich., the sole representative from the U. S. Congress, presiding, the following resolution was unanimously adopted, on motion of Marquis Pandolfi, of Italy:

"Further interparliamentary reunions shall take place each year in one of the cities of the various countries represented at the conference. The next meeting shall be at London."

Among the members were: Mr. Stanhope, Mr. Cremer, Mr. Burt, in Parliament; Jules Simon, who concluded peace between France and Germany; M. Frederic Passy and M. Bourgeois, minister for foreign affairs at Paris.

The resolution to hold periodical conferences was the vital act of that assembly. It gave birth to the Interparliamentary Union; that union has begotten the Hague Court as its first-born, and an international congress as its second child.

The union has held fourteen sessions at the principal capitals of Europe: Paris, London, Berlin, Rome, Budapest, Vienna, Brussels, The Hague, Christiania, Berne, and in 1904 at St. Louis, Mo. It has now over 2,000 members from twenty-three countries, and is becoming a world power.

It was the St. Louis conference of this union which led to the Second Hague Conference (see INTERNATIONAL ARBITRATION), and at the Brussels conference of 1905, Mr. Richard Bartholdt, of St. Louis, as president of the American delegation, on Aug. 29, 1905, proposed the formation of a permanent international parliament. This was favorably received. Count Apponyi and Marquis Pandolfi advanced the idea of transforming the Interparliamentary Union into an official instead of an unofficial international house of representatives.

In Europe parliaments have had little power over international relations, and this step will give them more power. That such an international parliament will be formed is considered certain, the only question being as to its form and powers.

At a special session of the union held in London in 1906, a commission reported in favor of converting the Second Hague Conference into a permanent body to convene periodically and upon its own motion; second, in favor of the codification of the law of nations; and third, for the granting of jurisdiction to international courts of arbitration, for such classes of controversies as are included in treaties of arbitration. Mr. Bartholdt made a motion in favor of national appropriations in aid of international arbitration which met with some opposition in the executive council, but was passed enthusiastically by the conference. A motion by Congressman John S. Williams in favor of the payment of fixed salaries to the members of the Hague Court could not be acted upon, but was well received. Mr. William J. Bryan crystallized the thought of the conference in favor of a treaty of arbitration including in its field pecuniary claims. The commission had thought best to leave this out. But when Mr. Bryan had finished the conference was a unit on this point, on the question of converting the Second Hague Conference into a permanent body, and in favor of a treaty of arbitration granting the Hague

Court the right to try and finally to determine all such questions as are specified in the treaty of arbitration, and the right to try in the first instance all questions of fact, the parties being at liberty to appeal from the decision of the court in the questions not specified as arbitrable.

Baron d'Estournelles introduced the following resolution, which was adopted:

The Interparliamentary Conference believes that the increase of naval and military expenses which already weighs heavily upon the world is universally recognized as intolerable, and therefore expresses the wish that the question of limitation of armaments be placed on the program of the forthcoming conference at The Hague.

IRELAND: Claimed as a portion of the United Kingdom since its conquest by the English in the twelfth century, but with its own Parliament until 1801.

I. Statistics

The area of Ireland is 32,360 sq. m., with a population (1905) of 4,391,543, a decrease since 1901 of 67,232. The number of emigrants from Ireland in 1903 was 40,659. From 1851 to 1903 the emigrants were 2,058,907 males and 1,902,104 females.

The number of inhabited houses was 858,158 in 1901, a decrease of 12,420, or 1.4 per cent. The country is divided into four provinces. The chief cities are: Dublin, pop. 290,638; Belfast, 349,180; Cork, 76,122; Limerick, 38,151; Londonderry, 39,892.

Of the population 3,308,661, or 74.2 per cent, are Roman Catholics (a decrease of 6.7 per cent since 1891); 13.03 per cent are Episcopalians, and 10 per cent are Presbyterians and Methodists.

According to "The Banking and Railway Statistics, Ireland, for 1905," deposits and cash balances in joint stock banks steadily increased from £29,370,000 on Dec. 31, 1885, to £45,432,000, 1905, tho £683,000 less than that for Dec. 31, 1904. Estimated balances in post-office savings-banks increased from £2,438,000 on Dec. 31, 1885, to £10,230,000 on Dec. 31, 1905. Deposits in trustee savings-banks increased from £1,081,000 in 1885 to £2,462,000 in 1905. There are 2,734 miles of railway.

According to the report of the Irish Land Commissioners (1906), from Aug. 1, 1881, to March 31, 1906, there had been 360,135 judicial rents fixt for a first statutory term, with an average reduction of 20.7 per cent.; 70,803 cases had been dismissed; 120,215 cases had been fixt for a second statutory term, with an average reduction of 19.9 per cent on first-term rents, and 17,737 cases had been dismissed.

Under the Land Purchase Act of 1881 there had been 731 advances to tenants amounting to £240,801; under the acts of 1885-88, 25,367 advances amounting to £9,992,536; under the acts 1891-96, 46,398 advances amounting to £13,096,386. Under the 1903 Land Act there had been 5,300 applications, representing £991,553, of which 4,468 were provisionally sanctioned to the amount of £826,220, and 45 applications had been dismissed. The Estates Commissioners reported that from Nov. 1, 1903, to March 31, 1905, the applications for advances had been received from 3,596 estates.

II. Government

The chief executive in Ireland is the Viceroy or Lord Lieutenant (the Earl of Aberdeen), assisted by a Chief Secretary, the Lord Chancellor of

Ireland, the Attorney-General, and a Privy Council. The Lord Lieutenant has charge of the Irish Constabulary and is responsible for the peace. The Chief Secretary is Chief Secretary to the Lord Lieutenant, but also as Chief Secretary for Ireland is directly responsible to the House of Commons for the acts of the Irish Administration. There is also a separate Local Government Board, a Board of Public Works (the main financial agent of the government), a Board of Trade, a Board of National Education, and a Department of Agriculture and other industries and technical instruction, created in 1899. (Vice-President of this board, the Rt. Hon. Horace Plunkett.)

For the policy of the Department of Agriculture, see special article, **IRISH AGRICULTURAL DEVELOPMENT**.

Ireland is represented in the Parliament of the United Kingdom by 28 representative peers and 103 members elected by 691,423 electors. The present Irish members of Parliament (1907) are, 82 Nationalists, 15 Conservatives, 3 Liberals, and 3 Liberal Unionists.

County Councils are established for every administrative district, the members being elected by popular suffrage. Municipal Corporations and Rural District Councils complete the local administrative powers.

III. Social Reform

Social reform in Ireland is inextricably bound up with the past. Divided from early times between warring kings and numerous clans, Ireland was easily conquered by the English under Henry II. in the twelfth century, altho the subjection was long only nominal. When Henry VIII. attempted to introduce Protestantism into the island there were repeated revolts, ending in suppression and the bestowal of the lands of the rebellious chiefs among Scotch and English Protestants. In 1641 the Irish rose in revolt and massacred the Protestants, but were severely punished by Cromwell in 1649, and Protestants were established in the confiscated lands of Ulster. At the Revolution, the Irish Catholics siding with James II., and the Protestants with William and Mary, the struggle ended in 1692, when the triumph of the Orange Party again was accompanied by excessive punishment. Secret revolutionary societies existed still, and a serious revolt occurred in 1798. In 1801, however, the Irish Parliament voted the final union with Great Britain, and Ireland's Parliament ceased to sit. Emmet's insurrection was easily suppress in 1803, but the emancipation of the Roman Catholic Church had to be granted in 1829, and the "tithe war" compromised in 1838. O'Connell's agitation for repeal collapsed in 1843, and the revolution of 1848 was put down. But the Fenian Brotherhood arose in 1858, with, it was claimed, 80,000 adherents in the United States. Riots could be suppress, but agitation went on. In 1869 the Irish (Anglican) Church was disestablished. In 1870 the land question developed. In 1873 the Home Rule Party was developed. For this, see special article, **IRISH HOME RULE**.

History

Until recently this movement has left little opportunity for the development of social reform on other lines. Michael Davitt (*q. v.*) alone of the prominent Irish leaders was an out-and-

out land nationalizer. Trade-unionism began early in Ireland, but died out in the famine years. In 1894 an Irish Trade-Union Congress was held and twelve congresses have followed, attended (1906) by some 100 delegates, representing 80,000.

The creation of the Agricultural and Technical Instruction Department has secured the appointment of women factory inspectors, and induced every important public body in Ireland to adopt the Fair Wages Clause. Now it is agitating works committees in place of contractors.

There are Labor groups on the Dublin Corporation and in most other towns. At the first council elections, in 1899, Cork returned no fewer than twelve Labor men, several of them defeating official Nationalist League candidates.

Cooperation has had some little development. (See **COOPERATION**; on other points, see **TEMPERANCE**; **MODEL VILLAGES**, etc.)

A new Nationalist movement has now arisen in connection with the revival of the Gaelic language and literature. A Gaelic Union was formed in the eighties and in 1893 the Gaelic League. Today it has 300 branches in Ireland and several in England, including one with 3,000 members in London. Its *Simple Lessons* are subscribed for by 150,000 people.

The Irish Industries movement is practically a branch of the League work. It aims at both securing preference for the use of "home-made" manufactures and the improvement of their quality. Its annual exhibition of Irish-made goods in London, starting a few years ago in a very small way, has grown to the great "Aonac," or fair, held Nov. 1st to 3d at the Westminster Horticultural Hall. A permanent London center for the sale of Irish goods and literature had just previously been opened at 26 Ludgate Hill. The League has several organs, notably *Sinn Féin* (We Ourselves); *The Leader* (Dublin), a weekly review of literature, art, and industries, which has ably engineered the industrial revival; and the *Irish Peasant*.

The most significant features of the movement are that it tends to unite north and south, and that it bases its nationalism on an enthusiasm for self-development, rather than mere political antagonisms, altho it is not less, but indeed more nationalist than the Parliamentary Party.

IRISH AGRICULTURAL DEVELOPMENT:

When a new government, with new ideas upon the Irish problem, is on the eve of what is apparently destined to be a long spell of power, the time is apt for a sort of national stock-taking, so that we can fix a point from which to measure the ground gained or lost during the next few years. Such a stock-taking cannot, of course, be attempted here, but a few of the salient facts—facts of the kind that count in summing up a nation's progress or decline—may be mentioned; and those who keep their eye on the aspect of Ireland represented by these facts will, in my judgment, get an adequate notion of the real position of the country.

Regarding, as I do, the willingness of Irishmen to take their own tasks upon their own shoulders as the only true criterion of their true progress, I turn first to the cooperative movement, inaugurated fourteen years ago. By this movement Irish farmers were awakened to the fact that the

agricultural wealth of the country was being exploited by outsiders, and that the Irish producer was being reduced to the position of the man who did the hardest work and who got the smallest reward. They were bidden to organize themselves for distributive as well as for productive purposes, and, as time went on, for some purposes not directly agricultural at all but auxiliary to a well-balanced rural economy. The task of getting a hearing for these doctrines—a task of which I have given some account in my "Ireland in the New Century," was no easy one; but the fact that we are able, after fourteen years of work, to point to a body of 862 cooperative societies, scattered thickly over the whole map of Ireland, and comprising a membership of over 90,000, is sufficient evidence that the seeds of cooperative enterprise fell on good soil.

Most of the societies are for dairy work, others are agricultural; rural banks of the Raiffeisen system have had a most gratifying and valuable

Agriculture

success, and now number 236; and societies for dealing in poultry and eggs, in honey, and, more lately, in products of cottage industry, such as the artistic handicrafts, are showing themselves vigorous branches from the main stem. The influence of all these societies in the training of mind and character is probably their most important function, from the point of view of the founders of industrial cooperation. New interests, new ambitions, are necessarily awakened by the sight of the new horizons which are at once opened out when the man who often was practically a mere field laborer (whether he owned his fields or not) became a member of a business organization, dealing both in the fruits of his labor and in the materials for their production, and helping him to dispose of the first and to acquire the second on terms he had never dreamt of before.

In this way it is clear that the work done in extending the cooperative movement over rural Ireland formed an admirable preparation for the introduction of the technical instruction in agriculture and the allied industries, facilities for which were almost wholly lacking in Ireland until the foundation, in 1899, of the Department of Agriculture and Technical Instruction. This department, it may be observed, is not a bureaucratic institution, working independently of the cooperation of the people for whose sake it exists. It has to submit its plans to councils so constituted that members elected by the local government bodies are in a considerable majority; and the cooperation of the local government bodies themselves (county and urban councils) is essential to the working of the various schemes. The results of about six years of work in the direction of establishing schemes of technical instruction (agricultural and industrial) may be judged from the following details:

In 1900-1, out of 33 counties in Ireland, there were 3 employing trained instructors in agriculture; now (1905-6) there are 22. There were 3 employing instructors in poultry-keeping; there are now 30, and we have 566 stations for distributing settings of eggs of pure breeds. One county employed itinerant instructors in butter-making; 24 do so at present. In horticulture, none were taking part, and now we have 21. Experimental and demonstration plots for showing the results of various methods of manuring, tillage, etc., have risen from nil to 2,475.

In fifty-three of the urban centers in Ireland,

technical schools have been established by the department where none existed before, and over 8,000 pupils are receiving instruction in them. In addition, a large number of day secondary schools have added technical instruction to their curriculum and have been aided to equip laboratories for this purpose. The total number of pupils attending technical schools and classes of all kinds in urban centers in 1905-6 was over 20,000. In 1901-2 there were about 1,300.

These results are satisfactory. They testify amply to the willingness of the Irish people to adapt themselves and their industries to modern conditions. They would be much more striking were it not for two deficiencies, both of which I hope we are to see gradually remedied—lack of trained teachers and lack of funds.

I have elsewhere defined it as the purpose of the department "to assist in developing our agricultural and industrial life by providing practical education for the rising generation, and by assisting our workers by means of useful information and technical advice, illustrated and enforced, wherever necessary, by practical demonstration."

It is not a showy program, but it is, I believe, sound foundation work for the future. It does not aim at doing things for Ireland so much as at putting Ireland in the way of doing them for herself. The key-stone of our system is the preservation of self-respect and the sense of personal responsibility among the people. If we can win on these lines it will be a victory indeed. If not, I fear that no other program of work could afford anything better than some temporary disguise of Ireland's failure to hold her own under the conditions of modern life and work.

HORACE PLUNKETT,

Vice-President of Department of Agriculture and Technical Instruction, Dublin.

IRISH HOME RULE: An effort begun in 1870 to secure for Ireland the right of legislation for herself in a parliament of her own. It is averred that in 1155 Pope Hadrian handed Ireland over to Henry II. as an English dependency, in consideration that some of the revenue should go to the Holy See. From that time to the Act of Union (1800) England asserted through Irish wars and in continual claims, a right to govern Ireland. For many years, however, Ireland had her own parliament, till in 1800 it was cajoled or bribed into its own destruction, and the Act of Union made no recognition of the Irish nationality. In 1834 O'Connell (*q. v.*) commenced his agitation to have the Act of Union repealed, but this movement failed in 1848.

After years of desultory agitation and Fenian conspiracies, Gladstone in 1869 carried through Parliament a bill for Church disestablishment in Ireland and gave hope of land reforms.

In 1870 a "Home Government Association of Ireland" was formed in Dublin by Irishmen of various religious and political beliefs. Its object was declared to be "the obtaining of a distinct parliament for Ireland to regulate her internal affairs, while leaving to the Imperial Parliament all questions affecting the colonies, foreign relations, and the stability of the empire."

Constitutional agitation began, and in the bye elections several Home Rulers were elected to Parliament, including the main leader of the

movement, Isaac Butt. In 1873 the organization became the Irish Home Rule League, and in 1874 sixty Home Rulers were elected to Parliament, who on Irish questions acted as an independent party. In 1875 Parnell was elected to the House of Commons, and by his policy of obstruction occasioned widespread discussion of Irish questions. In 1879 Butt died, and Parnell became president of the Irish Land League, and the land question was made the main issue. In 1880 there were 68 Home Rulers elected, but in 1881 Parnell's radicalism caused William Shaw, who had succeeded Butt, to withdraw from the Home Rule Party. The Irish National League was formed in 1881, under Parnell's lead, combining the aims of the Home Rulers and of the Land League. In 1885 the "Nationalists" returned 85 out of 103 Irish representatives to Parliament, and held the balance of power.

Government without the Nationalists seemed impossible. In 1886 Gladstone brought in his famous Home Rule Bill. Parnell accepted the bill, but many Liberals refused to follow. They took the name of Liberal Unionists and, allied with the Conservatives, defeated the bill, 343 to 313 (93 Liberals voting against it). In this election the Conservatives and Unionists gained a majority of 113, tho the Home Rulers elected 84 members out of 103. Home rule became a burning question. In 1890-91 Parnell was named as corespondent in a divorce case. Gladstone requested Parnell to withdraw from the leadership of his party, and on his declining, a large number of his followers were alienated. Parnell died in 1891, and Justin McCarthy was chosen leader, but dissension was continued. In 1892 the Liberals gained a majority of 40, and in 1893 Gladstone introduced another home rule bill. It was carried, 301 to 267, but was thrown out by the House of Lords. Gladstone resigned and Lord Rosebery formed a ministry, nominally but not actively in favor of home rule. It lasted till 1895 when the Conservatives came into power.

The Home Rulers being divided and the Liberals doubtful, the government tried to meet the question by a land purchase act, and, in 1894, by a local government bill. (See IRELAND.)

The Boer War seemed to revive the Irish National cause, and in 1900 the warring factions united, elected John E. Redmond as their leader and elected 81 Nationalists to Parliament, with a program of blocking legislation till their claims were heard.

In 1905 the Nationalist Congress at Dublin was attended by 2,500 delegates.

The proceedings at the Nationalist Convention held in Dublin, Dec. 6, 1905, were attended by about 2,500 delegates from branches of the United Irish League, and were made specially interesting by the political situation in England. The following resolution was carried unanimously: "That this convention adopts and reaffirms the motion moved by Mr. J. Redmond in the House of Commons on Feb. 20, 1905, namely, 'That the present system of government in Ireland is in opposition to the will of the Irish people and gives them no voice in the management of their own affairs; that the system is consequently ineffective and extravagantly costly, does not enjoy the confidence of any section of the population, is productive of universal discontent and unrest, and has proved to be incapable of satisfactorily promoting the material and intellectual progress of the people'; that the whole Liberal Party, by voting for that resolution, pledged themselves as a party in the most solemn way to undertake at the earliest practicable moment the removal of the monstrous system so condemned, and the substitution in its place of a system of government giving to the Irish people power to manage the affairs of Ireland; and we hereby solemnly assert that no new system of government for Ireland will be accepted as satisfactory or will prove effective except a legislative assembly, freely elected and representative of the people,

with power to make laws for Ireland, and an executive government responsible to that assembly; and this convention declares that the Irish National Party cannot enter into alliance with or give permanent support to any English party or government which does not make the question of granting such an assembly and executive to Ireland a cardinal point in its program.

In the general election in Dec., 1906, there were elected 83 Nationalists. An overwhelming majority of the House of Commons is pledged to some form of home rule. A small but influential section of the Unionist Party seems inclined to accept the situation frankly. Even Ulster sends a minority of Unionists to Parliament.

Many believe that the day of Irish home rule is at hand.

IRON AND STEEL INDUSTRY: This industry, owing to its importance in itself, in the number of men employed, capital invested, and value of product, and also owing to the relation of its product to very many other industries, occupies a foremost place in economic importance. We have been said to be living in an age of steel. In its large relations it is, however, a modern industry, tho iron was known and manufactured in rude ways in ancient times. But the process of puddling and rolling, invented by Henry Colt in 1784, the employment of the hot blast by Neilson, of Glasgow, in 1830, and, above all, the introduction of the Bessemer process of making steel (patented in 1856) have revolutionized the iron industry.

In the United States a foundry blast-furnace was established at Lynn, Mass., in 1643. Iron had been manufactured in Virginia before this. Connecticut made steel in 1656. By 1750, however, Pennsylvania led, exporting 2,358 tons of iron in 1772. The first iron foundry at Pittsburgh was established in 1803. In 1840 the introduction of bituminous and anthracite coal in the blast-furnace wholly changed the industry. The manufacture of charcoal iron has since declined in Pennsylvania. In 1860 there were 652 establishments engaged in this industry. Bessemer steel was first manufactured in any quantity in the U. S. in 1867. The Siemens-Martin or open-hearth process appeared in 1869.

GROWTH OF IRON AND STEEL INDUSTRY IN THE U. S.

| | No. of establishments | Value of product | Exports | Imports |

| 1906..... | | | 160,984,985 | 29,053,987 |

The growth of the industry in the U. S. seems almost without limit.

The U. S. has for some years produced more pig iron than any other country in the world. In 1870 its production was only 1,833,000 tons, but by 1890 it had an annual output of 8,845,000 tons and had wrested first place from Great Brit-

TOWNAPE PRODUCTION IN THE U. S.

ain, and in 1905 it produced 22,992,380 tons, against Great Britain's 9,593,000 tons and Germany's 10,700,000. But in the production of steel there has been still greater growth relative to other countries. The U. S. produced in 1870 only 68,750 tons of crude steel; in 1880, 1,247,335; in 1900, 10,188,329; and in 1905, 20,023,947, surpassing the combined product of Great Britain, Germany, France, and Belgium. The U. S. Steel Corporation, organized with a capitalization of \$1,000,000,000, shows the importance of this industry. It had (1904) 149 steel works, with an annual capacity of 9,000,000 tons of finished work; 78 blast-furnaces, with a capacity of 6,500,000 tons of pig iron; 18,000 coke-furnaces, 71,000 acres of coal lands, 30,000 acres in the coke region, 70 per cent of the ore-mines of Lake Superior, 125 large vessels on the lakes; its employees number over 100,000.

United States One of its most recent extensions is Gary, the "model town" of the Indiana Steel Company, an auxiliary of the U. S. Steel Trust. Of 6,000 acres on the southern shores of Lake Michigan, 1,300 acres will be occupied by the works, the remainder by the work-people; 15,000 men and boys will be ultimately employed. The plant will be capable of handling 5,000,000 tons of ore per annum, with its equivalent of 2,500,000 tons of steel, an amount approximately equal to the entire output of France or Russia. It will include everything required for dealing with ore to finished products, including 16 blast-furnaces, 84 open-hearth steel-furnaces of 60 tons capacity, and the usual mills for slabbing and blooming; billet, rail, and plate mills, rolled sections, and merchant mills. In 1905 the trust produced 44.2 per cent of the U. S. product of pig iron and 60.2 of steel ingots.

¹ Including Luxembourg.² Excluding Finland.

One of the characteristics of the iron and steel industry is the economy of large production, and therefore its consolidation in large plants. The foregoing table shows a lessening number of establishments in the U. S. In 1900, of the 10,685,000 tons of steel manufactured in the U. S., 6,431,000 came from Pennsylvania, 1,813,000 from Ohio, and 1,961,000 from Illinois. In the U. S. in 1905 10,941,375 tons of steel were manufactured by the Bessemer process and 8,971,376 by the open-hearth. In Germany about two thirds of the product is Bessemer; in Great Britain two thirds of the product was by the open-hearth.

The iron industry has seen many contests between employers and employees. (See STRIKES; HOMESTEAD STRIKE.) Labor organization in this industry in the U. S. commenced with the Sons of Vulcan, organized in 1858; but the great organization has been the Amalgamated Association of Iron and Steel Workers (q. v.), dating from 1874.

In England the Friendly Society of Iron Founders (Molders) is the oldest large trade-union in England still existent, having been organized in 1809. It had, in 1904, 18,248

Trade-Unions members, and is a leading union of the older friendly society type. The

Associated Society of Iron and Steel Workers, established in 1862, had, in 1904, 11,031 members, and is best known for its steady advocacy of the sliding scale (q. v.). The more progressive British Steel Smelters' Association, established in 1886, originally a Scotch union, is extending all over the kingdom. The Associated Iron Molders of Scotland, established in 1831, had, in 1904, 7,536 members. The United Society of Boiler Makers and Iron Shipbuilders, established the next year, had, in 1890, 32,926 members.

In Germany in 1904 the unions in the metal and engineering trades had 47,307 members—more than those in any other branch of industry.

IRONS, MARTIN: Knight of Labor; born Dundee, Scotland, 1832. Came to the United States in 1846 friendless and penniless, and be-

came apprentice in a machine-shop. Gradually accumulating his earnings he opened a grocery store in New Orleans, but failing, returned to his trade in Lexington, Ky. In 1885 he joined the Knights of Labor. As chairman of the Executive Board of D. A. No. 101, K. of L., he ordered and led the great railroad strike of 1886 on the Gould system (see STRIKES). The strike failed, and after various struggles Irons died in want and suffering near Waco, Texas, 1901.

IRRIGATION: American irrigation is so old that its history fades away in dim tradition. Centuries before the Norsemen landed upon the shores of New England a dense population dwelt in the hot valleys of the far Southwest. From the solid rock, with primitive tools, they cut canals along the mountain sides, and hewed blocks for many-chambered palaces which they erected in the desert or on the ledges of deep river cañons. In the voiceless ruins of these buildings and in their many miles of canals and ditches may almost be read the story of another Egypt—a people toiling in the burning sun of the semitropical desert, laboriously executing the commands of an American Pharaoh.

Even in less remote periods, when the Spanish explorer Coronado swept up the Colorado River, venturing as far as Kansas, he found in New Mexico a gentle race of Indians, dwelling in pueblos and irrigating their little fields and orchards as their forefathers had done, perhaps, since the days of Abraham. In the early settlement of California by the Spaniards, the good padres introduced irrigation, utilizing the mountain streams to make fertile the desert patches. Pushing on rapidly we find twenty-five or thirty years ago a network of irrigation canals and ditches with thriving communities of Anglo-Saxons producing abundant crops from the parched soil. This development was almost coincident with the invasion of Utah by the Mormons, who practised irrigation with great success.

But the question of water-rights soon became a vexed one. Men who had, for years, utilized the waters of a stream suddenly found its flow diminishing owing to the settlement of other irrigators at its head waters. **History** Thus began an agitation for national irrigation and the building of great canals and storage dams which would supply water enough for all.

The eastern part of the United States knew but little of the subject. That the general government should enter into irrigation construction for the benefit of private parties, even new settlers, was looked upon by many as an entirely too paternalistic scheme. All attempts to secure government appropriations for irrigation met with stubborn opposition and defeat. In 1898 the National Irrigation Association was formed. An aggressive campaign was begun at once to educate the people of the country to the great national benefits which the country as a whole would derive from government assistance to irrigation. Irrigation conventions were held, an extensive newspaper campaign of education was carried on, business men were organized—they were quick to see the trade advantages of creating a multitude of new homes on the land—and finally such a favorable sentiment was created that a few congressmen undertook to secure the passage of an irrigation law. Senator Newlands of Nevada (then a representative) worked out a plan which from

a constitutional standpoint met the opposition of the strict constructionists, President Roosevelt contributed his hearty support and powerful influence, and after a hard fight a law was passed June 17, 1902.

The principal features of this law are briefly:

First. A reclamation fund in the treasury, consisting of the proceeds from the sales of public lands in the sixteen arid and semiarid states and territories.

Second. A reclamation service to investigate and report on the irrigation projects for the approval of the Secretary of the Interior, who may authorize construction and let contracts, providing the money is available in the fund.

Third. The return to the fund of the actual cost of each project by the sale of water-rights, payments to be made in a series of instalments running over a period of ten years.

Fourth. The holding of public lands for actual settlers under the Homestead Act, in small farm units sufficient to support a family; no commutation to be permitted.

Fifth. The sale of water-rights to private landowners, but not for more than 160 acres, making land monopoly impossible and forcing the division of large estates.

Sixth. The ultimate turning over to the people of the irrigation works, except the reservoirs, to be operated and managed by them under a system of home rule. The actual users of the water in ten years after the completion of the works will have repaid to the government the amount of its loan without interest. The money so returned may again and again be expended on other works.

The reclamation fund has at its disposal now about \$40,000,000. It has made exhaustive surveys of about forty great irrigation projects, distributed throughout the arid region, which comprises over one third of the area of the U. S. and it has made preliminary surveys and reconnaissances of many more. Several projects have been already in part completed, and the rush of settlers to acquire the land for homes has indicated the remarkable success of this government venture. Cautious statesmen feared that when the government works were completed there would be difficulty in getting settlers to take the land and pay back the cost of the construction to the government. Enough work has already been done to amply disprove this theory. It is the opinion of experts that with \$400,000,000 instead of \$40,000,000 in the reclamation fund, there would be a steady and overwhelming demand for government irrigated lands, as fast as it could be made available.

Briefly the work of the reclamation service to 1907 may be summarized as follows:

The government has dug 1,267 miles of canals, or nearly the distance from Washington to Omaha. Some of these canals carry whole rivers, like the Truckee River in Nevada and the North Platte in Wyoming. The tunnels excavated are 47 in number, and have an aggregate length of 93 miles. The service has erected 94 large structures, including the great dams in Nevada and the Minidoka dam in Idaho, 80 feet high and 650 feet long. It has completed 670 head works, flumes, etc. It has built 376 miles of wagon road in mountainous country and into heretofore inaccessible regions. It has erected mill in operation 787 miles of telephones. Its own cement mill has manufactured 70,000 barrels of cement, and the purchased amount is 312,000 barrels. Its own saw-mills have cut 3,036,000 feet board-measure of lumber, and 6,540,000 feet have been purchased. The surveying parties of the service have completed topographic surveys covering 10,970 sq. m., an area greater than the combined areas of Massachusetts and Rhode Island. The transit lines had a length of 18,000 linear miles, while the level lines run amount to 24,218 miles, or nearly sufficient to go around the earth.

The diamond drillings for dam sites and canals amount to 47,515 feet, or more than 9 miles. To-day the service owns and has at work 1,155 horses and mules. It operates 9 locomotives, 223 cars and 23 miles of railroad, 39 stationary engines and 37 steam-engines. It has constructed and is operating 5 electric-light plants. This work has been carried on with the following force: Classified service, 380, including Washington office; laborers employed directly by the government, 3,500; laborers employed by contractors, 6,100, or a total of all forces of 10,000. The expenditures now total nearly \$1,000,000 per month. As a result of the operations of the reclamation service eight new towns have been es-

established, 100 miles of branch railroads have been constructed, and 10,000 people have taken up their residence in the desert.

And all this is but a very moderate start. The waters of Western rivers which now run to waste would reclaim, if stored and utilized, in the neighborhood of 75,000,000 acres, according to government engineering estimates. To eventually reclaim such a vast empire will cost probably, on an average, from \$30 to \$50 per acre. The greatness of this entire undertaking, therefore, is far beyond anything which has ever been accomplished or even projected by any government.

Results The unique feature of such a development is that the actual cost to the government is really nothing, as the money expended all comes back into the reclamation fund, and when the last acre is reclaimed will be covered back into the federal treasury. The reclamation fund amounts to a loan by the government without interest.

The rapidity with which the government has carried on its irrigation work is regarded as phenomenal. British engineers from India, where England has spent some \$200,000,000 in building irrigation works, have expressed the utmost astonishment and surprise at the rapid progress which our engineers have made.

The future possibilities of American irrigation are almost beyond intelligent comprehension and they bid fair to constitute an important factor in maintaining our agricultural equilibrium. While the Eastern farm unit is comparatively large, under irrigation and intensive cultivation, a very small tract of land will support a family in comfort. Many of the irrigated farms of the West are twenty, ten, five acres, and even less, and those best calculated to judge accurately, state that the western half of the U. S., which now has a population of less than 10,000,000, is capable of supporting, in comfort, an additional population of at least 50,000,000 people. All in all, American irrigation looms up as one of the very greatest influences for civilization and internal development of the present century.

For more complete history of irrigation in the U. S., see "Irrigation," by F. H. Newell, and "The Conquest of Arid America," by Wm. E. Smythe.

GUY ELLIOTT MITCHELL.

ITALY: A kingdom since 1861, when the first Italian Parliament elected Victor Emanuel II., of Sardinia, King of Italy, tho the province of Rome was not annexed till 1870.

I. Statistics

Area 110,550 sq. m.; population (1904) 33,346,514. The population of Italy is very homogeneous. Exceptions are 80,200 of French origin; 11,400 Teutonic; 90,000 Albanian; 31,200 Greek; 9,800 Spanish; and 30,000 Slav.

In 1901 the population over fifteen years was 21,318,495—7,534,346 single; 11,686,715 married; 2,097,434 widowed. Of the whole population 57.6 per cent were single; 36 per cent married; 6.5 per cent widowed.

It is difficult to make a clear distinction between rural and urban population, because in northern Italy the peasants live scattered, while in the southern part they live in villages. In 1901 11 communes with over 100,000 had a population of 3,208,095; 23 between 50,000 and 100,000 had 1,514,579; 52 between 30,000 and 50,000 had 1,988,764; 76 between 20,000 and 30,000 had 1,790,747; 88 between 15,000 and 20,000 had 1,521,340.

Principal cities: Rome (1904), 489,965 population; Naples, 550,369; Milan, 520,600; Turin, 335,656; Palermo, 309,694; Genoa, 234,710; Florence, 205,589; Bologna, 152,009; Venice, 151,840.

Marriages, 1905, 255,873; births, 1,084,518—legitimate, 1,025,663; illegitimate and exposed, 58,855; deaths (exclusive of still-born), 730,340; surplus of births, 354,178. (See **MARRIAGE; BIRTH AND DEATH-RATES.**) Italy has lost

largely by emigration: 533,245 in 1901, 726,331 in 1905, and 787,977 in 1906. The relative majority of the emigrants in 1901 went to European countries, in 1905 to the United States—the figures being: 244,298 and 121,130; 266,982 and 316,797 respectively. Paraguay and Brazil had the next largest percentage, the former 88,840 and the latter 30,079 in 1905. The department of Venice lost (1905) 3.25 per cent of its total population; that of the Abruzzi and Molise, 4.07; and that of Calabria, 4.43. The whole kingdom lost in 1906—2.36 per cent of its population.

RELIGION.—Roman Catholicism is the religion of more than 97 per cent of the population. The hierarchy numbers—aside from the pontiff and the cardinals—50 archbishops, 216 bishops. In 1901 the number of parishes was 20,707; of secular clergy, 68,844; of regulars (monks, nuns, and lay brothers), 48,043; scapulars, etc., 12,129. All religious houses were suppressed in 1866, tho a small pension was given to all who had taken regular religious vows before Jan. 18, 1864, and a few monasteries were temporarily set aside for such as wished to continue conventual life. All other property was appropriated by the State. The constitution enacts that the Catholic, Apostolic, and Roman religion is the sole religion of the State. By a royal decree of 1870, Rome and the Roman provinces were declared an integral part of the kingdom of Italy; the Pope was acknowledged supreme head of the Church, ranking as a sovereign prince. There was guaranteed to him and his successors forever the Vatican and Lateran palaces and the Castle Gandolfo, with 3,225,000 lire annually, which allowance still remains unclaimed and unpaid. The State grants freedom of service and conscience to other religions; the small body of 22,500 Waldensians are more active than ever, and several Protestant denominations are doing mission work. About 30,000 Protestants belong to foreign bodies. There are, moreover, 35,617 Jews; 36,092 agnostics and atheists; and 795,276, or 2.45 per cent, unknown.

The Church of Rome

EDUCATION.—The State regulates public instruction, and no person can keep a school without State authorization. Compulsory, universal education is of recent date in Italy. Before unification education was mainly left to the Church, which did but little. In 1862 the percentage of illiterates over twenty years of age was, for men, 65.5; women, 81.5; in 1901, 43.8 and 60.4 respectively. The percentage of illiterate conscripts decreased from 47.7 in 1881 to 31.3 in 1904. In 1901 the largest percentage of illiterates over six years was, in Calabria, 78.7; the Islands, 70.4; South Italy, 69.7; Middle Italy, 51.5; Upper Italy, 28.3; the smallest in Piedmont, 17.7. The attendance at elementary schools from 1865 to 1905 increased from 1,000,000 to 2,733,000, or 121 per cent. Illiterates born after 1885 are unable to enlist in the army and to vote for deputies; or—if born after 1890—to carry on any business under police supervision. Evening and Sunday schools for illiterate adults are established. The school age limit—from six to nine—has been increased to six to twelve in the majority of communes since 1904.

The present system of education provides for: (1) elementary instruction; (2) secondary instruction—classical; (3) secondary instruction—technical; (4) higher education. The system is based largely on that of Germany with elementary schools, gymnasia, the so-called technical schools and institutes partly analogous to real-schulen, and universities. In 1899 the total expenditure for education was 68,440,830 lire for elementary instruction alone. Technical education has developed rapidly. (See **EDUCATION, TECHNICAL EDUCATION, AND UMANITARIA.**) In 1907 the State budget assigned 66,189,273 lire for education.

OCCUPATION.—The majority of Italians live in the country or small villages. Excluding children under nine years, the principal occupations in 1901 were: Agriculture, forestry, and cattle-raising, 9,611,003 people; clothing and adornment, 1,113,843; textile industries, 783,253; renters (i. e., people living on incomes), 600,752; building, 564,798; domestic service, 482,080; dependents, 8,355,773. Total (including scattered), 25,386,507.

The number of proprietors in 1901 was: total, 4,110,133; of lands, 1,045,113; of buildings, 823,442; of both, 2,241,578. Land is largely divided, the large estates exist in many sections. Peasant proprietorship prevails in Piedmont and Liguria; partnership between the proprietor and cultivator, especially on the form of the *mezzadria*, where profits and losses are equally divided between the two, prevails in Tuscany, Umbria, and the Marches; rented farms prevail in Lombardy and Venetia.

INDUSTRIES AND MANUFACTURES.—Of the total 28,668,221 hectares (hectar = 2.47 acres) 20,248,000, or 70.6 per cent, are productive, 16.2 per cent unproductive, and 13.2 produces little or nothing. Agricultural methods were antiquated until comparatively recently. Progressive methods, however, have now been introduced in many provinces under the guidance of experimental stations and agricultural schools. The chief products in 1905 were in *hectolitres* (each = 2.75 bushels; liquids, 22 gallons): wheat, 56,290,000; maize (corn), 35,010,000; rice, 8,584,000; wine, 27,878,886; olive oil, 3,412,000. The tobacco crop in 1904

Industries

Agriculture

was 6,107,280 kilograms; acid fruits (1903), 5,250,000,000 kilograms. From 1900-4 the annual production of silk cocoons averaged 53,500,000 kilograms; that of raw silk, 5,200,000. Silk culture is flourishing particularly in Piedmont and Lombardy, and to a less extent in other provinces. The sugar-beet industry is growing. In 1898-99 the output of 4 factories was 7,960 metric tons; in 1905-6 that of 33 = 93,916 (1 metric ton = 2,204 pounds).

Forestry is managed under the Ministry of Agriculture. The forest area—exclusive of chestnut plantations—is about 4,093,000 hectares. The annual yield in lumber, firewood, charcoal, etc., excluding chestnuts, is about 88,000,000 lire.

Mining is not important. Sixty-three thousand nine hundred and ninety-six workers produced sulphur ore, zinc, lead, iron, mercury, etc., of 88,942,669 lire value in 1905. Mining is becoming more important. The quarries employed 59,342 men.

Fisheries gave employment (1904) to 94,684 men; vessels, 24,264.

The commerce of Italy consisted in 1905: imports, 2,078,380,000 lire; exports, 1,707,368,000. The exports consisted chiefly of raw silk, 476,947,000 lire; cotton tissues, 79,900,570; silk tissues, 78,976,784; hemp and flax, 45,099,934; silk waste, 45,140,500. Imports: raw cotton, 247,603,690 lire; cereals, 183,980,740; coal and coke, 164,157,245; machinery, 99,554,444; lumber, 73,161,960.

The mercantile marine consisted (1905) of 5,596 vessels of 1,032,614 tons—steam vessels, 513; sailing vessels, 5,083. Genoa is the principal harbor, Naples second, Leghorn third, and Palermo fourth.

II. Constitution and Government

The present king is Vittorio Emanuele III., who succeeded to the throne July 29, 1900. The present constitution dates back to March 4, 1848, to a statute given by King Carlo Alberto to the kingdom of Sardinia. This has been gradually expanded to meet the demands of United Italy. It gives the executive power to the king, with his ministers. The legislative power belongs to Parliament, consisting of a Senate and a Chamber of Deputies, which the king must convoke yearly, but which he may dissolve. Both houses have the initiative; in money matters, the Chamber alone. The Senate is not fixt in numbers; it consists (1906) of 358 members; and five princes are appointed senators by the king for life.

The deputies—508 members, or 1 to 64,893 of the population—are elected by conditional universal suffrage for five years; they must receive at least one sixth of the voters inscribed in their electoral districts, and half the votes given; they cannot be salaried officials of the State. Officers in the army and navy, secretaries and under-secretaries of state may be elected, but their total number must not exceed forty. The only compensation which senators and deputies receive is free transportation on railroads. There is a movement on foot now for granting compensation to deputies.

Electors must be citizens; twenty-one years old; able to read and write; or, if illiterate, pay not less than 19.80 lire in direct taxes, or an equivalent amount of rent on the farms. The proportion of electors to male inhabitants over twenty-one years of age (8,711,542 in 1901) is about 29 per cent. The number of persons who had the right to vote was (1904) 2,541,327—exclusive of 260,566 soldiers—or 7.6 per cent of the total population; the number of actual voters was 1,593,886, or 62.7 per cent of the inscribed voters.

Political parties are usually divided into *Right* and *Left*, Radicals and Socialists. The composition of the Chamber is (1907): Ministerialists (Center), 300; Prime Minister Giolitti.

Parties Opposition, 100; Leader, Sonnino. Radicals, 40; Leader, Sacchi. Republicans, 22; Leader, Colajanni. Socialists, 29; Leaders, Ferri and Turati. The extreme Right is in opposition and frequently votes

with the extreme Left (Radicals, Republicans, and Socialists).

Italy is divided into sixty-two provinces, and these into territories or districts, and these into communes (8,290 in 1906). The head of the commune, a government officer, is assisted by an elected municipal council, who in turn elect the head (syndic). There are also provincial councils. Direct taxes are on lands,

houses, incomes; indirect taxes, e. g., customs, octroi, on manufactures, monopolies on salt, tobacco, and the lotto. The principal expenditures are: payment of various debts for army, navy, and administration. Total revenue 1905-6, 2,464,781,059 lire. Expenditures, 2,399,497,487. Surplus, 65,283,572.

The total length of Italian railways is 10,070 miles; 8,100 of these were (June 1, 1906) owned and operated by the State. Total receipts in 1905-6—406,943,335 lire; 1903: receipts, 360,225,110 lire; expenses, 260,583,111; surplus, 99,641,990. Of the receipts in 1903 the amount of 134,463,959 lire was from 68,031,332 passengers. (See RAILWAYS.)

There were 8,817 post-offices and collecting boxes on June 30, 1904. Receipts 1905-6 were: 82,032,760 lire. A recent reform in the postal service has produced good results, both in increasing the receipts and traffic.

The total length of telegraph lines on June 30, 1904, was 29,640 miles with 116,710 miles of wire. Receipts in 1905-6 were 18,484,088. A law of June, 1907, has nationalized the telephone service, both urban and interurban.

The army of Italy is modeled after that of Germany. The period of service is 19 years—2 or 3 years in the ranks, 5 to 7 in the reserve, 3 or 4 in the "mobile militia," 7 in the territorial militia.

The peace strength is 264,516; that of the reserve, 492,255; mobile militia, 307,696; territorial militia, 2,222,637.

The navy has a personnel of 1,799 officers and 25,000 men. The budget of 1906-7 allowed for the army 277,108,173 lire; the navy, 123,383,973. (See article MILITARISM.)

III. Social Reform

Social reform in Italy, more than in most countries, is made up of distinct movements which tho of necessity touching at many points and occasionally cooperating, are totally distinct in origin, character, method, and in personnel. These different movements may be divided into those connected with cooperation, with socialism, trades-unionism, and with the government.

Of these the first, tho quite modern in recent developments, is in reality the oldest, and largely began in the thoughts and ideals which clustered around the great name of Mazzini.

Social reform in Italy through all the first part of the nineteenth century was almost confined indeed to the efforts made in various ways by patriots like Mazzini and Garibaldi, by societies like the Carbonari, mainly working to secure liberty and Italian unity. (See MAZZINI; CARBONARI.) Mazzini opposed socialism as presented in his day as being materialistic, anti-nationalistic, and standing for personal rights rather than for cooperation and duty; but his position on almost all subjects was that of modern

ethical socialism, and his followers in Italy have done much to develop reform of this kind. In

Cooperation

1861 a *Fratellanza Artigiana* (Artizan Brotherhood) was started in Florence connected with Mazzini's name to develop cooperation through Italy. This hope was not realized, owing to political jealousies; but its influence still survives. In 1871 a pact of working men's societies, *Patto di Fratellanza*, was formed at Rome, also drawn up under the auspices of Mazzini. It held its eighteenth general congress at Palermo in 1892.

Cooperation in Italy, however, soon turned into more practical channels, English and German, altho with characters of its own. In 1886 and 1887 congresses of Italian cooperators met in Milan and formed an Italian Federation, and a journal was started, *La Cooperazione Italiana*. One of the most characteristic successes of cooperation in Italy has been among the day-laborers, owing largely to the campaign for this purpose inaugurated in 1888 by Signor Marin. (See COOPERATION.) Cooperation has also spread somewhat among the peasants of the villages in some districts. Distributive cooperation seems to have begun in Turin as early as 1853, and to have had no little success, especially in the cities of northern Italy, notably Milan.

At the close of 1904 there were in Italy some 4,600 cooperative societies, of which 1,080 belonged to the cooperative alliance of Milan. (For other statistics, see COOPERATION.)

The cooperative movement, however, recently has taken on a very wide range, connecting itself with movements for housing reform, rural reforms, public employment agencies, the question of unemployment, the aiding of unemployed workmen in the towns to migrate to the country districts where emigration, etc., have caused a lack of laborers. This broader range of the movement has been much aided by the *Società Umanitaria* of Milan, the unique and powerful creation of Mr. Moise Loria, who gave ten million lire, increased by interest to about thirteen million lire (\$2,600,000). The society was incorporated in 1893, but only began effective work in 1901. Its aim is the relief of the laboring classes, by furnishing aid, employment, and education. The society has already established or extended a series of schools for the artistic trades, electro-technics, printing, and allied trades. It has promoted circulating libraries, established a loan bank for cooperative societies, created employment bureaus for rural laborers. It invests its funds in model dwellings for the working classes, has a fund for insurance against unemployment, and has published important reports of investigations as to unemployment and other vital questions. (See UMANITARIA.)

The second movement in Italy is the Labor movement, partly political and partly on trade lines. It began in Italy on political and afterward anarchistic lines, in connection with the old International (*q. v.*).

Bakunin (*q. v.*) founded a section of the International at Naples in 1867, and established a paper, *Equity*. Other sections were formed in Genoa, Milan, and Italy. This movement opposed the Mazzini societies and developed strength enough to frighten the government into suppressing the sections in 1871. It sprang up again, however, till finally again suppressed in 1875. It represented anarchist communism rather than socialism. In 1882, however, the

Italian franchise was widened, and in 1885 an Italian Labor Party was formed at Milan, partly socialistic, partly anarchistic, and won strength enough to cause it to be dissolved by the government in 1886. A new Labor Party (*Partito dei Lavoratori*), however, was formed at congresses in Milan and Genoa in 1891 and 1892. In 1893 the party held a second congress at Reggio (Emilia), when it assumed a distinctly Socialist attitude, and adopted the name of Italian Laborers' Socialist Party (*Partito Socialista dei Lavoratori Italiani*). It stands for Marxist socialism, but in Italy as elsewhere the movement has developed two wings, the "*tranciganti*" and "*in-tranciganti*," or as they are now usually called in Italy "*Riformisti*" and "*Rivoluzionari*," the present main leader of the former being Turati, and of the latter, Enrico Ferri. Italian Socialists,

Socialism

however, have been more turbulent and anarchistic in method than most modern Socialists. Strikes and even rioting have played a large part.

Not to speak of the semirevolution of the "*Fasci*" (Land League) in Sicily (1893-94) and among the Carrara marble workers (1894), there were bloody riots in Milan and elsewhere (1898), with the great Genoa strikes of 1900, besides 382 other strikes in that year and numerous desultory agricultural strikes in 1901-2. In 1904 a strike in Sardinia led to a collision with the troops and some strikers were killed. A mass-meeting organized by the Chamber of Labor of Milan, in which city the revolutionary party was dominant among the Socialists, summoned the working classes of all Italy to a universal strike. This broke out in almost all the large cities and many smaller ones, sometimes not extending to the public services, but sometimes affecting every class of the population. There were collisions of troops with the strikers or more commonly the lawless element who took advantage of the strike. The extent of the strike has never been equaled in Italy. It did not, however, endure, lasting in Milan only five days. It created a reaction against the progressive parties, and the government chose the opportunity to dissolve the Chamber of Deputies. In the ensuing elections, the popular parties were not united; in places there were even two Socialist candidates. The platform was the strike, and the government took for its watchword "neither reaction nor revolution," and won. Since then Italian socialism has been less turbulent, and the extremes of the party have been modified and more united. (See SOCIALISM.)

Allied to this Socialist movement, tho in some ways distinct from it, are the Italian labor organizations or unions. These are of two kinds, the *Federazioni* or *Leghe di Resistenza*, unions of the working men in a trade, and the *Camere del Lavoro*, analogous to the trades councils of England and the *Gewerkschaftskartelle* of Germany, unions of workmen in a town. The *Federazioni* are more concerned with trade disputes and measures, the *Camere* with the more general and local questions affecting the laboring classes—cooperation, factory laws, popular education, mutual insurance, municipal action. The *Camere* often establish labor bureaus and cooperative institutions. These organizations are guided by a *Segretariato centrale della Resistenza*, with officers in Milan composed of three representatives of the *Camere*, three of the *Federazioni*, and ten secretaries. In Dec., 1904, there were 77 *Camere*,

some 33 of them, however, with only a nominal life. The Federazioni belonging to the Segretariato are 29 with a membership of 205,362. The clubs of the civil service of the cities are organized in 14 Federazioni with 110,000 members, and about 100 Camere. These unions support about 50 weekly, fortnightly, or monthly papers.

Organizations of agricultural laborers have attained in Italy a greater importance than in any other country. They have played a large part in

Trade- Unions

the rural strikes, and are at once the source and the result of a very important revival of rural life chiefly in Mantova, the Emilia and Romagna.

They, too, are formed into a Segretariato. Their total membership was 221,913 in 1906, and has increased to 273,698 in 1907. Among the Federazioni the more important are those of the railway men (56,000 members), building trades (24,000), metal trades (30,000), printers (9,000). Italian unions have not developed the benefit system except for strike benefits, while the hatters and printers give out-of-work benefits. Collective bargaining is increasing in Italy, even in agriculture, employers entrusting their fields to be cultivated by the unions. (See TRADE-UNIONS.)

The third class of reform movements in Italy are connected with the government.

Italian political parties formerly consisted in the main of a Right, long led by Crispi, the monarchical and conservative party of Cavour, and a Left, the liberal and democratic (or Republican) party gathered around the name and traditions of Mazzini. Except for three years (1891-94) Crispi remained in power till 1896, when the defeat of the Italian forces in Erythria and growing discontent defeated him, and Rudini, to some extent supported by the Radicals, formed a ministry. General Pelloux, however, in 1898, succeeded him with a Liberal cabinet, supported by many Conservatives. Demand for reforms, however, went on; socialism developed; and in the election of 1900, after the riots of 1898 and the parliamentary struggle of 1899, the popular parties (Radicals, Republicans, and Socialists) won 100 seats and overthrew the cabinet. A transitional cabinet was defeated before the end of the year, and the semi-democratic Zanardelli-Giolitti cabinet was formed. Labor was free to organize—a new thing for Italy. The cabinet was not, however, always supported by the democratic parties. The Socialist Rivoluzionari openly attacked the government. However, the government carried bills regulating the labor of women and children, creating a Labor Bureau, municipalizing public services, on accidents in industry, old-age pensions, salaries of elementary teachers, of clerks in various branches of the civil service, pensions for workmen in the government tobacco manufactory. It enacted laws on public health, housing, convict labor, cooperative societies, public works, a new penal law, a law reorganizing the municipal finances of Rome (with a rate on vacant land), progressive laws for various particular sections and trades, besides a remarkable law on charities. The main labor problems, however, the reduction of taxation for the laboring classes, divorce, the lowering of duties on corn, it feared to attempt. Nevertheless it was a great advance.

In 1903 Zanardelli, however, had to resign for reasons of ill health, and Giolitti formed a minis-

try with the cooperation of Luzzatti as minister of finance. The Radicals and Socialists, however, increasingly opposed the government; Socialist riots broke out; the Premier seized the opportunity to dissolve the Chamber; the pope for the first time advised Catholics to enter politics; the result was that the reaction won. In 1905 Giolitti resigned and Fortis became minister.

The main act of his ministry was the passage of the government bill to nationalize the railways July 1, 1905. All the Italian railroads were passed over to the State, except some 2,000 kilometers of the southern railways of the Adriatic Company and some 2,000 kilometers of secondary lines. The price was somewhat over 500,000,000 lire, by assuming the railway debts of some 76,000,000 lire, loans from banks of 215,000,000 and forty years coupons for 200,000,000 lire at 3.65 per cent interest. The measure was criticized by the Socialists and trade-unionists, who created against it a general but ineffective railway strike, demanding the substitution of important different details. The strike failed and the bill passed, the government promising an inquiry.

The Fortis ministry, however, was defeated in Feb., 1906, and Sonnino became Premier, promising especially to raise the economic condition of the southern peasants and to reduce the land tax in the south, including Sicily and Sardinia, 30 per cent. In May, however, he was defeated on a detail and Giolitti returned to power.

Through all these changes, however, the government has continued more or less steadily its reforms. The Labor Department under Prof. Montemartini has done able research and statistical work and has advanced many measures. A government board of emigration has done much to guide and protect Italian emigration and in part to direct it into migrations to Italian rural provinces in need of labor. The government has at least wrestled with the problem of the economically depressed and oppressed south; a bill has been passed to aid the development of working men's dwellings, and agricultural centers have been formed. Thus a new progressive Italy is emerging. It has been said that in no country does socialism so affect the national life as in Italy.

Besides these main channels of reform, a few other movements may be noted. The Church of Rome in Italy (for political reasons refusing to recognize the government) has not developed an avowed Christian socialism, as she has in many countries, and in 1905 (see above) a papal encyclical exhorted Catholics to enter politics, to defeat socialism, and work for the interests of the Church. In some ways, however, the Church has been compelled in self-defense to favor education and be more active in relief and charity (which in Italy has always largely been in ecclesiastical hands). Some bishops have made progressive utterances.

Industrial betterment has little hold in Italy, the much attention is now being given to working men's dwellings. (See UMANITARIA.)

Italy has two industrial villages. Crespi, near Capriate, Lombardy, has both block dwellings and single or double cottages, but all with small gardens and open spaces, and both classes of dwellings rented for four lire a week. In the center are church, orphanage, public laundry, and schools. The other village is Calabria, built by Achille Fazzari. Both are for cotton-mill workers.

For Italian poor relief and charity, see article **PAUPERISM AND POOR RELIEF**.

Nevertheless, in spite of these reforms, poverty in Italy is great. The annual income in Italy per head is less than \$40 to \$155 in Great Britain, \$130 in France, \$102 in Saxony, \$85 in Prussia, \$40 in Austria. The usual wage for unskilled labor is from 16 to 29 cents per day. Taxes are heavy, and fall heavily on the poor. Since 1860 wealth is said to have increased 17 per cent, but taxes 30 per cent. Until very recently, Radicals in Italy could compare an annual 800,000 lire voted by the government to assist agriculture and 71,000,000 expended on army and navy. To-day it is little better. Taxation in Italy is said to be higher than in most other countries, and to absorb almost one fourth of the incomes of the country. In Venetia women work in the poorest regions in the fields for 12 cents per day. In the south, however, is the more poverty. In Sicily peasants get 17 cents per day, with about 4 cents' worth of beans and macaroni. But worst of all, in the sulphur mines of Sicily conditions are lower still. Even in the mines in Sardinia miners get scarcely 40 cents a day, and women and children 12 cents. In the south of Italy, however, conditions are very much better and great progress is being made.

Some of the leading Italian social reform societies are:

Associazione degli Industriali d'Italia per prevenire gli infortuni del lavoro. Milano, Italy.
Congregazione di Carità. Ufficio Centrale 14 via di S. Chiara, Rome.
La Camera del Lavoro, Milano.
L'Ufficio d'Indicazione e d'assistenza del l'Unione Femminile. Milano.
Segretariato Centrale delle Camere del Lavoro. Via Crocetta, Milano.
Segretariato Nazionale della Resistenza. Milano, Italy.
Società Cattolica Italiana per gli Studi Scientifici. 76 Via Torre, Argentina, Roma.
Società Umanitaria. 9 Via Alessandro Manzoni, Milan.
Ufficio del Lavoro (Labor Bureau). Ministero de Agricoltura, Industria e Commercio, Roma, Italy.
Unione Cooperativa. Via Carlo Alberto, Milan.
Unione Operaia, delle Associazioni Indipendenti—Società Centrale Operaia Napoletana, Comitati Lavoro di Napoli e Province. Borsa del Lavoro. Naples.
Consiglio superiore della beneficenza, Ministero dell'Interno, Roma.
Società anonima cooperativa "de industrie femminili," Rome.
Lega industriale, Turin.
Confederazione nazionale del lavoro, Turin.
Lega nazionale delle società cooperative, Milano.
Commissariato dell'emigrazione, Rome.
Consorzio per la tutela dell'emigrazione temporanea in Europa, Turin.
Unione popolare (Roman Catholic), Bergamo.

J

JACQUERIE: In May, 1358, rebelling against the tyranny of Charles the Bad of Navarre and of the nobility, the French peasants rose in revolt during the imprisonment of John II., the Good, in England. The revolt commenced near Paris, but spread to the Marne and the Oise, and for three weeks carried all before it; but in June it was put down with great slaughter at Meaux. The name comes from the Jacques or clowns, used for peasants, from the Christian name Jacques, supposed to be peculiarly a peasant name.

JACOBSON, VLADIMIR R.: Russian representative (Group of Toil) of the Grodno Province in the First Duma; born 1861; Jew; lawyer of the city of Slonim, graduate of the law school of St. Petersburg University. Member of the committee for the investigation of the pogrom in Bielostock.

JAMES, EDMUND JAMES: Economist; president of the University of Illinois; born 1855, at Jacksonville, Ill.; educated Illinois State Normal School, Northwestern University, Harvard College, Berlin, Leipsic, Halle; 1887-95 professor of public finance and administration in the Wharton School of Finance and Economy, University of Pennsylvania, and 1884-95 professor of political and social science; 1891-95 president of the American Society for the Extension of University Teaching; 1896-1901 professor of public administration and director of Extension Department University of Chicago; 1902-4 president Northwestern University; 1904 president of University of Illinois; 1889-1901 President of the American Academy of Political and Social Science; 1890-5 editor of the *Annals* of the Academy.

He was one of the first to take part in the movement for the improvement of city politics

in the United States, and one of the organizers of the Municipal League of Philadelphia, serving as its first president; author "The Relation of the Modern Municipality to the Gas Supply" (1886); "The Canal and the Railway" (1890); and over 100 papers, articles, and monographs in economic and other journals. Address: Urbana, Ill.

JANNET, CLAUDIO: Lawyer; professor; born at Paris 1844. He became a lawyer at Aix and later professor of political economy at the Catholic University of Paris. Some of his principal works are: "De l'état présent et de l'avenir des associations coopératives" (1867); "L'Internationale et la question sociale" (1871); "les Institutions sociales et le droit civil à Sparte" (1874); "les États Unis contemporains" (1875); "les Faits économiques et le mouvement social en Italie" (1889); "le Socialisme d'État et la réforme sociale" (1889); "le Capital, la spéculation et la finance au XIX^e Siècle" (1892). Jannet belongs to the school of Le Play.

JAPAN: After the gigantic struggle with Russia, the nation has welcomed back her million soldiers who went to the front with *Bansais* and triumphal arches in every town and almost every rural village.

The nation is sobered, but resourceful, and hopeful for the future. Japan is making large plans for the extension of its commerce and manufacturing industries. The great victories of the war have confirmed Japan in a place of equality with the Western nations. The new Anglo-Japanese Treaty for Alliance still further emphasizes Japan as a world-power, and is a guaranty of general peace in Eastern Asia and in India.

Japan has assumed a protectorate over Korea and Southern Manchuria, and has gained a preponderating influence over China, as shown by the fact that thousands of educated Japanese are teaching in the new provincial schools in China, and also drilling her armies, and that more than 10,000 Chinese are studying in the higher schools of Japan. This new and widening sphere of work and influence is a great incentive to Japan to do her best in meeting her new responsibilities.

An unsuccessful struggle has been going on for years to secure party government. The present

Political Parties

cabinet is a compromise, complex cabinet. The *Seiyukai*, the successor of the old Liberal Party, is the strongest, having about 150 seats in the Lower House. Marquis Saionji, the prime minister, and two members of the present cabinet belong to this party.

The Progressive Party, led by Count Okuma, holds nearly 100 seats in the Lower House. The "Daido" Club is made up of small heterogeneous parties, and holds about eighty seats in the Lower House.

Manufactures, especially of silk and cotton spinning and weaving, are increasing with great rapidity. There are now 350 manufactories in Japan, with a capital of over 400,000,000 yen.¹ There are about 400,000 operatives employed in these factories, two fifths of whom are men and three fifths women. About 34,000 of these operatives are under fourteen years of age. They work from twelve to fourteen hours a day, resting only on the first and fifteenth of each month. In some factories they work sixteen or seventeen hours a day. The men receive about fifteen cents and the women about ten cents a day.

There are nearly 165,000 working in mines. In 1904, of these, there were killed 267, and 323 severely and 629 less severely injured. Three million people are engaged in fishing.

Industries

In 1904, 301 of these were killed, 73 wounded and 270 missing. There were taken during that year 44,000,000 yen worth of fish and 31,000,000 yen worth of other marine products.

Japan has a population of about 300 to the square mile, but as only 15 per cent of its area is under cultivation, it has a population of about 2,000 to each square mile under cultivation; 76 per cent of the population is rural, but the urban population is increasing; 63 per cent of the population are tillers of the soil; 40 per cent of the tilled land is worked by tenants, and the tenant gets only about 40 per cent of the produce.

The average market value of tilled land is 720 yen an acre. One man tills only one or two acres. About one half of the land is tilled exclusively by manual labor without the use of horses or oxen. An acre yields about thirty bushels of rice and about twenty bushels of barley, the one raised in the summer and the other in the winter. Thus an acre produces about thirty yen worth in a year, on an average.

There is provision made by mine owners for miners when sick or injured, and in case of death aid is given toward the funeral expenses, and also a small allowance to the families. Some of the large mining companies give more than 1,000,000 yen a year to disabled miners, and a like sum to bereaved families. This system is being followed to some extent by some of the railroad companies,

but not to any large degree by factories. Mine Workers' Mutual Aid Associations are formed in many of the mines and members pay a certain sum each month, and mine operators and other friends contribute, and help is given from these funds in case of illness, injury, or death of any member.

A large tide of emigration has for many years set toward the northern island, the Hokkaido. The same is now true in regard to Korea and Manchuria. It is doubtful if the number emigrating to Hawaii and the United States will continue to be as large in the future as in the past.

Each prefecture has a relief fund and the State hands over each year to each prefecture an amount proportioned to that set apart by the prefecture. This fund is used when

Charities

any calamity occurs within the limits of the prefecture. The State also makes disbursements for paupers and foundlings. An aggregate relief fund of about 30,000,000 yen exists at the present time in the several prefectures.

Over 15,000 paupers are aided by the State each year, at an expense of over 200,000 yen.

The following statement is made in the Japan Year Book for 1906, page 457:

It is a significant fact that by far the greater part of private charity work of any large scope is conducted by Christians, both natives and aliens, and that the part played by Buddhists in this direction is shamefully out of proportion. As to Shintoists, they are privileged, in popular estimate, to keep aloof from matters of this kind.

This is significant as coming from the Japanese editor and compiler of the Year Book.

The four leper hospitals in Japan are all conducted by foreigners. Mr. Hara's Ex-Convict Home, in Tokyo, is the largest and most successful of all the forty-three such homes in the country. Mr. Hara was converted while in prison, and he has been engaged in this work for twenty-two years. During the last nine years he has received into his Home 768 ticket-of-leave convicts. Of these 54 are now in the Home, 414 are self-supporting in honest work, 65 have died, 116 are missing, that is, their whereabouts not known, and 119 have left the Home unreclaimed. The emperor has recently given 1,000 yen to this Home. Mr. Tomeoka's Christian Reform School and Home for Boys in Tokyo has also received a gift of 1,000 yen from the emperor.

The Okayama Orphanage is the largest of the nearly thirty orphanages in Japan. There are over 1,200 children now in this institution, which needs greatly increased equipment in buildings and endowment. The emperor and empress gave to this institution, two years ago, 2,000 yen and promised 1,000 yen a year for ten years.

The Red Cross Society in Japan is the most remarkable organization in the empire. Started in 1886, when Japan joined the Geneva Convention, it now numbers over 1,100,000 paying members, with a fund on hand of over 10,000,000 yen. During the late war, 4,500,000 yen were used for Japanese patients and Russian prisoners.

A Japan Woman's League has been formed which has 500,000 members. This league did much during the late war in comforting sick and wounded soldiers and aiding their families. About 10,000,000 yen were expended during the war by relief societies, in aiding disabled soldiers and soldiers' families.

The great famine which came upon three provinces in the north, last year, affecting a million

¹ The Japanese yen is equal to fifty cents.

people, was met by over 100,000 yen from foreign countries, more than one half of which came from the U. S. The Japanese, including the imperial gift of 50,000 yen, raised about 400,000 yen. Local governments voted funds to be used in public works to the amount of nearly 4,000,000 yen, and 3,000,000 yen in national and local taxes was remitted. An abundant harvest this year throughout the empire makes all hearts glad.

The government is buying seventeen railways at a cost of about 424,000,000 yen. These roads comprise a mileage of 2,806 miles, making, with former government lines, an aggregate of 4,466 miles, and leaving only a little over 400 miles operated by small private companies. The government owns all the telegraph lines

Public Ownership

and some of the telephone lines, and operates them in connection with the Postal Department. The government also has a monopoly of salt, camphor, and tobacco.

The public-school system is very thoroughly organized and the attendance is very general; 94.43 per cent of children of school age are in school, or else have finished the ordinary elementary school. Only 15 per cent of the teachers are women.

Teachers who have served for fifteen years are entitled to a life pension of one fourth of their salary, on becoming sixty-five years of age, when disabled by sickness, and in other special cases. If a teacher has served more than fifteen years, $\frac{1}{15}$ is added for each year. The middle

Education

schools are able to receive only about 60 per cent of those who apply, after graduating from the grammar schools. The high schools, also, are able to receive only about 36 per cent of the graduates of the middle schools who apply. There are now ninety-five higher girls' schools with nearly 30,000 scholars. Two thirds of the teachers in these schools are women, and the proportion of female teachers in the other schools is gradually increasing. Women are also being employed in post-offices, banks, and railroad ticket offices.

The National Temperance League has ninety-eight affiliated societies with a membership of 8,517. A bill prohibiting the use of any and all kinds of liquors to minors, after passing the Lower House, was defeated in the House of Peers by 106 to 97, and the matter was referred to the Educational Department.

The Woman's Christian Temperance Union has affiliated with it sixty-three local unions with a membership of nearly 3,000.

Meetings have been widely held by both of these organizations, and much valuable literature has been published and distributed.

A Rescue Home, capable of caring for forty girls, has been completed in the capital and fourteen girls have been in it. About 30,000 "comfort bags" were sent to the soldiers, in which were sent over 200,000 copies of temperance and religious literature.

Social Reform

The W. C. T. U. is doing a much needed work in calling attention to the facts concerning the immorality in many of the schools for young men, by means of which young women in some of the higher schools, especially in the capital, have been led astray.

The conditions in the schools is such that the Minister of Education issued an "Instruction" last June, from which I quote:

It is scarcely necessary to say that the duty of scholars and students is to have a steadfast mind, to propose to themselves a fixed purpose, and to look forward to achieving great results by zeal and diligence. Nevertheless, among the youths of both sexes I detect, to my great regret, a tendency to occasional dependency and to ethical decadence. Certain of those now in the schools show an inclination to luxury or to torment themselves about empty theories, or, in extreme cases, allow their minds to become absorbed in dissipation, and, violating the precepts of virtue, lose their sense of shame. Unless steps be presently taken to severely reprimand these errors, their harmful results will be incalculable. There are signs that the trend of a part of society is toward insincerity and that the youths of both sexes are being led astray in increasing degree. Especially is this the case with recent publications and pictures, for these either ventilate extreme doctrines, inculcate pessimistic views, or depict immoral conditions to the no small detriment of education.—*Japan Year Book*, p. 448.

During the last two years an increasing number of student young men committed suicide, having adopted pessimistic ideas of life. They threw themselves over the 250-foot Kegon waterfall, and into the craters of active volcanoes. Two young men and one young woman thus threw themselves over the Kegon fall the week the writer was there, a short time ago.

The social conditions of some of the boarding-houses of the great factories are deplorable, as are those of some of the smaller weaving-houses. Take the great "Nishijin" weaving district in the northeastern part of the city of Kyoto. There are said to be 60,000 operatives in that district. A large part of them are girls and boys who are apprenticed by their parents for a term of three years, and some of the girls apprenticed over three times. Many of them are crowded together at night, boys and girls in the same rooms, with deplorable results. One Christian physician in the city has cared for nearly 400 of these unfortunate girls in one year, during their confinement. The efforts of Rev. U. G. Murphy and others, begun several years ago, to secure freedom for girls who have been sold to a life of shame, to quit such life, have already resulted in its abandonment by about 20,000, out of a total of 70,000 in the empire; and if the Supreme Court gives a favorable decision in a case now before it, as to whether a girl can leave her place of detention although there are debts standing against her, there will be a still further and more rapid diminution of these unfortunates, who are in durance vile. As it has been, the keepers of these houses managed to keep a girl constantly in debt. The Salvation Army, in addition to its other laudable work, is doing a good work in assisting girls to leave a life of shame. They have brought 129 girls to Tokyo from the famine region, during the last year, and placed them in suitable situations, most of whom would otherwise have been a prey to those seeking victims for immoral purposes.

Shinto is disestablished and virtually declared not to be a religion. There are, however, over 80,000 Shinto priests, and the "solemn ceremony of the emperor in person at the great shrines of Ise for the purpose of proclaiming to the imperial ancestors the happy termination of the war has exerted a more or less powerful influence on the minds of the general public in favor of Shintoism."

Of Buddhism, the Japan Year Book says (page 451): "On the whole, the world of Japanese Buddhism remains stagnant." Then, after speaking of the efforts of the most popular sect to minister to the soldiers in the late war, and of three priests who went to Tibet to study the Lamaic branch of Buddhism, it continues: "In

contrast to these worthy undertakings, the chronic scandal of the East Hongwanji continues to seriously impair the credit of Buddhism as a whole."

The reference here is to the alleged squandering of the revenues of this richest temple in Japan, so that it is said to be some millions of yen in debt and some of its property has been seized by the creditors.

There are, however, at present over 70,000 officiating Buddhist priests.

In regard to Christianity, it is to be said that the late war has sobered the nation, and there is a marked desire on the part of the people, especially among young men, to examine Christianity and listen to its teachings. The gifts of the emperor to distinctively Christian institutions and the magnificent and unparalleled success of the Young Men's Christian Association among the soldiers in Manchuria are having a wide and powerful influence in favor of Christianity. Most of the leading generals were favorably impressed and the returning soldiers have carried favorable impressions of Christianity into nearly half a million homes. The whole atmosphere, generally, is favorable. In connection with the Protestant work, there are about 500 churches, and 700 other preaching places. There are nearly 100 self-supporting churches, and about 400 church buildings, worth nearly 1,000,000 yen. There are nearly 60,000 church members who gave last year 150,000 yen for Christian work. There are about 450 ordained Japanese ministers and over 800 unordained Japanese workers. There are over 200 young men in theological schools and 150 women are being trained in Bible schools. There are over 800 foreign missionary workers in Japan. The Y. M. C. A. has seven foreign secretaries and as many Japanese secretaries with organizations in nine cities, and in fifty-five schools, including two universities, seven higher middle schools, seven medical schools, and twenty-five middle schools.

ADDITIONAL INFORMATION.

A Constitutional Empire (1889). Mikado (1868-). Mutsu Hito, aided by a Privy Council. Legislative power is vested in the Mikado, the Diet of a House of Peers, and a House of Representatives. The Peers number about 370, princes or prominent men, elected for life or for seven years. The Representatives number 309, elected for four years, by males over twenty-five, paying a tax of at least 10 yen.

Japan has 147,655 sq. m., with a population (1905) of 47,812,702 (310 per sq. m.). The islands of Formosa (13,500 sq. m., with 3,059,235 population), the southern part of Sakhalin and the Pescadores, also belong to Japan. Tokyo (the capital) has 1,440,121; Osaka, 821,235; Kyoto, 353,139; Yokohama, 193,762; Kobe, 215,780. In 1902 there were 84,038 Shintoist temples, 71,788 Buddhist, and 1,102 Christian churches (Roman Catholic, Greek, and Protestant). Besides there were 220,572 shrines to eminent ancestors of the Imperial House, independent of religious sect.

Revenue (1906-7, estimated), 494,709,700 yen; expenditures, 495,704,700; public debt (1906), 1,872,381,120 yen. The extraordinary expenses of the Russian war amounted to 1,982,000,000 yen. About 23,000,000 yen are to be set aside yearly to meet the war debt, which it is estimated will pay it off by 1939.

Exports (1905), 328,232,220 yen; imports, 498,715,870 yen. Chief products: Rice, tea, sugar, silk. Imports (1905) from British Empire, 221,370,000 yen; from United States, 106,460,000 yen; from China, 52,618,408 yen; exports to British Empire, 540,900,000; to U. S., 95,970,000.

Of the 45,000,000 population of Japan, 30,000,000 are farmers, or, more correctly speaking, gardeners. The Japanese farm is a garden, irrigated and fertilized and scientifically and intensively tilled.

A writer in the *Booklover's Magazine* for Aug., 1904, says: "The secret of the success of the little Daybreak Kingdom has been a mystery to many students of nations. Patriotism does not explain the riddle of its strength, neither can commerce, nor military equipment, nor manufacturing skill. Western nations will fail fully to grasp the secret of the dynamic intensity of Japan to-day, and will dangerously underestimate the formidable possibilities of the Greater Japan—the Dai Nippon—of to-morrow, until they begin to study seriously the agricultural triumphs of that empire. For Japan, more scientifically than any other nation, past or present, has perfected the art of sending the roots of its civilization enduringly into the soil."

Progressive experts of high authority throughout the Occident now admit that in all the annals of agriculture there is nothing that ever approached the scientific skill of Sunrise husbandry."

JAURES, JEAN LÉON: A French Socialist leader; born at Castres (Tarn), 1859. Graduating from a normal school, he was a professor at Albi and Toulouse. Elected to the Chamber of Deputies in 1885-89, he voted with the Moderate Republicans. Returning to his profession, he became interested in social questions and 1893 was elected for Albi, and became the leading Socialist of the Chamber, and leader of the evolutionary wing of the national Socialist movement. Defeated in the election of 1898, he became the editor of the *Petite République*. He favored the entry of Millerand into the Waldeck-Rousseau cabinet, opposing in this J. Guesde and the orthodox Socialists, but carrying the majority of French Socialists with him. His impassioned oratory and other gifts make him a natural leader, and to his influence largely is due the present union of the French Socialist Party. He was reelected in 1902 and 1906. Author of "Socialist Essays."

JEFFERSON, THOMAS: Third President of the United States; born Albemarle County, Va., 1743. Attending William and Mary College, and studying law at Williamsburg, was admitted to the bar in 1767, and soon acquired standing and wealth. From 1769 to the Revolution he served in the Virginia House of Burgesses. He soon became a leader of the opposition to the king, and in 1775 took his seat in the Continental Congress. He drafted the Declaration of Independence; 1776 resumed his seat in the Virginia Legislature, and secured the first law establishing perfect religious freedom. From 1779 for two years he was Governor of Virginia. In 1782 his wife died, and, distracted with grief, he accepted an appointment as Minister to France. Appointed by Washington Secretary of State 1789, he served till 1794, when he resigned. During this period the Democratic Party (or Republican-Democratic Party as it was first called) developed with Jefferson as leader, opposed to the Federalism of Hamilton, Jefferson's colleague in the Cabinet. In 1796 Jefferson was elected Vice-President, and in 1800 President. During his administration the public debt was reduced, Louisiana purchased for \$15,000,000, Algerian pirates conquered, and the system of precedence abolished for a reasonable etiquette. Jefferson was reelected in 1804 almost without opposition. His embargo policy retaliating upon France and England by prohibiting U. S. vessels leaving port, however, struck a blow at the navy, and opposition to him increased. In 1808 he declined to be nominated for a third term, and retired to Monticello, where he interested himself in founding the University of Virginia. Died July 4, 1826.

In social reform Jefferson is still a vital force, as the father of democracy and of decentralization in the U. S.

JENKINS, JOHN: English Labor M.P.; born 1852, Pembroke Dock, South Wales. When sixteen, apprenticed to two firms of Cardiff ship-builders, he worked his way till he became president of the Cardiff Shipbuilding Society. In 1893 he represented the Bristol Channel District in the Associated Shipwrights' Society. His interest in municipal affairs led to his election in 1890 as town councilor, and in 1903 mayor of Cardiff. When the Trade-Union Congress met at Cardiff in 1895 he presided. In 1906 he was elected to Parliament for Chatham, supported by the Labor Representative Committee. Address: Grange-town, Cardiff.

JENKS, JEREMIAH WHIPPLE: American economist; born 1856, St. Clair, Mich.; graduated University of Michigan, 1878; Ph.D. at Halle, Germany, 1885; professor of political economy and social science at Indiana University, 1889-1891; and at Cornell (his present position), 1891. Mr. Jenks has been appointed on numerous United States commissions as expert agent and special investigator; for the INDUSTRIAL COMMISSION on trusts and combinations, 1899-1901, for the U. S. Labor Department on the same, for the War Department on financial and labor conditions in the Orient, on international exchange and currency reform in China, also by the Mexican Government on currency in that country. Author "The Trust Problem," 1900, revised 1903; also reports for the above commissions, and numerous economic articles and papers. Address: Ithaca, N. Y.

JEVONS, WILLIAM STANLEY: British economist; born Liverpool, 1835; went in early life to Australia, and held the post of assayer in the Sydney mint from 1854-59; then returned to England in order to pursue his studies in philosophy and ethics; was professor of logic from 1866-1876 at Owens College, Manchester, and of economics at University College, London, from 1876-81; was drowned at Bexhill in 1882.

In the field of applied economics Jevons discussed monometallism and bimetalism, declaring himself, tho in very temperate and guarded terms, a monometallist. He favored cooperation and profit-sharing, and also believed in State legislation on social questions. (See his "The State in Relation to Labor," 1882.)

In economic theory he is best known for his conception of total utility (*q. v.*). He is the author of a "Primer of Political Economy" (1878); "Money the Mechanism of Exchange" (1879); "Principles of Science" (1874, 2 vols.); "Theory of Political Economy" (1879); "Methods of Social Reform" (1883); and "Investigations in Currency and Finance" (1884).

JEWISH COLONIES: "Back to the soil" is the latest cry of the Jews. After 1,800 years of trading, trafficking, and banking, they are awakening to the fact that they were originally an agricultural people and have been kept from the soil by adverse laws and not by their own inclinations. During this long period nearly every State forbade the Jew to hold land, and he was forced into other occupations. Gild laws and other restrictions even hindered their becoming artizans; hence largely their entry into commerce. These obstacles, however, being now largely removed, the Jew has begun to become a farmer and a mechanic—tentatively at first, but now in ever larger numbers.

The oldest Jewish colonies were located in Palestine, where several are reported to have existed as early as 1170, and one, consisting of 60 families, was definitely mentioned as located at Gaza in 1481. At the close of the sixteenth century another colony, "where only Jews were to dwell," is said to have been established near Tiberias. Other reports are indefinite and unreliable.

The first definite attempt to colonize the Jews was, strange to say, made in Russia. The historian Czacki and the poet Derzhavin prevailed upon the Emperor Paul in 1799 to take measures for settling them in agricultural colonies. He consented in order "to check the selfish occupations of the Jews." After various preparations Czar Alexander I. issued an "Enactment concerning the Jews" in 1804 to the effect that the Jews should be grouped into five classes, agriculturists, manufacturers, artizans, merchants, and minor burgesses; that the agriculturists should be permitted to buy and lease land in the western and southwestern provinces; that the government grant 81,000 acres of land to the poorer colonists; that a medical certificate of health and physical fitness should be submitted by every prospective settler; and that every family should give evidence of possessing at least 400 rubles. In 1806 a large number of Jewish families settled in different parts of the province of Kherson and established in all 9 colonies, which had to be located at a certain distance from Christian villages, and in which any occupation but farming was forbidden. Owing to adverse conditions of soil, climate, and government, the colonies did not prosper. But in 1823 General Intzov procured a grant from the Czar of 50,000 rubles for the colonies; 443 new families joined the 1,600 already settled. The military discipline was, however, not suited to the temperament of the Jews, and the colonies never prospered. A later attempt (1835) at colonization in New Russia failed, notwithstanding many privileges granted prospective settlers by the crown. In 1836 the Czar issued an order designating 40,895 acres of land near Tobolsk and Omsk in Siberia for Jewish colonies. Nine hundred families from various parts of Russia sent in their applications, and 36 of them actually arrived at Omsk, when in Jan., 1837, a counter order was issued to the effect that "the transfer of Jews to Siberia must be stopt." Seven hundred and thirty-eight families were taken into the 9 colonies at Kherson against their desire. The government expended 234,539 rubles from 1841-45 for these, and 6 new colonies; about 1,661 families, or 12,779 persons, were settled in 15 colonies; 5 synagogues, 12 houses of prayer, 6 town-halls, 7 warehouses, 7 bath-houses, 8 windmills, were built; they had all necessary farm implements and animals, but—the colonies failed owing chiefly to the interference of corrupt government officials. From 1847-60 17 new colonies were established in the province of Ekaterinoslav and 2 in Kherson. In 1865 there were in all 37 colonies, with 2,873 families and 32,943 persons cultivating nearly 249,700 acres of land. In 1864 Jews were deprived of the right to buy, or even to settle on private land. This edict was later recalled, and colonization progressed rapidly in various parts of Russia and Poland, notably with the money and under the philanthropic direction of Baron Günzburg. In 1900 there were in Russia 265 agricultural col-

onies with about 100,000 persons, working about 256,500 acres of land. There were, moreover, 10,038 persons in families scattered over the country, working over 41,310 acres. Poland has a large number of Jewish colonies and single families owning and partly cultivating in 1887 over 639,000 acres.

The Jews are now doing well in the Russian colonies; they have mastered the intricacies of farming, and have established a college where advanced teaching is given in various branches of agriculture. In order to prevent a return to commerce the colony of Rossianka, Bessarabia, requires that every storekeeper within its borders should be a Christian. If they have a number of failures standing against them, these must be attributed to the uncertainty of Russian decrees on the subject, or to the thwarting of the benevolent intentions of the emperors by the bureaucracy, and not to a Jewish repugnance to settle on the land.

Palestine is next in chronological order with Jewish colonies. Sir Moses Montefiore (*q. v.*) visited the Holy Land seven times with the intention of making arrangements for colonies of his coreligionists. In 1838 he selected thirty-five families from Safed and started them on land bought by him. An attempt to form a colony had also been made by Colonel Gawler, of the British Army, but the conditions were not favorable to that project, in 1845, after the war between Turkey and Egypt in 1839-40. A number of organizations, e. g., the Alliance Israélite Universelle of Paris, the Russian "Lovers of Zion," the Odessa Aid Society, the Zionists, the Jewish Colonization Association of London, and several individuals, chiefly Baron de Hirsch (*q. v.*) and Baron de Rothschild, were so interested in the matter and had so many applications that the subject was attacked vigorously after 1870, and since that time up to 1899 about 26 colonies have been established with approximately 5,200 people, occupying over 64,500 acres of land. They have had many privations to endure, and had to combat partly inexperience and administrative difficulties, partly an inclination of the colonists to depend on charity. Many colonies have, however, paid off their indebtedness to the various charitable societies, and are doing well. They raise the various crops of Palestine, chiefly cereals; are interested in arboriculture, horticulture, agriculture, and floriculture. A new departure is the raising of silkworms. But their chief delight is viniculture, and they are said to produce an excellent wine in some colonies, particularly in the Risbon-le-Zion near Jaffa. They have introduced modern scientific farm implements, steam-plows and mills, spacious wine cellars, etc., e. g., at Zikron Ya'akov.

The Argentine Republic has three groups of colonies, established by the Jewish Colonization Association of Paris under the auspices of Baron de Hirsch. Seventeen million acres were purchased in Aug., 1891, for \$1,300,000 in different parts of the republic. *Moiseville*, Santa Fé province, was founded 1891 on a tract of 60,000 acres, 22,500 of which were tilled and occupied by 168 families with 825 persons in 1899. The great prosperity of the colony is due chiefly to the culture of Luzerne, which yields 6 crops a year, and enables the colonists to engage in dairying. *Mauricio*, province of Buenos Ayres, comprises 62,000 acres, occupied by 211 families

with 1,045 persons; 22,000 acres were tilled in 1898; the rest was used as pasture for over 3,000 head of cattle. The financial and sanitary conditions are good. The *Clara* colonies, Entre Rios province, date from 1894. They tilled (1898) 66,656 acres out of a total of 195,545 occupied. There are 19 villages or groups with a total population of over 5,000; all of them are fairly prosperous.

Canada had 4 Jewish colonies—*Moosomin*, *Hirsch*, *Oxbow*, and *Wappella*. One of these proved a failure. *Hirsch*, Assiniboia, named after its founder, began in 1892 with 30 families. In 1900 there were 28 families occupying about 11,700 acres, all doing well. *Wappella*, Assiniboia, was established in 1894 with 20 families. They had means of their own, and received help only for the building of a school in 1898. The colonies are prospering.

The United States had a Jewish colony as early as 1837 at Wawarsing, Ulster County, N. Y., consisting of 13 families. It was abandoned in 1842. The Alliance Israélite Universelle, acting through a local committee in New York City, bought 5,000 acres of land on Sicily Island, Catapowla, near Bayou Louis, La., and settled 60 Jewish Russian families with 173 persons in 1881. They worked hard, but a flood of the Mississippi in 1882 swept away all their belongings, and the colonists scattered. That year saw the beginning of the great Russian Jewish migration to the U. S., and colonies were soon established in many states. But a large number have been abandoned.

There are a number of other colonies which have had a temporary success, but failed after one, two, or three years. The most significant thing about Jewish colonies in the U. S. is the fact that where the colonists confined themselves to farming, failure was the rule; success has been met only where industries were combined with farming.

Woodbine, N. J., is the most prosperous colony in the U. S., and deserves special mention. It has its own town organization, and all the officials are Hebrews. The settlers are farmers, artisans, and manufacturers. The weekly rest day is Saturday, but the sixteen Christians of the colony may work on that day. Only one arrest has been made since the foundation of the colony, that of a drunken tramp. A new schoolhouse, costing \$15,000, was built in 1904, for 561 pupils; an agricultural college has been established. A "Brotherhood" for the general uplift of the colony was organized which has raised \$12,000 within a few years. The village had 2,500 inhabitants in 1907, and was generally prosperous.

The success of Woodbine has greatly encouraged Jewish philanthropists in their endeavor to colonize their coreligionists. In 1904 Mr. Rich, of Milwaukee, founded *Arpin*, Wis., with thirty-three persons on the model of Woodbine. A test farm of 1,000 acres has been established at *Kings Park*, Long Island, to give the prospective colonists a preliminary training for a year, so as to avoid the mistake, made so often in the past, of sending grocers, shopkeepers, and factory hands to the land without any knowledge of farming. About \$1,000,000 has been subscribed by various societies and philanthropists in order to push the colonization, not only with zeal as in the past, but with discretion. In this endeavor to furnish prospective Jewish farmers with the

TABLE OF ATTEMPTED AND EXISTING JEWISH COLONIES IN THE U. S. SINCE 1880

| NAME | Location | Estab- lished | Aban- doned | Families | Persons | Land in acres | Capital | Founder or head | Nature |

JOHNSON, ALEXANDER: General secretary of the National Conference of Charities and Correction; associate director of the School of Philanthropy; born 1847 at Ashton-under-Lyne, Lancashire, England. He engaged in commerce until 1884, when he became secretary of the Associated Charities of Cincinnati, 1884-86, and later of the Charity Organization Society of Chicago, 1886-89, and of the State Board of Charities of Indiana, 1889-93. From 1893 to 1903 he was superintendent of Indiana School for Feeble-Minded Youth. In 1897 he was elected president of the National Conference of Charities and Correction. Mr. Johnson's views on political economy and social reform may be called those of a sympathy with the Fabian Socialists, but he is hardly prepared to accept all their program. Address: 2139 N. Pennsylvania St., Indianapolis, Ind.

JOHNSON, FRANCIS: General secretary of Independent Labor Party; born 1878 in London, where he was educated in a board school. After he had served for a time as a shop-boy in a second-hand bookstore he rose to the position of manager. Joining the Independent Labor Party, he soon became prominent in his local branch. In 1900 he entered the general office of his party, became assistant secretary in 1903, and general secretary in 1904. Address: 23 Bride Lane, Fleet Street, E. C., London, England.

JOHNSON, JOHN: Labor member of Parliament for Gateshead; born 1850; went into the pits at the age of nine; became a member of the Executive Committee, Durham Miners' Association, in 1883; treasurer in 1890, and financial secretary in 1897. Elected to Parliament in 1894; again in 1906 by the votes of the Miners' Association. Address: 20, The Avenue, Durham, England.

JOHNSON, TOM LOFTIN: Reform mayor of Cleveland, and capitalist. He was born in Georgetown, Ky., July 28, 1854; removed to Indiana in his early childhood, and received an elementary education there. After he had made some money, he bought a street-railway in Indianapolis; and when he had put the road on a paying basis, he acquired large interests in the street-railways of Cleveland, Detroit, and Brooklyn. In Cleveland, he began to manufacture iron and steel.

He was elected a member of Congress by the Democrats from 1891-95; and became a strong advocate of the "single tax" theories. At the present he is devoting all his time to economic questions, particularly to that of taxation, and to his official duties as mayor of Cleveland, having been elected to that office in 1901. He has succeeded in reducing the fare to three cents on the street-cars of his city. Address: Cleveland, Ohio.

JOHNSON, WILLIAM: Labor member of Parliament for Nuneaton, Warwickshire; born 1849; began work early in a factory, later in a mine. Has been secretary and agent of the Warwick-

shire Miners' Association since 1885; is a member of the County Council for Bedworth. Was elected to Parliament in 1906, chiefly by the votes of the Miners' Association, assisted by the Liberals. Address: Miners' Offices, Bedworth, Nuneaton, England.

JOHNSON, WILLIAM EUGENE: American journalist and Prohibitionist; born Coventry, N. Y., 1862; educated in public schools and University of Nebraska. He was writer on the *Lincoln Daily News*, and in other journalism till he became associate editor of the *New York Voice* (Prohibition) and of *The New Voice*, Chicago, 1899-1905. Was Prohibitionist nominee for Congress in Maryland, 1904; he is special agent of U. S. Interior Department, and appointed to aid in suppressing the liquor traffic in the Indian Territory and Oklahoma. Author (with John Woolley) "Temperance Progress in the Nineteenth Century" (1903), and of the "Encyclopedia of the Alcohol Problem" (in preparation). Address: Laurel, Md.

JONES, RICHARD: English economist; born Tunbridge Wells, England, 1790; graduated Cambridge 1816; was ordained to the ministry; in 1833 became professor of political economy at King's College, London, and in 1835 succeeded Malthus in the chair of political economy and history at the East India College, Haileybury. From 1836 to 1851 he occupied the position of commissioner under the Tithe Commutation Act. Died at Haileybury, Jan. 26, 1855. As an economist, Jones stands between the school of Adam Smith and the modern historical economists. He recognizes strongly the necessity of the inductive method, and opposes the deductive method of Ricardo.

JOWETT, F. W.: English Labor M.P.; born at Bradford. He worked in the textile mills there and became manufacturer's manager at twenty-eight. In 1901 Jowett devoted himself to public work, and for several years was director of the Bradford Provident Industrial Society. In 1892 he became a city councilor, and in 1895 was made an alderman. Mr. Jowett was before the constituency from 1897. He was elected to Parliament, 1906, for Bradford West, indorsed by the Labor Representative Committee. Address: 2 Grantham Place, Bradford.

JUDAISM, SOCIAL POLITY OF: All views and interpretations of the sacred books of the Hebrew race find in them the institutes of a peculiar social polity. Viewed as the product of infallible inspiration or in the light of the latest and highest criticism, the Old Testament records a social polity, whether given of God in immediate revelation or developed through long ages of national evolution, of deepest interest and most practical significance. The heart of the whole is in the national law. Says Canon Fremantle ("The World the Subject of Redemption"):

The Law was the center of the religion and theology of Israel. . . . It was not "the law of commandments contained in ordinances," but the law of righteousness, which underlays the ordinances. . . . The mere ceremonialism, apart from moral good, finds no encouragement in the Old Testament. Against that all the prophets from Hosea onward protest. The law of moral and political relations is the center of the theology of the Old Testament. . . . The theme which is more than any other upon their poets' lips is the law of Jehovah.

In the Psalms there are a few faint allusions to ceremonial

customs, such as the laws of drink offerings of blood, or of forbidden food, or the purging with hyssop; a few words about the new moon and solemn feast days; not a word about circumcision, not a word about the passover, not a word about the Sabbaths, not a word about ceremonial uncleanness. There is probably in modern hymns, eighteen centuries after Christ, more of artificial religion than in the Psalms, written in the bosom of Judaism. But, on the other hand, almost every Psalm appeals to the law of plain justice, public and private. . . . It is the moral and political law, not the ceremonial, which is enshrined in the hearts of the people.

The basis of the whole law is the recognition of Jehovah as the God of the nation, the Creator and Ruler and Owner of the earth. Land belongs to Him; His are the firstfruits; He is the God of Abraham, of Isaac, and of Jacob; His law is to be obeyed. This law is given to the organized nation, not to individuals.

National Basis

The first duty of parents to the male child of a Gentile convert was circumcision, the symbol of initiation into the national life. The Law was not given to any person in view of a personal relation to God, but only to the circumcised, or their wives and daughters, those who belonged to the organic national life. It was, thus, primarily a law of institutions. With the organized national life went the family. The first duty of the circumcised child was to obey and honor his parents (Ex. xx. 12). "Thou shalt rise up before the hoary head, and honor the face of the old man" (Lev. xix. 32). Purity and chastity were strictly inculcated. The law allowed polygamy; but he who follows the development of the Hebrew people from the obscenity and impurity, into which they are recorded as falling, through idolatrous practices, in the early years of their history, into the comparative purity and monogamy which prevailed among the Jews in the time of Christ, will realize how practically the Law aided and developed pure family life.

As in all patriarchal civilizations, the servant or slave was made a member of the household. Slavery was allowed, but it was nothing like chattel slavery; it was scarcely slavery. In Judea alone of all countries, ancient and modern,

Treatment of the Poor

the slave had rights and was not under the caprice of his master. Every Hebrew slave could go free at the end of the sixth year (Ex. xxi. 2). He was to be furnished liberally out of the flock, and out of the flour, and out of the wine-press (Deut. xv. 14). The wages of servants were to be paid every night: "The wages of him that is hired shall not abide all night until the morning" (Lev. xix. 13). Charity in all relations was inculcated: "Thou shalt love thy neighbor," said the law (Lev. xix. 18); "Thou shalt hate thine enemy" was an unauthorized addition. Justice in trade was a sacred duty (Lev. xix. 36); but the needy were particularly to be aided. "If there be among you a poor man, of one of the brethren, within any of the gates in the land which the Lord thy God giveth thee, thou shalt not harden thy heart, nor shut thine hand from thy poor brother, but thou shalt open thine hand wide unto him and shalt surely lend him sufficient for his need" (Deut. xv. 7, 8). The loan was to be without interest. "If thou lend money to any of my people that is poor by thee, thou shalt not be to him as a usurer; neither shalt thou lay upon him usury" (Ex. xxii. 25). Usury meant interest; the word is sometimes translated increase. "Thou shalt not lend upon usury to thy brother, usury of money, usury of victuals, usury of anything that is lent upon usury," said the Deuteronomic

law. This was not a moral law of universal validity. The Hebrew was allowed to take interest from a Gentile. "Unto a stranger thou mayest lend upon usury" (Deut. xxiii. 20). It was a socialist law, and one had to belong to the instituted nation to gain its benefits. Those who walked through cornfields or vineyards were to be allowed to pluck of the corn or the vine (Deut. xxiii. 25). The widow and the orphan were particularly to be cared for (Deut. x. 18).

All these enactments were made possible by the Hebrew land law. Under private property and a competitive civilization it is impossible to

Land Law lend without interest to every one that asks, or to allow trespassing on a planted field or vineyard. Under the Hebrew law it was possible, because everybody was protected in the *use* (not ownership) of a little land, and therefore those who needed to borrow or receive aid were comparatively few. God was considered the owner of all the land, and it was meted out not for ownership, but for use. "The land shall not be sold forever, for the land is mine," God is represented as saying in Lev. xxv. 23. The land was supposed to have been measured out by Joshua by the line and the lot, and a portion assigned to each family according to its size. And this ownership for use was inalienable. If any family became embarrassed and gave the land in debt, it returned on the fiftieth year—the year of jubilee—to its former owner. This was the wording of the law as given in Lev. xxv. 24–31:

And in all the land of your possession ye shall grant a redemption for the land.

If thy brother be waxen poor, and hath sold away some of his possession, and if any of his kin come to redeem it, then shall he redeem that which his brother sold.

And if the man have none to redeem it, and himself be able to redeem it;

Then let him count the years of the sale thereof, and restore the overplus unto the man to whom he sold it, that he may return unto his possession.

But if he be not able to restore it to him, then that which is sold shall remain in the hand of him that hath bought it until the year of jubilee; and in the jubilee it shall go out, and he shall return unto his possession.

There was a difference, however, with walled cities.

And if a man sell a dwelling-house in a walled city, then he may redeem it within a whole year after it is sold; within a full year may he redeem it.

And if it be not redeemed within the space of a full year, then the house that is in the walled city shall be established forever to him that bought it, throughout his generations: it shall not go out in the jubilee.

But the houses of the villages, which have no walls round about them, shall be counted as the fields of the country: they may be redeemed, and they shall go out in the jubilee.

The object of this distinction seems to have been to make agricultural life and property more secure than city life and property, in order to encourage agricultural life. But it was not only the land that the law protected for the use of all. It was a socialist law in that it protected the worker in the ownership of his tools. If he gave them in pledge they could not be kept from him overnight. Says Deut. xxiv. 10–14:

When thou dost lend thy brother anything, thou shalt not go into his house to fetch his pledge.

Thou shalt stand abroad, and the man to whom thou dost lend shall bring out the pledge abroad unto thee.

And if the man be poor, thou shalt not sleep with his pledge.

In any case thou shalt deliver him the pledge again when the sun goeth down, that he may sleep in his own raiment, and bless thee: and it shall be righteousness unto thee before the Lord thy God.

Verse 6 in the same chapter says: "No man shall take the nether or upper millstone to

pledge, for he taketh a man's life to pledge." Protected thus, both in the access to land and the use of tools, no Hebrew, as long as the law was obeyed, need be poor. Taxation was a single tax of one tenth of all produce of the soil or the flock. This prevented all extortion of financiers. The whole system of laws was connected with a ritual to connect the political law with the

Religious Sanctions

thought of God. Great religious festivals were organized in connection with the national history and with the seasons. The Levites administered the law in connection with the temple or religious gatherings. The people, in solemn assemblies, repeated the curses and blessings of the Law. The whole law of the land was connected with the religious Sabbatical feasts. One day in seven the laborer found complete rest. One year in seven the land was to go untilled; the slave was to go free; one year in seven times seven was the year of jubilee, when land reverted to the owner and every mortgage was wiped off. Religion was thus associated with relief from labor and release from debt. There was no king; those ruled who showed themselves inspired of God; the nation was organized by tribes, families, and other divisions. Such was, in brief, the Hebrew social polity. In practise it was overthrown. The Hebrew people eventually chose a king, and found slavery and captivity. Some think the law was never fulfilled; that the law we have summarized was only very gradually developed. With the history we are not here concerned. Christian socialists believe that it needed the Spirit of Christ to fulfil the law. (See CHRISTIAN SOCIALISM.) Socialists argue that the world was not yet ready for socialism. Individualists claim that it was an impossible and impractical legalism.

JUDICIARY SYSTEM UNITED STATES AND GREAT BRITAIN: (For other countries, see those countries.)

I. UNITED STATES.

The judiciary system of the U. S., on account of the size of the country and the involved relation of federal and state courts, is very much more complicated and involved than in any other, and in no other country does the judiciary play the important political part that it does in the U. S.; for in no country except the U. S. is the Supreme Court of justice also the Supreme Court of legislative judgment.

We consider (a) the Federal Courts; (b) the Supreme Court; (c) the State Courts; (d) the Mis-carriage of Justice.

a. *The Federal Courts.*—The constitution gives to federal courts jurisdiction in

1. All cases in law and equity arising under the constitution, the laws of the U. S., treaties made, or which shall be made, under their authority, and in general all cases concerning the country as a whole, ministers, and consuls.

2. Controversies between two or more states, between citizens of different states, between citizens of the same state claiming lands under grants of different states, and between a state, or the citizens thereof, and foreign states, citizens, or subjects.

The federal courts are of three kinds—the Supreme Court at Washington, circuit, and district

courts. The Supreme Court has nine judges—a chief justice (salary, \$13,000) and eight associate judges (salaries, \$12,500). They are nominated for life by the president and confirmed by the Senate, and are removable only by impeachment. Only once has a judge of the Supreme Court been impeached—Samuel Chase, of Maryland, in 1804–5, and then unsuccessfully. The Supreme Court sits from October to July of each year. Six judges must be present to pronounce a decision, and every case is discussed by the whole body twice over.

The circuit courts number nine, each with its own judges (salaries, \$7,000), and to each is allotted a judge of the Supreme Court. A Circuit Court of Appeals was established in 1801, to attempt to relieve the overtaxed Supreme Court. District courts number 91, and there has been established at Washington a special Court of Claims. All federal judges are appointed for life (subject to impeachment), as the Supreme judges, tho the constitution does not state that this should be so. The jurisdiction of the Supreme Court in cases affecting ambassadors, and where a state is a party, is original; in all other cases it is appellate.

The criminal jurisdiction of the federal courts, which extends to all offenses against federal law, is purely statutory. "The U. S. as

Jurisdiction such can have no common law. It derives its powers from the grant of the people made by the constitution, and they are all to be found in the written law, and not elsewhere" (Cooley's "Principles," p. 131).

Each federal court has attached to it a U. S. marshal, to carry out its decisions, and he can call on good citizens for help, and, if necessary, apply to Washington to obtain the aid of the federal troops.

On the somewhat complicated point as to the relation of federal and state law, Mr. Bryce says ("The American Commonwealth," 1st ed. pp. 247, 248):

The U. S. is a federation of commonwealths, each of which has its own constitution and laws. The federal constitution not only gives certain powers to Congress, as the national legislature, but recognizes certain powers in the states, in virtue whereof their respective peoples have enacted fundamental state laws (the state constitutions) and have enabled their respective legislatures to pass state statutes. However, as the nation takes precedence of the states, the federal constitution, which is the supreme law of the land everywhere, and the statutes duly made by Congress under it, are preferred to all state constitutions and statutes; and if any conflict arise between them, the latter must give way. The same phenomenon therefore occurs as in the case of an inconsistency between the constitution and a congressional statute. Where it is shown that a state constitution or statute infringes either the federal constitution or a federal (i. e., congressional) statute, the state constitution or statute must be held and declared invalid. And this declaration must, of course, proceed from the courts, not solely from the federal courts; because when a state court decides against its own statutes or constitution in favor of a federal law, its decision is final.

b. The Supreme Court.—The constitution of the U. S. is above the power of Congress to change. It was ratified and made binding not by Congress, but by the people, and can be amended only by the people in appointed ways—a most difficult and slow process. Congress can therefore legislate only subject to the limits the constitution sets. The tenth amendment to the constitution, adopted in 1791, distinctly says: "The powers not delegated to the U. S. by the constitution nor prohibited by it to the states are reserved to the states respectively or to the people."

The body that finally decides what is constitu-

tional is the Supreme Court. Any law that the Supreme Court decides unconstitutional is illegal. This gives the Supreme Court enormous power. After long debate Congress passed an income tax (*q. v.*), and there is no question that such a tax was desired by a large majority of the people; but the Supreme Court decided by one vote that the bill was unconstitutional, and the bill did not become law. In such a case a single corrupt judge could subvert the will of the whole people save as by slow process the constitution is amended. This to an extent makes the judiciary supreme over Congress and the executive, and (except by the slow process of constitutional amendment) to a degree supreme over the people. It is true that the Supreme Court does not formally act on legislative bills—its power is only one of interpretation. It simply decides the individual case brought before it according to the law, and where laws conflict, according to the highest law, that is the constitution; but this practically enables it to pass upon any bill enacted by Congress. And this power of interpretation is the greater for two reasons: (1) That a wrong decision is not easily reversed. In England, if

Dangerous Powers

the courts find that a law means what the people do not desire, the law can easily be amended. In the U. S. a wrong interpretation of the constitution is most difficult to reverse. (2) The constitution, being of necessity brief, the opportunity for interpretation is very broad. Hence in practice the Supreme Court has enormous power. It is true that this power has not been frequently corruptly used. The Supreme Court has not by many been considered venal or even unfair; but the trouble is that the people often have more to fear from just decisions than unjust. A decision flagrantly unjust or venal could be more easily reversed; but a just decision that the constitution does not allow of a certain measure is difficult to reverse, even tho the whole people desire it. Yet, to Democrats, at least, what the large majority desire ought to be legal. Legislation ought to belong in usufruct to the living. A free people ought not to be fettered by a constitution enacted a century ago under conditions utterly different from the present. Yet if the Supreme Court decides a bill unconstitutional, it cannot hold, no matter what the people will, save by slow process of amendment; and the more honest the judges are the more difficult to change the decision. In cases where a U. S. official, like the president, deems that the Supreme Court has made a mistake in the interpretation of the constitution, it has been claimed that he must follow the best judgment he has and disobey the Supreme Court, since, in his judgment, to obey the court would violate the constitution he is first of all bound to obey. President Jackson attacked the U. S. Bank as illegal, tho the Supreme Court had decided it legal. Jefferson denounced a judgment of Chief Justice Marshall. Majorities in Congress have claimed the same right; but recently both executive and legislative have receded from claiming this right, and certainly in case of a just decision it would be impossible to disobey it on this ground.

The constitution does not limit the number of supreme judges, and some claim that the will of the people could be realized by appointing judges who would decide that the will of the people was constitutional; but such a procedure would be looked upon as revolutionary by many, if not by

most. The seriousness of this feature of the constitution cannot, therefore, be easily exaggerated. It is true that thus far no great evils have seemed to arise. John Fiske says of the Supreme Court ("Civil Government in the U. S." p. 252):

It is peculiarly American, and for its exalted character and priceless services it is an institution of which Americans may well be proud.

Mr. Bryce says ("The American Commonwealth," 1st ed., pp. 406, 407):

The rigid constitution of the U. S. has rendered and renders inestimable service. It opposes obstacles to rash and hasty changes. It secures time for deliberation. . . . It forms the mind and temper of the people. . . . It trains them to habits of legality. . . . It familiarizes them with, it attaches them by ties of pride and reverence to, those fundamental truths on which the constitution is based.

And again (p. 271):

The credit and dignity of the Supreme Court stand very high. No one of its members has ever been suspected of corruption, and comparatively few have allowed their political sympathies to disturb their official judgment.

But in spite of this favorable view two things must be remembered: (1) that the longer the country moves from the conditions when the constitution was framed, the more must its requirements fetter and be unsuited to the needs and wishes of the people; (2) the more political questions turn upon industrial and financial questions, the more likely is the Supreme Court to be out of touch with the masses of the country. Almost of necessity the supreme judges come from the class of the most educated, the most successful, the most wealthy; this must be so almost inevitably from the nature of the case; almost inevitably, therefore, with the best of will, they must judge from their environment, their education, their experience. Whether they will understand the common people is, therefore, especially in industrial matters, at least questionable. With-

Unnecessary out, then, reflection upon the purity of the Supreme Court, its power under the constitution is open to the gravest question. It is not necessary. In England it is not so. In England, Magna Charta, the Bill of Rights, the Act of Settlement, the Acts of Union with Scotland and Ireland are merely ordinary laws which can be repealed by Parliament at any moment. There is no constitution superior to the legislature. All laws are made by the legislature and all can be repealed by it; nor is the institution necessary even to a republic.

Says Mr. Bryce ("The American Commonwealth," pp. 259, 260):

The case of Switzerland shows that the American plan is not the only one possible to a federation. The Swiss Federal Court, while instituted in imitation of the American, is not the only authority competent to determine whether a canonical law is void because inconsistent with the federal constitution, for in some cases recourse must be had not to the court but to the Federal Council, which is a sort of executive cabinet of the confederation. And the Federal Court is bound to enforce every law passed by the federal legislature, even if it violate the constitution. In other words, the Swiss constitution has reserved some points of canonical law for an authority not judicial, but political, and has made the federal legislature the sole judge of its own powers, the authorized interpreter of the constitution, and an interpreter not likely to proceed on purely legal grounds.

Some radicals believe that the cure for America lies in one constitutional amendment giving to Congress the power of action, within certain limits, without reference to the constitution. A large number find the cure in the adoption of the referendum (q. v.).

c. State Judiciary.—The judiciary in every state includes three sets of courts: A supreme court or court of appeals; superior courts of record; local courts; but the particular names and relations of these several tribunals and the arrangements for criminal business vary greatly from state to state. There are courts of common pleas, probate courts, surrogate courts, prerogative courts, courts of oyer and terminer, orphans' courts, courts of general sessions of the peace and jail delivery, quarter sessions, hustings' courts, county courts, etc.

The jurisdiction of state courts is complete. There is no appeal to federal courts except on matters pertaining to federal law. Each state recognizes the judgments of the courts of a sister state, gives credit to its public acts and records, and delivers up to its justice any fugitive from its jurisdiction charged with a crime. Of course the courts of one state are not bound either by law or usage to follow the reported decisions of those of another state. They use such decisions merely for their own enlightenment, and as some evidence of the common law, just as they use the English law reports. Each state makes its own law, and these laws vary enormously not only between states, but also from time to time.

Concerning the purity of the state judiciary, Mr. Bryce says ("The American Commonwealth," p. 507):

Any one of the three phenomena I have described—popular elections, short terms, and small salaries—would be sufficient to lower the character of the judiciary. Popular elections throw the choice into the hands of political parties—that is to say, of knots of wirepullers, inclined to use every office as a means of rewarding political services, and garrisoning with grateful partisans posts which may conceivably become of political importance. Short terms . . . oblige the judge to remember and keep on good terms with those who have made him what he is, and in whose hands his fortunes lie. . . . Small salaries prevent able men from offering themselves for places whose incomes are perhaps only one tenth of what a leading barrister can make by private practise. . . . The mischief is serious, but I must own that it is smaller than a European observer is prepared to expect.

The reasons given for this lack of the worst results Mr. Bryce considers the presence in every state of federal tribunals, the power of public opinion, and lastly the power of the professional influence of the bar. Nevertheless, great scandals have arisen. (See CORRUPTION.)

Lawyers in the U. S., differently from those in Europe, are allowed to plead in any court they will. Almost absolute liberty is given. The result is an intense competition, and not unfrequently a low tone for the profession.

This freedom allows of great injustice to the poor. Judgments are often pronounced, not upon absolute equity, but upon whether the accused has in court been proven to have violated a law. Especially where the laws are as involved as in the U. S., a shrewd lawyer, unless opposed by one equally shrewd, can find some loophole in the law for almost any client, at least in civil practise. A wealthy corporation can afford to employ the shrewdest counsel. The poor usually cannot. Therefore the poor are usually in such cases helpless. Of the injustice of this to the poor we speak in the next section. Of its effect upon the lawyers we speak now. It means that in most cases success for the lawyer lies in shrewdly defending or serving the interests of the great corporations, as the railroads, etc.

To do this requires of necessity no actual dishonesty, but simply the development of ability

**Corporation
Lawyers**

to see shrewd ways of avoiding or using the requirements of law. The average successful lawyer is the corporation lawyer. He becomes accustomed to viewing things not from the standpoint of equity, but of shrewd interpretation in favor of his corporation. This is what he is paid to do. Involving at first at least no absolute dishonesty, it leads too often to a blunting of the moral sense. Even where this does not result, by his interests, his ambitions, his associations, his professional instinct, above all, his social environment, he becomes honestly the partizan of the corporation. He goes into the legislature and finds there abundant opportunity to serve his former clients, and by his training is led even unconsciously to do so. The financial prizes in this line are very large. Corporation lawyers, in what is considered perfectly legitimate practise, can make as much as \$100,000 a year, while \$50,000 is not infrequent. With 114,000 lawyers in the U. S., in 1900 competing for these prizes, many of them poor, the temptation to rise by serving the interests of wealth becomes well-nigh irresistible. A very few succeed by championing the cause of labor, but usually they lose professional and social caste, so that many who for political reasons might choose the side of the poor are deterred by family and social claims. Under these circumstances, without the necessity of implying any unusual corruption on the part of the lawyers, the people are, and especially the labor people, not without reason, growing suspicious of corporation attorneys, and particularly of their presence in legislatures, where, however, they form the large majority in the House of Representatives.

d. *The Miscarriage of Justice.*—The miscarriage of justice in modern courts is not mainly due to unjust judges or corrupt lawyers, but to the present judicial system. Professor Ely writes in the *Christian Advocate*:

Perhaps no current phrase is more frequently heard than that all men are equal before the law. It belongs to a class of phrases which cover facts and prevent thought. Nothing could be farther from the truth, for it is possible to mention at least six respects in which legal inequality exists to-day in the U. S.

1. All men are supposed to be familiar with the law, and ignorance of the law excuses no one. How, then, can we talk about the equality of the law, when the law is so complicated, and only few can know it? In addition to the comparatively few who can know it, there are a few wealthy individuals and corporations who can employ well-trained experts in the law to inform them of the law in so far as it is important for them to know it. Compare the situation in this respect of a great railway corporation and a labor organization with which it may be engaged in conflict. It is not at all unlikely that some of the officers of the corporation may themselves be trained lawyers, receiving salaries of from \$5,000 to \$25,000, and in addition to this the corporation is certain to have in its constant employment attorneys receiving high salaries, and who give advice upon every step taken. The counselors of the corporation are familiar with every twist and turn of the law, and know the purport of conflicting judicial decisions,

so hard for the ordinary man to understand. The highest salary ever received by an officer of a labor organization was \$5,000, and it is believed that at the present time no one receives over \$3,000. No labor organization can keep in its constant employ able attorneys, for, on the one hand, it cannot pay sufficiently high salaries to secure the best talent, and, on the other, the position of attorney for working men is not calculated to lead to further advancement.

2. The law affords very unequal protection to the rich and to the poor. The avenues of justice are in one way and another closed to the poor and ignorant. If ignorance itself of the proper methods of securing redress is not a sufficient barrier, fees of one kind and another and heavy court charges deter the poorer members of the community from seeking justice at law. When poor people have a case in the courts to protect them against their employers, or others with larger economic resources, the case may be delayed from time to time, may be appealed from one court to another, and it may be transferred from one jurisdiction to another. Railway

corporations engaged in interstate commerce like to transfer cases to the U. S. courts, and thus they can put their antagonists to the expense of long journeys. These are some of the ways by means of which the resources of the poorer party can be exhausted and justice defeated. Often the poor man does not know how to take the first step to secure justice, and when he takes the first step it often happens that he is exhausted before he can take the last one.

The secretary of the Chicago Bureau of Justice, to which reference has already been made, in his second annual report speaks about the inaccessibility of the means of legal redress for wage-earners, and generally for the poorer members of the community. He says that it is necessary that the fee system should be abolished, both in so far as it relates to justices of the peace and to constables.

3. We must consider the inequality of the law itself. The law in the U. S. is not so framed expressly that an offense committed by an employer or a rich man receives one kind of punishment, and the offense committed by an employee or a poor man receives a different kind of punishment, but the penalties are so framed that they bear with unequal severity upon the various social classes, and thus offenses apt to be committed by the rich are not likely to be visited by such heavy penalties as those to which the poorer people are specially liable.

I am glad to be able to quote so good an authority, a man so highly esteemed, as the late Josiah Quincy, who in his "Figures of the Past" thus describes one kind of legal inequality: "It is no disrespect to the majesty of the law to maintain that it has not yet sloughed off all its barbarisms. So long as a punishment of a money fine is accepted from the rich, and the alternative imprisonment is exacted from the poor, the equality of all men before the law is but a sounding phrase."

4. We have under the next heading to notice the unequal administration of even equal law. The devices which are open to those who can employ the best legal counsel for escaping the penalties of the law on the one hand, and for bringing them to bear heavily on opponents on the other hand, are well known to all. Again, I am glad to be able to make a quotation, in order to have additional confirmation of my position, altho I think no honest and well-informed man will attempt to dispute it. It excited no surprise a few years ago when Mr.

Walling, ex-Superintendent of Police of New York City, said, "Altho, of course, all things are possible, yet I would not count as among probable contingencies under the present system of government in New York the hanging of any one of its millionaires, no matter how unprovoked or premeditated the murder he might have committed."

Many examples of unequal administration of the law can be given—in fact, so many that it seems almost absurd to mention any concrete cases. Nevertheless, I will give one or two illustrations in order to direct the thought of my readers, and to lead to further observation on their part. Railways are again instructive. A few years ago a terrible accident occurred in Massachusetts. The railway directors had disregarded the express recommendations of the railway commissioners of Massachusetts to test the safety of the bridge properly. There were no automatic brakes, and there were not so many brakemen as the law requires. A prominent paper of New York of high standing said that the case was clearly one of a preventable accident, and that it was deemed in law criminal negligence. The writer of the editorial stated that the parties responsible could be indicted and punished, and suggested that an example of punishment would teach railway managers a useful lesson. Is it necessary to tell my readers that no attempt was made to enforce the law? Every reader knows it before I state it, and he knows, furthermore, that the law in such cases is not likely to be enforced. Suppose, on the other hand, that the leaders of a great labor organization, in their desire to raise wages, or for any pecuniary reasons, should take a course resulting in loss of life, is there one of my readers who does not know that the law would lay a very heavy hand on these labor leaders? It happened not long ago that certain directors of a great corporation were indicted for an accident which resulted in a horrible death of passengers. How tenderly and considerately they were treated when they were brought before the court was described by the daily press, and the bail was fixt at \$5,000, a mere nothing for men of vast wealth. About the same time a labor leader was indicted in New York for conspiracy and extortion. This leader was at the time in Pennsylvania, and bail was at first altogether refused, and finally was fixt at \$20,000, an enormous sum for such a person, probably more than he and a half dozen of his best friends together were worth.

Taxation reveals another kind of unequal administration. The property of the rich is rarely assessed at so high a relative rate as the property of the poor.

5. A fifth kind of legal inequality is seen in the failure to provide laws needed by the masses when contrasted with the readiness to provide laws needed by the few rich, especially powerful corporations.

6. The last kind of legal inequality relates to the use of more or less corrupt means for defeating the ends of justice. These means, which of course should not exist at all, are

Expense of Litigation

accessible only to the few. Jury-bribing is one, but that is coarse and clumsy. There are many more refined processes. A friend of mine was employed in a large law office which was concerned especially with railway cases. He tells me that the lawyers in this office secure a list of all names on the jury list in all places along the line of the railway for which they are attorneys. They found out before cases were tried the personal opinions in regard to railways of every single man who could be drawn for jury service, and they challenged the names of those who were regarded as unfriendly to railways. He said that it thus becomes impossible for any one to recover damages. I will mention only two other devices under this head. One is through influence with the appointing power to secure the appointment of judges friendly to railway interests where judges are appointed, and through influence with politicians to secure the nomination of judges by both parties favorable to these same interests.

II. GREAT BRITAIN.

The judicial system of Great Britain and Ireland is much more simple. In England and Wales the principal courts with criminal jurisdiction are the High Court of Justice, the courts of oyer and terminer and jail delivery (assizes), the general or quarter sessions, the petty sessions courts, and the Central Criminal Court. Two or more justices of the peace, sitting with a metropolitan or borough police magistrate or other stipendiary magistrate, constitute a petty sessions court. Two justices constitute a court of "quarter sessions," meeting quarterly in "general sessions" at other times. Assize courts also meet quarterly in appointed towns, held by a commissioner, nominated by the crown, usually from the King's Bench Division of the High Court of Justice, but sometimes merely a king's counsel. The Central Criminal is for the city of London. The petty sessions deal with minor offenses, and greater offenses are usually investigated by them and then tried in sessions or assizes. At least twelve and not over twenty-three citizens of the district form a grand jury, and if they find a true bill, the case is tried before a judge and petty jury of twelve, from which there is ordinarily no appeal. If declared innocent the accused cannot be tried again on the charge; if convicted on questions of law (not of fact), the judge may reserve the case for the Court of Crown Cases Reserved.

In Scotland borough magistrates and justices of the peace try minor cases; county sheriffs are the criminal judges, and if they try cases with a jury there can be no appeal. The supreme court is the High Court of Justice, and consists of all the judges of the Court of Sessions. One judge can and usually does try most cases.

In Ireland the system is not essentially different from that of England and Wales. (For other countries, see those countries.)

JURY, TRIAL BY: A "petit" jury is a body of twelve men selected and sworn to determine the facts as to a suit or an indictment and to find their verdict according to the evidence presented to them. A "grand" jury is one of not less than twelve or more than twenty-three, of whom twelve must agree, to decide whether there is a sufficient reasonable probability that a person has committed an offense to justify presenting or holding him for trial before a petit jury. The grand jury still has generally the right to some extent to inquire into criminal offenses of its own motion.

The jury, as known in England and America, is the descendant of the Frankish and Norman use of the inquisition, i. e., the practise of ascertaining facts by summoning together by public authority a number of men most likely and most competent, as living in the place where the facts

occurred, to know and tell the truth. By a slow, but logical, process of development, it is now established that the jury must base their verdict only on the evidence submitted to them. The judges have now adequate power to set aside verdicts which they consider contrary to the evidence or to the instructions given by the court as to the law, and to reduce damages. It is clearly established that the jury are to deal only with the facts, and that all matters of law are to be left to the judge in civil cases, and so almost everywhere in criminal cases. Almost everywhere, provision is made for waiver of jury trial by consent and for sending to masters or auditors cases which appear to be too long or complex for the jury, even tho the parties may still insist upon a retrial before a jury. Great pains are taken everywhere to secure impartial juries. The parties in civil cases, and the accused in criminal, have ample opportunity to object to jurors for cause and to some extent without assigning cause.

There is now, as there always has been, some complaint of the jury system, but nothing more satisfactory has yet been developed. In criminal cases, many men who might be competent are disqualified because they have, or think they have, formed an opinion on newspaper reports. Men of intelligence and otherwise good character are rarely willing to do their share of the public duty by serving on juries, while others not fit for those duties are eager to undertake them, attracted by the pay, generally more than that of an unskilled laborer. That this is nothing new may be seen from the recital in the statute of 13 Edward I., 38, in 1285, of the practise of putting on diseased, decrepit and poor men, and sparing the rich. The abolition of the requirement of uniformity in verdicts is often and frequently urged.

For a thorough and interesting account of the development of the modern English and American jury and of the consequent formation of a great body of law as to evidence, see "A Preliminary Treatise on Evidence," by James B. Thayer, professor at the Harvard Law School.

ROBERT H. GARDINER.

JUSTI, HERMAN: Commissioner of Illinois Coal Operators' Association; born Louisville, Ky., 1851; attended public schools until fifteenth year; first worked for Louisville Board of Trade as messenger and statistician; at nineteen worked in the iron and hardware business of W. B. Belknap & Co., and in 1875 was admitted to a partnership in the firm, from which he retired in the spring of 1882 and went abroad. Returning to the United States, settled in Nashville, Tenn., and became in turn merchant, trust officer, bank president, until 1898, when he moved to Illinois and engaged in the coal-mining industry. Here he conceived the idea of settling disputes with labor through a commission selected by the employers and in 1900 became the first Commissioner of the Illinois Coal Operators' Association, which position he still holds. He is a member of the American Economic Association and the American Society of Social Science. Mr. Justi maintains that the relations existing between capital and labor should be purely business relations and that the methods employed to avoid and settle labor disputes should be business methods. He opposes the incorporation of labor organizations, but believes that labor organizations should put in trust with some responsible trustee a sufficient fund to compensate individual employers where loss has resulted

to them because of failure to carry out contracts. He has written many papers, and makes many addresses on labor questions, among which are: "Conciliation and Arbitration in the Coal Mining Industry"; "The Organization of Capital"; "The Open Shop versus the Closed Shop"; "Labor Problem in the South." Address: Fisher Building, Chicago, Ill.

JUVENILE COURTS: Courts where offenders under sixteen or eighteen are heard before a special judge appointed for that purpose. The objects of the juvenile courts are: (1) to keep young offenders from the ordinary courts with their hardened criminals and loafers; (2) to enable the judge to pay particular attention to each case—an impossibility in ordinary courts with their volume of business; (3) to make investigations about an offender beforehand, so as to know his or her antecedents; (4) to make punishment educational rather than punitive; (5) to sentence for indeterminate periods, so as to put the offenders on their good behavior, and thus to evoke every spark of honor and manliness in their hearts.

A corollary of the preceding principles is the sentencing of youthful offenders to industrial schools and reformatories, rather than to jails, in order to avoid the contact with hardened offenders. It is generally considered, too, that parents, guardians, and employers should be held to a certain extent responsible for the waywardness of their wards, and they are accordingly often reprimanded, fined, and placed on good behavior. Judge Lindsey (*q. v.*), of Denver, who has had great success with these courts, had a law passed as to contributory delinquency of parents, employers, and adults, in order to emphasize their joint responsibility and accountability before the law.

A judge in a juvenile court has a large amount of power, because sentence to jail, to an industrial school, or suspension in charge of a probation officer, are left to his discretion. He must consequently be a man of exceptional qualities, understanding child nature and having sufficient patience and acumen to make a thorough investigation of every case. If a judge has to hear too many cases, the very object for which juvenile courts were created is defeated. If this institution is to do its beneficial work properly, the judges should be chosen for their special fitness—not for political service—they should not be burdened with too many cases, and, finally, they

should be men of absolute probity and integrity. In the hands of a mere "machine man" this court would become an additional danger, owing to the large discretionary powers the law puts into the magistrate's hand.

The necessity for these courts may be seen from the following figures. In 1901 the 65 reformatories in the United States had an average attendance of 19,410; since their establishment, about 1830, these institutions have harbored 210,000 children. Judge Lindsey found that Denver alone had sent 2,136 boys and girls to jail from 1896-1901 for terms varying from 3 to 30 days; and that about 5,000 of them were sentenced yearly in the U. S. He has heard about 2,000 cases from 1901-5; and Judge Mack, of Chicago, is hearing about 4,000 in a year. Over 37 cities and 22 states in the union have introduced these courts; and in many cities, and nearly all the remaining states, bills for that purpose are pending. Canada, England, Australia, and other states have followed this example.

The beneficial effect from a purely economical point of view may be inferred from the fact that Colorado is said to have saved about \$270,000 during four years of Judge Lindsey's tenure of the magistrate's bench. The saving in other respects is, of course, outside the realm of figures. But the fact that the state now assumes the guardianship of the children for the purpose of assisting them to a normal and healthy maturity, and having these courts sit as chanceries rather than courts of law, has undoubtedly saved many youthful offenders from a career of crime.

Massachusetts was the first state to introduce juvenile courts in 1898; Chicago followed, 1899; Denver in 1901; the institution has since been introduced all over the country. (See also PROBATION AND PROBATION OFFICERS; LINDSEY, BEN B.)

JYSZKIEWICZ, COUNT, VLADISLAV YU-ZEFOVICH: Russian representative from Warsaw (Autonomist); born 1865. He is a large landowner, and a graduate of St. Petersburg Law School. He began public service in the Ministry of Justice, and was at one time a judge in Riga. He is one of the prominent members of the Society for the Encouragement of Industry and Commerce, also a champion of the rights of the Polish people.

K

KANSAS CITY: Kansas City, owing its rapid growth mainly to its being the second railroad center in the United States and the main distributing point for the area west of the Missouri River, is perhaps more purely a commercial city than any in the U. S. It stands only ninth among American cities in manufacturing, but second as a railroad center, in meat-packing, in milling, and first as a market for agricultural implements and for lumber. It has also been called "the most American of cities," because it attracted a comparatively small number of foreigners and has been built up on "American" lines. It is in this light of somewhat special sociological interest.

It is interesting, therefore, to note that among American cities it has been somewhat notably free from large "graft," partly due to the fact that its poorer class of citizens have been less ignorant than in most large cities, partly that its richer corporations have had not so much local as sectional interests, and not a little due to the fact that prominent citizens, largely led by the independent paper, *The Star*, early undertook for business reasons to make Kansas City a good city to live in, knowing that otherwise the city could not meet the formidable competition of other cities, since its importance was in its railroad connections, and not in its local activities. It

has been noted as having produced a political boss who has been honest. It is also a fact that the intelligence of all classes of citizens has led them to take an unusually informed interest in civic affairs. Its adopted constitutions have, as a result, been unusually progressive. Its charter of 1875, replacing the original charter of 1853, is thought to be the first "home-made" charter in the U. S., being drafted and presented to the legislature by a committee of thirteen citizens chosen at a mass-meeting. In 1889, however, it was changed, the city

Charters

meanwhile having grown from 50,000 to 100,000 on lines progressive for the time, tho the boards of public works and of the police, which had the power of licensing and controlling the saloons, were created by the state, while the schools and libraries were also under state law. It was said that the city did not rule the police, but the police the city. There was alliance with the saloon element and corruption at elections and in other ways, tho no large graft. Therefore a new charter was drafted in 1904, but defeated in the legislature in 1905 by the police and saloon element. Nevertheless, the discussion of this charter, which was very near to the ideals of the National Municipal League, prepared the way for the adoption of the Galveston idea (*q. v.*) of municipal government, which Kansas City is considering. This civic spirit has been largely led by the Civic League, established in 1901.

In other ways the city has been progressive. It expends a larger proportion of its revenue than most cities on good public schools; it has a fine library, city water-works, and other progressive features. The "Kansas City spirit," however, is largely commercial, resulting in the city's having a banking business with resources of over \$100,000,000, and large modern business buildings and hotels, side by side with those very primitive and small. It has many fine residences, with a large number of homes of families of moderate means and very few under conditions of overcrowding and poverty. The Bethel Home Settlement, the Institutional Church, an efficient charity organization society, with other agencies of this nature, work among the poor. Sunday closing has been enforced in the saloons, tho, as shown above, and as seems almost inevitable in a railroad and commercial center, with an unusual proportion of a transient population, the saloon and social evils have no little power.

Among the more important reform organizations are the:

- Anti-Saloon League, 506 Kansas City Life Building.
- Associated Charities, 1115 Charlotte Street.
- Civic League, 20 Water-works Building.
- Labor Headquarters, 1112 Locust Street.
- Salvation Army, 1300 Walnut Street.
- Socialist Headquarters, 1400 Grand Avenue.
- Woman's Christian Temperance Union, 6904 Washington Park Boulevard.
- Young Men's Christian Association, 810 Wyandotte Street.
- Young Women's Christian Association, 1024 Bart Avenue.

KARYEYEV, NICHOLAS IVANOVICH: Russian historian; representative of St. Petersburg in the First and Second Doumas; born in 1850 at Moscow, where he visited the Gymnasium and later the university, graduating in philology. He taught history in one of the gymnasia of Moscow; became professor in the university, 1878-79; in Warsaw, 1879-84; and St. Petersburg, 1885-1901, and is now professor at the Women's High School in that city—an imperial institution of high rank. He is also the editor of the Russian *Historical*

Review, and has not always defended the crown, as his imprisonment testifies. Nevertheless, he is a member of the St. Petersburg Municipal Council, and represented that city in the Douma. He is a Constitutional Democrat and author of several historical works.

KAUFMANN, MORITZ: Author; born in Germany, he early went to Ireland, and graduated at Trinity College, Dublin, and was lecturer there 1899-1900. Entering the Church of England, he became rector of Ingworth and vicar of Calthorpe. He has been a lifelong student of socialism, and has written numberless magazine articles and accounts of socialism, with several books, such as "Socialism: its Nature, its Dangers, and its Remedies Considered"; "Utopias from Sir Thomas Moore to Karl Marx"; "Christian Socialism"; "Charles Kingsley, Christian Socialist and Social Reformer"; "Socialism and Modern Thought." Address: Ingworth, Norwich, England.

KAUTSKY, KARL: Socialist; born in 1854; editor of *Die Neue Zeitung*, the leading German Socialist review, and also, with E. Bernstein, of *Die Geschichte der Sozialismus*. He has been a voluminous writer. Among his books are: "Thomas Moore und seine Utopie"; "Der Arbeiterschutz, besonders der internationale Arbeiterschutz"; "Gesetzgebung und der Achtstundentag"; "Die Klassengesetze von 1789"; "Karl Marx, Oekonomische Lehren, Das Erfurter Programm in seinem grundsätzlichen Theil"; "Der Parlamentarismus, die Volksgesetzgebung und die Sozialdemokratie."

KAWEAH was a cooperative colony located in Tulare County, Cal. In 1884 a number of Californians decided to form a cooperative colony, and in 1885 filed their claims, forty-five in number, to some government land near the Kaweah River, under the Timber Act of June 3, 1878. Commissioner Sparks, however, ordered a suspension of their claims on the ground that he doubted if they were bona-fide settlers.

The colonists, conscious that they were bona-fide settlers and had acted legally every way, believed that in due time their claim must be acknowledged, refused to spend any money in Washington to push it, and went ahead, opening up the land and building a road eighteen miles long through land the timber companies had considered inaccessible. By 1890 they were prepared to haul lumber for the market. Their claims, meanwhile, dragged along uncompleted. The colony was organized on a cooperative plan in 1886. Shares were \$500, one fifth of which had to be paid before residence was allowed. A socialistic paper was published. All went reasonably well till 1890. Then, at least as the colonists believe, the timber companies of California, fearing their competition, plotted their overthrow. A bill was hurried through Congress on the last day of its session, Oct. 1, 1890, reserving land for the Yosemite National Park, and including in it the land the colonists had taken up. Stories were circulated that the colonists were cutting down the big trees of the Yosemite, which, tho near the colony, the colonists had not touched, and offered to guarantee not to touch. The colonists claimed that they had legally entered their claims, that judgment on them had been suspended only to be sure that they were bona-fide settlers, and that since this was the case, they could not be dispo-

sest except by eminent domain, with compensation. They were, however, dispossessed. The trustees were accused of illegally cutting down five trees which the colonists argued they had done legally. The papers where the trial took place were filled with editorials against the socialistic leaders, and they were condemned to pay \$300 each for cutting down five trees. Appeal was taken.

On Feb. 25, 1891, Lewis A. Groff, Land Commissioner at Washington, submitted to Secretary of the Interior Noble a full and elaborate report concerning the title of the colonists to their lands, in which the commissioner maintains that the colonists had faithfully complied with every requirement of the land laws, and shows that the General Land Office was possess of no legal reason why their patents should not be at once issued.

But, in spite of this report, Secretary Noble rendered a decision in which he ordered the colonists' entries to be canceled, on the ground that their titles were not *perfected*, that "Congress, in the exercise of its authority, has made other and final disposition of the lands."

The colony, already financially hurt, was broken up by this decision.

See Hinds's "American Communities."

KELLEY, MRS. FLORENCE: General secretary National Consumers' League; born in 1859 at Philadelphia, Pa.; graduated from Cornell University 1882; studied at Zurich, Switzerland, and at Heidelberg, 1883-86. Member of the bar of Illinois; Chief State Inspector of Factories for the State of Illinois, 1893-97. Associate editor of *Charities*. She is author of the following: "Some Ethical Gains Through Legislation"; "Reports of the Illinois State Department of Factory Inspection, 1893-96"; "Reports of the National Consumers' League." Address: Consumers' League, 105 E. 22d Street, New York.

KELLEY, G. D.: English Labor M.P.; born at Ruskington. Learned lithographic printing with a firm in the city of York. When the Amalgamated Society of Lithographic Printers was founded he became its secretary. He is also secretary of several trades councils, was president of International Association of Lithographers' Congress at Milan, 1904, and for six years one of Manchester's city councilors. Kelley was elected to Parliament for Manchester, S. W., in 1906. Indorsed by the Labor Representative Committee. Address: 63 Upper Brook Street, Manchester.

KETTELER, WILHELM EMANUEL, FREIHERR VON: Bishop of the Roman Catholic Church; born at Munster, 1811; was educated there, and under the Jesuits at Brug, and at the universities of Göttingen, Heidelberg, and München; entered the public service as "Referendar," 1834-38, but siding with the Church against the State, he studied under Döllinger, and was ordained priest in 1844. Located at Mayence, was very popular and untiring in his work, especially during an epidemic, and was elected to the Germanic Parliament at Frankfurt. In 1848 he preached at Mainz on social subjects to five or six thousand people, and in 1850 was made Bishop of Mainz. Untiring in his devotion to his people, he started various church associations for working men, and is considered the founder of the Catholic Socialism of Germany, a movement which, tho of

some size and political influence, is, however, quite different from English Christian Socialism.

Acquainted with, and perhaps influenced by, Lassalle, von Ketteler's ideas were in many points radically socialistic, tho always from a Church standpoint, conceiving of all social reforms as to be carried out under the patronage of the Church. Bishop von Ketteler's main published work is "Die Arbeiterfrage und das Christentum." Died in 1875. (See CHRISTIAN SOCIALISM.)

KIDD, BENJAMIN: Sociologist author; born in England, 1858. From 1877-96 in the English Home Civil Service. He has been a frequent and interesting contributor to the magazines, tho not always over his name, notably to *The Nineteenth Century*, *Review of Reviews*, *The English Illustrated*, *Cornhill*, *Longman's*, and others. His "Social Evolution" (1894) aroused remarkable interest. It argues that progress inevitably depends on natural selection and the struggle for existence, and that socialism, arising from the short-sighted working-class opposition to this struggle, cannot endure, but will end in increased State activity, not in owning or conducting industry, but in insuring competition by preventing all monopolies. Religion, he believes, has played a large part in civilization, by its superrational sanctions teaching an altruism the effect of which has been to lift up the weaker portion of the community to a place where they can more effectually compete with the stronger, and subordinating the individual to the necessary conditions of the struggle, for which otherwise there is no sanction in the individual's own reason. In "Principles of Western Civilization" (1902) he treats Western civilization as an integrating organism, from the standpoint of the increasing control over the present by the future. "The Control of the Tropics" (1898) deals with the subjects implied in the title. (See BIOLOGY; EVOLUTION.) Address: The Warders, Tonbridge, Kent, England.

KINDERGARTEN is the German name (meaning "garden of children") given by Friedrich Froebel (*q. v.*) to the "play school" invented by him for furthering the physical, moral, and intellectual growth of children. Froebel's observation of nature and his fondness for analogies drawn from trees and plants made him attach especial importance to the early years of childhood.

Pestalozzi, Comenius, and others, who attached much importance to the first years of life, looked to the mother as the sole educator. But, as in the case of the poor, the mother might not have time to attend to her children. Pestalozzi planned and Oberlin formed day asylums for young children. Schools of this kind took in the Netherlands the name of "play school," and in England of "infant schools." Froebel's conceptions differed, however, materially from those of the infant schools. He held that children should be educated physically, morally, and intellectually at once; that the essence of all education was to be found in rightly directed but spontaneous action, that at their age the most suitable and natural employment was play, especially games in which to imitate the parts they themselves will have to fill in after years. Froebel agreed with Montaigne that the games of children were "their most serious occupations."

Froebel embodied his ideas in "The Mother

Play and Children's Songs. His principles for child education prior to entering the regular school were: 1. The law of the connection of opposites, or the law of harmony and equilibrium. 2. The law of development, according to which the child is supposed to pass through the same stages as mankind. 3. The law of education through symbols, e. g., the nine "gifts" and "occupations"—being partly an attempt to develop the child by various simple figures, plain or solid, partly a preparation for future usefulness.

The first kindergarten was opened at Blankenburg, near Rudolstadt, in 1840, but after a needy existence of eight years was closed for want of funds. In 1851 the Prussian Government declared that

History

"schools founded on Froebel's principles or principles like them could not be allowed." But the idea had far too much vitality to be starved or frowned down. As early as 1854 it was introduced into England by the then famous Ronges.

The great propagandist of Froebelianism, the Baroness Marenholtz-Bülow, drew the attention of the French to the kindergarten from the year 1855, and Michelet declared that Froebel had "solved the problem of human education."

After 1872 the system spread rapidly, and is now more or less adopted in all European public-school systems, especially on the Continent. It has been most developed, however, in the United States. In 1854 Mr. Henry Barnard, of Connecticut, declared it "by far the most original, attractive, and philosophical form of infant development the world has yet seen," and wrote about it in the *Journal of Education* in 1856. Soon after, Miss Elizabeth Peabody, of Boston, established the first kindergarten in this country. In 1871 an American Froebel Union was established in Boston, merged later into the Froebel Institute of North America, established by Mr. W. N. Hallmann in 1882, and to-day kindergartens exist in all portions of the country. (See EDUCATION.)

Since most of the kindergartens are private institutions, no accurate figures can be obtained. Their growth in the U. S. is evidenced by these numbers: 1873, 43; 1882, 348; 1892, 1,311; 1898, 4,363. Of the total number in 1898 reports were received by the Commissioner of Education from 2,884 kindergartens with 5,764 teachers and 143,720 pupils. In 1903-4 there were 353 communities in the U. S. with over 4,000 population reporting 2,997 public kindergartens with 4,534 teachers and 191,882 pupils, an increase over 1902-3 of 14.2 per cent of communities, 10.3 of schools, 8.4 of pupils, and 12.6 of teachers. The private kindergartens were estimated in 1904-5 to have 105,932 pupils. Japan had in 1901 in all 254 kindergartens with 671 teachers and 23,671 pupils.

KINGSLEY, CHARLES: Author; Christian Socialist; born at Holne Vicarage, Dartmoor, Devonshire, 1819; educated at private schools, King's College, London, Magdalen College, Cambridge (graduating in 1842), the same year ordained curate of Eversley, in Hampshire, his home through all his life. In 1848 he published his first work, a drama, "The Saint's Tragedy," and soon after

"Twenty-five Village Sermons." In 1849, stirred by the Chartist movement and by the sufferings, particularly among the agricultural laborers and the sweated tailors of London, he threw himself into the Christian Socialist movement with the little company of clergymen and laymen that gathered around Frederick D. Maurice (*q. v.*) as leader. He declared himself in one passionate address "a Church of England parson and a Chartist."

In "Politics for the People" and the "Christian Socialist" (see CHRISTIAN SOCIALISM), he wrote "Letters to the Chartists," signed "Parson Lot." In his "Cheap Clothes and Nasty" he made a burning plea for the sweated tailors. Perhaps, however, he did his best work for social reform in his novels "Yeast" and "Alton Locke." With Maurice, he advocated and sought to establish cooperative shops. In politics he was a Tory. He wrote: "I expect nothing from the advocates of *laissez-faire*, the pedants whose glory is in the shame of society, who arrogantly talk of economics as of a science, so completely perfected, so universal and all important, that common humanity and morality, reason and religion must be pooh-poohed down." The Bible he considered the poor man's comforter and the rich man's warning. His program, however, was not radical. If he wrote: "My only quarrel with the Charter is that it does not go far enough in reform," he meant, he explains farther on, that the Chartists erred only in "fancying that legislative reform is social reform, or that man's heart can be changed by act of Parliament."

"We must touch the workman at all his points of interest," he wrote to Mr. Ludlow, "first and foremost at association, but also at political rights, as grounded both on the Christian ideal of the Church and on the historic facts of the Anglo-Saxon race. Then national education, sanitary and dwelling-house reform, the free sale of land and corresponding reform of the land laws, moral improvement of the family relation, public places of recreation—on which point I am very earnest."

In later life, altho not giving up his views, he greatly modified his expressions, and is said to have regretted his earlier intensity. He devoted himself to ecclesiastical and parochial and sanitary reforms. "Politics and political economy," he said in 1857, "may go their way for me. If I can help to save the lives of a few thousand working people and their children, I may earn the blessing of God."

In 1860 he was made professor of history at Cambridge, resigning in 1869. He became Canon of Chester, and, in 1873, of Westminster. He paid a lecture visit to America. Died at Eversley in 1875. Kingsley wrote "Hypatia" (1853), "Westward Ho" (1855), besides numerous other stories, volumes of sermons, etc.

KLEIN, GUSTAV ADOLF, DR., JR.: Imperial Privy Councillor, President of Senate in the Imperial Insurance Department; born at Darmstadt, Germany, 1863; studied jurisprudence, political economy, administration, and statistics at Berlin and Leipsic. In 1890 was Royal Prussian Gerichtsassessor. From 1891 to 1897 a member of the Imperial Statistical Department at Berlin; since 1895, Regierungsrat; since 1897 in the Imperial Insurance Department. From 1891 to 1897 he was engaged in compiling criminal and bankruptcy statistics, and the statistics of sick in-

surance; and since 1897 of the statistics of accident insurance. Author: "Atlas and Statistics of Workmen's Insurance"; "German Workmen's Insurance." Address: Imperial Insurance Department, Berlin, Germany.

KNEIS, CARL G. A.: Professor of national economics at Heidelberg, and one of the German Socialists of the chair (*q. v.*). His "Die Politische Oekonomie vom Standpunkte der Geschichtlichen Methode" (1853, 2d ed., 1883) formulates and completes with great precision the canons of the historical school (*q. v.*) of Hildebrand and Roscher (*q. v.*). He challenges absolutism in economics; and teaches that political economy should vary in different times and countries. His "Geld und Kredit" (1873-79) has become a classic.

KNIGHTS OF LABOR, THE: The order of the Knights of Labor was first organized as a local secret society in Philadelphia in 1869 by ten garment cutters. They had previously been organized as a trade-union, but dissolved this union and organized the new society mainly under the lead of Uriah S. Stephens, one of their number. The names of the others were James L. Wright, Robert C. Macauley, Joseph S. Kennedy, William Cook, Robert W. Keen, James M. Hilsee, David Westcott, W. H. Phillips, Washington Shields. On Dec. 30th the new society declared itself Local Assembly No. 1 of the Knights of Labor. Mr. Stephens was elected Master Workman. They decided to admit to their number working men, no matter of what occupation. They grew slowly; but a second assembly was not organized till 1872. During that year, however, twenty-seven assemblies were organized in Philadelphia. The first assembly organized outside of Philadelphia was an assembly of gold-beaters in New York City. Christmas Day, 1873, the first district assembly was formed. A general assembly was not formed till 1878, at Reading, Pa., when Mr. Stephens was chosen Grand Master Workman. Up to this time the order had elicited little general notice; it was strictly secret, with ritual and educational work in the principles of the labor movement. The following declaration of principles was adopted at this assembly, having been written in substance by Mr. G. E. McNeill (*q. v.*) for a labor congress at Rochester in 1874. It became from this time the principles of the order.

The alarming development and aggressiveness of the power of money and corporations under the present industrial and political systems will inevitably lead to the hopeless degradation of the people. It is imperative, if we desire to enjoy the full blessings of life, that unjust accumulation and this power for evil of aggregated wealth shall be prevented. This much-desired object can be accomplished only by the united efforts of those who obey the divine injunction: "In the sweat of thy face shalt thou eat bread." Therefore we have formed the Order of the Knights of Labor for the purpose of organizing, educating, and directing the power of the industrial masses.

It is not a political party, it is more—for in it are crystallized sentiments and measures for the benefit of the whole people; but it should be borne in mind, when exercising the right of suffrage, that most of the objects herein set forth can only be obtained through legislation, and that it is the duty, regardless of party, of all to assist in nominating and supporting with their votes such candidates as will support these measures. No one shall, however, be compelled to vote with the majority.

Calling upon all who believe in securing "the greatest good to the greatest number" to join and assist us, we declare to the world that our aims are:

1. To make industrial and moral worth, not wealth, the true standard of individual and national greatness.
2. To secure to the workers the full enjoyment of the wealth they create; sufficient leisure in which to develop their intellectual, moral, and social faculties; all of the benefits,

recreations, and pleasures of association; in a word, to enable them to share in the gains and honor of advancing civilization.

In order to secure these results, we demand at the hands of the law-making power of municipality, state, and nation:

3. The establishment of the Referendum in the making of all laws.
4. The establishment of bureaus of labor statistics, that we may arrive at a correct knowledge of the educational, moral, and financial condition of the laboring masses and the establishment of free state labor bureaus.
5. The land, including all the natural sources of wealth, is the heritage of all the people, and should not be subject to speculative traffic. Occupancy and use should be the only title to the possession of land. Taxes upon land should be levied upon its full value for use, exclusive of improvements, and should be sufficient to take for the community all unearned increment.
6. The abrogation of all laws that do not bear equally upon capitalists and laborers, and the removal of unjust technicalities, delays, and discriminations in the administration of justice.
7. The adoption of measures providing for the health and safety of those engaged in mining, manufacturing, and building industries, and for indemnification to those engaged therein for injuries received through lack of necessary safeguards.
8. The recognition, by incorporation, of orders and other associations organized by the workers to improve their condition and to protect their rights.
9. The enactment of laws to compel corporations to pay their employees weekly, in lawful money, for the labor of the preceding week, and giving mechanics and laborers a first lien upon the product of their labor to the extent of their full wages.
10. The abolition of the contract system on national, state, and municipal works.
11. The enactment of laws providing for arbitration between employers and employed, and to enforce the decision of the arbitrators.
12. The prohibition, by law, of the employment of children under fifteen years of age; the compulsory attendance at school for at least ten months in the year of all children between the ages of seven and fifteen years; and the furnishing at the expense of the state of free text-books.
13. That a graduated tax on incomes and inheritances be levied.
14. To prohibit the hiring out of convict labor.
15. The establishment of a national monetary system, in which a circulating medium in necessary quantity shall issue directly to the people, without the intervention of banks; that all the national issue shall be full legal tender in payment of all debts, public and private; and that the government shall not guarantee or recognize any private banks or create any banking corporations.
16. That interest-bearing bonds, bills of credit or notes shall never be issued by the government, but that, when need arises, the emergency shall be met by issue of legal-tender, non-interest-bearing money.
17. That the importation of foreign labor under contract be prohibited.
18. That in connection with the post-office the government shall provide facilities for deposits of savings of the people in small sums.
19. That the government shall obtain possession, under the right of eminent domain, of all telegraphs, telephones, and railroads; and that hereafter no charter or license be issued to any corporation for construction or operation of any means of transporting intelligence, passengers, or freight.

And while making the foregoing demands upon the state and national governments, we will endeavor to associate our own labors:

20. To establish cooperative institutions, such as will tend to supersede the wage system, by the introduction of a co-operative industrial system.
21. To secure for both sexes equal rights.
22. To gain some of the benefits of labor-saving machinery by a gradual reduction of the hours of labor to eight per day.

23. To persuade employers to agree to arbitrate all differences which may arise between them and their employees, in order that the bonds of sympathy between them may be strengthened and that strikes may be rendered unnecessary.

At the third annual General Assembly, Mr. T. V. Powderly (*q. v.*) was elected Grand Master Workman, and annually reelected till 1893. The order now began rapid growth and attracted general attention. There were at one time 700 local assemblies with some 500,000 members. Each year saw new growth. In the winter of 1885-86 there seemed to be a rush into organization. The railroad strikes in the Southwest (see STRIKES) and the excitement over the so-called Chicago anarchists (*q. v.*) turned the attention of working men everywhere to labor organization. At the

General Assembly of 1886 delegates were present representing 800,000 members, and it was claimed that the total membership was over 1,000,000. The growth was too fast. Men, without understanding the principles of the order, voted rash strikes. The general executive committee undertook too centralized an authority. Massing men of various callings into the same assembly, and failing sufficiently to respect the autonomy of the different trades, an opposition to this policy sprang up, eventuating ultimately in a split which culminated at the General Assembly of 1886, and resulted in the formation of the American Federation of Labor (*q. v.*), which does recognize the autonomy of each craft, and only federates the organizations of the various crafts into one general federation for general purposes. Since then the Knights of Labor have gone down and the Federation has grown. The order, however, was still for many years very powerful. In 1887 extensive headquarters were purchased in Philadelphia. A footing, too, was gained for the order in England and Belgium. Cooperative experiments were made, but proved unsuccessful. The order entered into political alliances with the Farmers' Alliance (*q. v.*), but little resulted from it save education.

In 1890 a journal was commenced called *The Journal of United Labor*, and later made a weekly and called *The Journal of the Knights of Labor*. The order continually losing ground, in 1893 dissensions led to the defeat of Mr. Powderly for reelection as General Master Workman, and Mr. J. R. Sovereign (*q. v.*) was elected in his place. Dissensions and desertions from the order have continued; it has mainly been used for political purposes, till at present the order numbers only a very few thousand men, with Simon Burns as Grand Master Workman, 518 Fourth Avenue, Pittsburg, Pa. (See **TRADE-UNIONS**.)

KNIGHTS OF ST. CRISPIN: The order of the Knights of St. Crispin was an organization in the shoe trade, first conceived by Newell Daniels, of Milford, Mass., in 1864. He moved West, and the first lodge of the order was organized in Milwaukee, Wis., in 1867. It spread East, and by 1868 a grand lodge meeting was held in Rochester, representing sixty chapters. Martin Gavin was chosen the first presiding officer. The aim of the order was to unite all shoe-workers, to obtain the control of the trade. During the next few years the order grew very rapidly, claiming 400 lodges and 40,000 members at one time, making it among the largest trade-unions of the world. It established a journal, attempted cooperation, entered politics; it conducted strikes and won many, but the reaction came, and divisions sprang up and led to desertions, till in 1874 it had almost disappeared. In 1875 it was revived in Massachusetts and defeated an attempt of the Lynn manufacturers to make their employees promise to belong to no organization. The revival, however, was temporary, and by 1878 the order was practically extinct. It had aimed at too much, and failed save in educating its members for wiser efforts.

REFERENCE: McNeill, *The Labor Movement*.

KORESHAN UNITY, THE: A communistic colony of the Koreshan Church in Estero, Fla. The first community of the order was established at Chicago, Ill., in 1886, and the colony at Estero in 1894, in 1903 the Chicago community removing

to Estero, with printing-plant, machine-shop, and other industries.

The Koreshan Unity is a religio-social organization, owning about 7,000 acres of land in Lee County, Fla., valued at over \$100,000. The total cost of machinery and tools owned by the community is \$18,675; the total assets, \$276,000; liabilities, \$20,594.

The Koreshan Colony is communistic and celibate. There is, however, an auxiliary order which admits of monogamic marital relations. The membership of the colony, embracing three settlements, is 200. The members of the auxiliary society (Arch-Triumphant) number 500. The total adherents to the Koreshan doctrines in various degrees of acceptance they estimate to be 10,000 throughout the world.

The church system is called the Koreshan Ecclesia. Its aim is the application of the laws of life and love to God and the neighbor for the attainment of immortality in the flesh.

Its Universology was founded in 1870 by Dr. Cyrus R. Teed, formerly of New York, and he is the Prime Counselor of the community. The title of the Pre-Eminent of the Koreshan Unity, the head of the church and its orders, is Victoria Gratia, who holds her position by appointment by the Founder.

The members of the colony are engaged in printing and publishing, boat-building, agriculture, orange-growing, pattern-making, metal-work, and steam-laundering. Lumber for buildings is supplied by their own sawmill, and cabinet-work and fine wood-work are turned out.

The colony publishes *The Flaming Sword*, a monthly. Address: V. G. Morrow, editor, Estero, Lee Co., Fla.

KOVALEVSKY, MAKSIM MAKSIMOVITCH:

Russian publicist, author, and sociologist; member of the First and Second Duma, from Kharkov; born in 1851; a graduate of Kharkov University, he studied afterward in Berlin, Paris, London, and was professor of civil law at the University of Moscow, 1877-87, but was discharged during the reactionary period. Afterward he traveled and lectured in Stockholm and Oxford. He founded the party of Democratic Reformers, with a program similar to that of the Constitutional Democrats. He established the "Free French University in Paris for Russian Youths" while living there, and was editor of *Strana* ("Country"), a paper devoted to various reforms. He is author of "The Origin of Modern Democracy," "Tableau des origines et de l'évolution de la famille et de la propriété," 1900; "La régime économique de la Russie," 1898; "Les questions sociales au moyen-âge," 1902.

KROPOTKINE, PETER ALEKSEYEVITCH:

Prince; anarchist; born in Moscow 1842; studied at St. Petersburg; in 1862 joined a regiment of Cossacks as lieutenant, but resigned and traveled for five years in eastern Siberia, collecting geological and geographical information. In 1867 he returned to St. Petersburg, studying science, and acting as secretary to the Geographical Society. In 1872 paid a visit to Belgium, and became interested in the International, along with Bakounin (*q. v.*). Returning to Russia, he joined the revolutionary circles, under the name of Borodin, and gave many secret lectures. Arrested in 1874, he was confined in the prison of St. Peter and St. Paul, but at the request of leading scientists was

allowed to continue his writings on the "Glacial Period." His health failing, he was transferred to the Military Hospital, whence in 1876 he escaped to England. In 1877 went to Switzerland; in 1879 founded the paper *Le Révolté* at Geneva (in 1885 transferred to Paris). Expelled from here, he was arrested, in 1883, in France, condemned to five years' imprisonment, but liberated by the President of the French Republic. In 1886 he helped to found the English anarchist-communist paper *Freedom*. He has since resided at Harrow-on-the-Hill, near London. He takes high rank as a geographer and geologist, and is the leader of the anarchist movement in England. His title of Prince he repudiates. He has written many articles and tracts: "Paroles d'un Révolté"; "Coming Anarchy"; "Scientific Basis of Anarchy"; "Appeal to the Young," etc. Address: Bromley, Kent, England.

KRUPP STEEL WORKS, SOCIAL WORK AT:

This firm, the largest steel factory of Germany, and the largest gun establishment in the world, had in its employ in all 41,600 persons (4,064 officials) on July 1, 1903, when it was turned into a stock company. The principal works are near Essen, but the company has over fifteen subsidiary companies and over 500 branches in Germany and other parts of Europe.

Already in 1861 the number of persons in the employ of the Krupp Steel Works at Essen had increased till the dwelling capacity of Essen was overtaxed. The firm began to think of methods to improve the situation. The first start in this direction was made in 1861-62. Two rows of houses, one with six dwellings and the other with four, were built for the foremen of the factory.

In the summer months of 1863 the first colony of workmen's dwellings, known as *Alt-Westend*, was built, and the houses rented to the employees. The buildings were simple, and, in the words of Mr. Alfred Krupp, intended for poor families who must save, but desire a healthful dwelling.

A second colony, called *Neu-Westend*, was completed in the winter of 1871-72 for 20,000 workmen.

In July, 1891, there were 3,659 dwellings (not including 43 dwellings given to widows rent free). There has been a net income of 2.5 on the capital invested, and this has been spent on other local improvements.

In 1903 there were 4,300 dwellings at Essen, arranged in 9 "colonies." The houses in the 4 older settlements, the 2 Westends, Schederhof, and Nordhof are not remarkable in any way. Cronenberg is, however, built on better lines. It has about 3,000 inhabitants who are housed in 1,750 dwellings of two- and three-story flats; each building is surrounded by small gardens, one for each family. The rent is seventy-five cents a week for a flat of three rooms, attic and cellar, and seventy-five cents a year for the garden. The streets and the market place are lined with trees.

Baumhof, built in 1890, at a little distance from the town, on cheaper land, offered the opportunity for a step forward. The buildings are detached, have two stories, accommodate three or four families, and are surrounded by larger gardens. The rent for five rooms and garden is about eighty-five cents per week, including porch and lobby \$1.

Alfredshof, erected 1894, still ranks as one of

the model villages, and is surpassed only by Altenhof, built a few years later, and on more generous lines. Altenhof is intended exclusively for aged employees and their widows; it contains 183 dwellings, all rent free, 159 each of three rooms for men with wives or daughters, 24 for widows. Every family in these two colonies has a large garden and a separate entrance. The roads are wide, lined with trees, well laid out, and connect the numerous small parks. The rental at Alfredshof is low, considering the accommodations. A detached house, facing an open space, with garden, porch, and lobby, parlor, reception-room, kitchen, two bedrooms, and cellars plus an attic, and free water, rents at \$1.50 a week.

The latest colony, Friedrichshof, is in some respects a return to the block system. But the mistakes of the buildings in the older colonies are avoided. Each block has a different design, altho in harmony with the others, and is surrounded by a large garden. The building line is, moreover, broken, so that each block gets plenty of sunshine. Every family has ample space, and the rooms on the fourth story are reserved for families whose needs have grown since they occupied a lower story.

Every colony has a market-place, beer-hall, a cooperative store, park, and music pavilion. The blocks for the firemen and foremen at the works proper and in Cronenberg are beautifully designed, contain three rooms, with closets, pantry, cellar, attic for each family, and a common laundry; rent, \$1.35 per week. There are bath-houses in every colony and at the works.

In addition to the 4,300 workmen's dwellings at Essen, the company owns 700 in four other colonies, Bredeney, Annen, Gaarden, and Bochum.

Dining-halls for single men are among the provisions made by the firm. At Essen there are 6 dining-rooms, *Menagen*, for workmen; 1 restaurant for officials at the magnificent clubhouse; and halls, where the employees bring their own lunch and buy coffee, milk, rolls, etc., at cost. The *Menagen* have had varying fortunes; started in 1856 with 200 men, they provided meals for 1,775 in 1873, 500 in 1875, 800 in 1894, and now about 2,000. At the Gruson works of the company in Buckau about 1,000 men take their meals in 3 dining-halls; and the same number in Bochum; in the latter to the playing of an orchestra.

Where opportunity for bathing is scarce, the company provides baths at nominal charges, e. g., at the mines near Hanover for 1,100 men; shower and tub cost 10 to 15 pfennigs; steam, 1 mark.

In order to provide the necessities of life at reasonable prices, Friedrich Krupp started a cooperative society for his employees in 1868. The firm managed it for a number of years, charging only enough to cover expenses; but later the society became cooperative in reality, profits being divided at the end of each year on the basis of the cash purchases of each member. This *Kassens-Austalt* has its own stores, bakeries, mill, butcher and tailor shops, shoe stores, etc. A building association has existed for many years.

There are a number of schools connected with the colonies. In addition to the elementary instruction required by the State, several schools provide instruction in various subjects of immediate practical value, e. g., arithmetic, drawing, etc., for apprentices; sewing, dressmaking,

cooking, housekeeping for girls, whose small fees are returned in the form of savings-bank deposits.

An extensive system of sick, accident, and old-age insurance exists in addition to those legally required by the State, both for employees and officials. All superannuated workmen and officials are pensioned; the former, or their widows, being provided for at Altenhof. The firm spends about 250,000 marks per annum on pensions alone, only about 25 per cent of which is required by the Imperial Insurance Law. The total outlay of the firm in regular contributions to the various insurance, pension, and benevolent agencies amounted to about 3,100,000 mk. in 1902. A board of physicians has been formed whose sole duty is to look after the health of the employees and their families. Two other funds were established by F. A. Krupp in 1887. One was a gift of 1,000,000 mk., the interest of which is to be distributed in pensions to those employees who need them but cannot get them owing to some technicality; and to those whose regular pensions are insufficient to keep them from want.

The other was a gift of 500,000 mk. to the city of Essen, the interest to be applied for moral and material improvements of working men. It is at present devoted to building laborers' dwellings, that being considered the most pressing need.

In order to make provision for recreation and for the social and intellectual development of his men, Mr. Krupp built club-houses for the officials of various grades, and established a literary society and two libraries—one general with over 38,000 volumes, the other technical with over 40,000. About 1,100 papers and magazines are provided for the different reading-rooms.

Lest his men might not be able to avail themselves of these numerous means for development and recreation by too long hours or weariness, the firm voluntarily reduced hours of labor from eleven and a half to ten.

RUDOLPH M. BINDER.

L

LABOR: As correctly used in economic science this term may be defined as work done by mind or body in producing wealth (see PRODUCTION; WEALTH). The word, however, is often popularly used to represent the class who mainly live by labor, in contradistinction to capital, meaning thereby those who mainly live by capital. This is not to deny, however, that many capitalists also labor and that the work of the supervision of industry and the production of capital is not true labor.

Even those who maintain, as did Adam Smith, and as most German Socialists and American trade-unionists still do, that labor is the sole source of VALUE, never claim that manual labor is the only kind of productive labor. Every one recognizes the need and value of the labor of management, the labor of the mind, in various ways. Manual and artizan labor is principally referred to in such phrases as "the labor movement," not because it is regarded as the only kind, but because it is that kind of labor which those who engage in the movement believe to have been most wronged in the past and most to need having wrongs righted in the present. All Socialists, all trade-unionists, all working men recognize at least some kinds of mental labor as necessary factors in production. (For the kinds of labor that some consider unproductive, see PRODUCTION.) Some have limited the word labor to painful labor. Jevons says ("Political Economy," v.): "Labor, I should say, is any painful exertion of mind or body undergone partly or wholly with a view to future good." But this is undoubtedly misleading, if the word painful be understood in its ordinary sense, and partakes too much of views now generally condemned which largely put a despoite on manual labor. The labor of an artist, of an inventor, of a teacher, of a carpenter, of a farmer, need by no manner of means be always painful. Ruskin's definition is: ("Unto this Last.") "Labor is the contest of the life of man with an opposite; the term life including his intellect, soul, and physical power, contending with question, difficulty, trial, or material force."

Of the importance of the part played by labor in production there is no question and need be no statement. To the problems connected with labor this encyclopedia is devoted. (Concerning the reward of labor, see WAGES. Concerning the statistics of laborers, see OCCUPATIONS. Concerning the condition of laborers, see POVERTY; WAGES; WEALTH. Concerning the history of labor in the past, see SLAVERY; MIDDLE AGES; GILDS. Concerning the history of the labor movement in modern times, see the different countries; and TRADE-UNIONISM; EIGHT-HOUR MOVEMENT; SOCIALISM; ANARCHISM, etc.

LABOR BUREAUS: (see also LABOR EXCHANGE, and for Labour Bureaux as the term is used in England, see PUBLIC EMPLOYMENT BUREAUS): Labor bureaus, in the American sense of the term, are government bureaus (state or national) which concern themselves with matters relating to labor.

In the French Revolution of 1848 a department of labor was established (see ATELIERS NATIONAUX), and employment bureaus have existed from early times; but the first Bureau of Labor, in the American sense of the word, was the Massachusetts Bureau of Statistics of Labor, established June 23, 1869, as the result of an agitation conducted by the Boston Eight-Hour League (see EIGHT-HOUR MOVEMENT), mainly led by Mr. George E. McNeill, with the aid of Wendell Phillips and others. The first chief of the bureau was General H. K. Oliver, with Mr. George E. McNeill as deputy. Pennsylvania was the next state to follow, establishing a bureau in 1872, other states falling into line later, till now (1907) there are in the United States, including the federal bureau, thirty-three labor bureaus. These offices have various titles, but their duties are similar, and consist almost solely in gathering statistics of various kinds that bear in some way upon the condition or the interests of labor. The work they do is of somewhat varying value, according to the character of the men in charge, and according to the amount of money placed at

their disposal for the collecting of statistics. The statistics collected by some of them will scarcely bear any scientific analysis, while those of even the best of them—a place often accorded to the Massachusetts bureau—are often sharply criticized. Nevertheless, the good they have done in collecting information can scarcely be exaggerated, and most of their reports are reliable and of great value.

The bureaus of South Dakota and Utah have been discontinued. That of Kentucky, up to date, has not concerned itself with the immediate interests of labor.

The National Bureau of Labor at Washington, D. C., was created as an office in the Department of the Interior by act of Congress, approved June 27, 1884, and organized Jan. 22, 1885, by the appointment of Carroll D. Wright, of Massachusetts, as commissioner, who held the office till 1905, when his successor, Dr. Charles P. Neill, was appointed. This bureau, in 1888, became the Department of Labor. This act was the result of a demand on the part of the Knights of Labor and other labor organizations. The bureau now, however, is connected with the Department of Commerce and Labor.

The chief officer of each of the state bureaus is located at the capital of the state in which he serves, with three exceptions, in Maryland, at Baltimore; in California, at San Francisco; and in Louisiana, at New Orleans. The salaries paid the commissioners are \$5,000 for the U. S.; \$3,500 for New York; \$3,000 for California and Massachusetts, and from \$2,500 to \$1,200 in other states. The Secretary of State is ex-officio commissioner of labor in Colorado and the governor in Nebraska. The U. S. Federal Department of Labor spends some \$175,000 per year and has 103 employees; New York spends \$130,400, with twenty-two employees; Illinois, \$52,450, with five employees; Massachusetts, \$31,674, with twenty-five employees. No other state has over six employees.

Congress occasionally directs special investigations to be made, and appropriates money for the purpose, as in the case of an inquiry into the statistics of marriage and divorce and into the industrial and technical school systems. It also provides by special acts for the printing and binding of the annual reports. These are usually sent free of cost to all persons in the U. S. who apply for them if the supply admits. They are also sent in exchange to all government officials or other persons in foreign countries who have rendered the department a service by forwarding to it their own publications. If the supply is not exhausted, they are sent to other distinguished foreigners who express a wish for them.

In Nov., 1895, the department commenced issuing a *Bulletin* of about 250–300 pages, issued every other month.

The following are the most important reports of the U. S. Bureau:

- 1886. No. 1. Industrial Depressions.¹
- 1886. " 2. Convict Labor.¹
- 1888. " 4. Working Women in Large Cities.¹
- 1889. " 5. Railroad Labor.¹
- 1890. " 6. Cost of Production: Iron, Steel, Coal, etc.¹
- 1891. " 7. Cost of Production: The Textiles and Glass (two volumes).¹
- 1892. " 8. Industrial Education.¹
- 1893. " 9. Building and Loan Associations.¹
- 1895–6. " 11. Work and Wages of Men, Women, and Children.
- 1897. " 12. Economic Aspect of the Liquor Problem.

- 1898. No. 13. Hand and Machine Labor (two volumes).
- 1899. " 14. Water, Gas, and Electric-light Plants under Private and Municipal Ownership.
- 1901. " 16. Strikes and Lockouts (Jan. 1, 1881, to Dec. 31, 1900).
- 1902. " 17. Trade and Technical Education.
- 1904. " 19. Wages and Hours of Labor.
- 1905. " 20. Convict Labor.
- 1906. " 21. Strikes and Lockouts.

SPECIAL REPORTS

- 1889. No. 1. Marriage and Divorce.¹
- 1893. " 4. Compulsory Insurance in Germany, etc.¹
- 1893. " 5. The Gothenburg System of Liquor Traffic.¹
- 1894. " 7. The Slums of Baltimore, Chicago, New York, and Philadelphia.¹
- 1895. " 8. The Housing of the Working People (with plans and illustrations).¹
- 1904. " 10. Labor Laws of the U. S.¹
- 1904. " 11. Regulation and Restriction of Output.
- 1905. " 12. Coal Mine Labor in Europe.

SOME LEADING ARTICLES OF THE BULLETIN

The Bulletin is issued every other month

- No. 1. Private and Public Debt in the U. S., by George K. Holmes.
- " 4. The Sweating System, by Henry White.
- " 6. Cooperative Distribution, by Edward W. Bemis, Ph.D.
- " 7. Industrial Communities, by W. F. Willoughby.
- " 8. Railway Relief Departments, by Emory R. Johnson, Ph.D.
- " 10. Condition of the Negro in Various Cities. Building and Loan Associations.¹
- " 13. The Anthracite Mine Laborers, by G. O. Virtue, Ph.D.

In Great Britain a Labor Department of the Board of Trade was created in 1893, and issues the *Board of Trade Labour Gazette* monthly, an annual report (almost purely statistical), and special reports on labor in foreign lands, wages and hours of labor, etc. In Europe and elsewhere various governmental offices or bureaus or departments cover this ground under the following names and with the following publications:

- Austria*.—Arbeitsstatistisches Amt in K. K. Handelsministerium (1898) publishes *Soziale Rundschau*, a monthly bulletin.
Argentina.—Departamento Nacional del Trabajo (1907), *Boletín*, Q.
Belgium.—Office du Travail (1895) publishes *Revue du Travail* semi-monthly and annual reports.
Canada.—Department of Labor (1900) publishes a *Labor Gazette* monthly.
Denmark.—Bureau de Statistique de l'État (1850) publishes *Communications Statistiques* irregularly.
France.—Office du Travail (1891) publishes *Bulletin de l'Office du Travail* monthly, and an *Annuaire Statistique*.
Germany.—Kaiserliches Statistisches Amt Abteilung für Arbeiterstatistik (1902) publishes *Reichs-Arbeitsblatt* monthly, and bulletins irregularly.
Italy.—Ufficio del Lavoro (1902) publishes *Bollettino del Ufficio del Lavoro* monthly.
Netherlands.—Centraal Bureau voor de Statistiek (1892) publishes *Maandschrift* monthly.
New South Wales.—Department of Labor and Industry (1895) *Annual Report and Statistics*.
New Zealand.—Department of Labor (1891) publishes *Journal of the Department of Labor* monthly.
Norway.—Det Statistiske Central Bureau (1902) publishes *statistiske irregularly*.

LABOR CHECKS: An idea put forth by some Utopian Socialists (among others, Lawrence Gronlund) according to which, under socialism, every one will work for the common good, and will be paid checks stating that he has labored so many hours, these checks to be good for purchases at the various stores of the commonwealth. English Fabian Socialists reject and laugh at the whole idea. Most Socialists, however, neither reject nor accept the idea, believing that socialism,

as distinctly evolutionary, will work its way step by step, and leave such details as labor checks to be devolved when the time comes, if it then seem wise. (See SOCIALISM.)

LABOR CHURCH: A movement in England which began in 1891, mainly under the initiative of John Trevor, to organize the religious impulses of the labor movement. The first Labor Church service was held in Charlton Town Hall, Manchester, on Sunday, Oct. 4, 1891, consisting of the singing of hymns, reading, prayer, and an address by John Trevor. Different speakers spoke alternate Sundays with Mr. Trevor, and in November a Labor Church was organized with the following principles:

1. That the Labor movement is a religious movement.
2. That the religion of the Labor movement is not a class religion, but unites members of all classes in working for the abolition of commercial slavery.
3. That the religion of the Labor movement is not sectarian or dogmatic, but free religion, leaving each man free to develop his own relations with the power that brought him into being.
4. That the emancipation of labor can only be realized so far as men learn both the economic and moral laws of God, and heartily endeavor to obey them.
5. That the development of personal character and the improvement of social conditions are both essential to man's emancipation from moral and social bondage.

During the winter of 1892-93 several more churches were formed, in each case the demand being entirely local and spontaneous, and in July, 1893, a conference of Labor Church delegates was called and a Labor Church Union was formed. At this conference ten churches were represented; a constitution was drafted, which was confirmed by a later conference, and a council was appointed.

By 1894 there were twenty-four Labor churches in England and Scotland.

For some years the movement showed considerable vitality. Labor Church Sunday-schools were formed and in some places the Labor churches attracted large audiences. Gradually, however, the movement waned before its many difficulties. Want of funds and failing health prevented Mr. Trevor from giving all his time to the movement. In 1900 there were some fifteen Labor churches. In 1902 there was some revival of interest and in 1903 a conference was held at Hyde, Cheshire, and a new impetus given to the movement. The statement of principles now reads:

That the Labor Church exists to give expression to the religion of the Labor movement.

That the religion of the Labor movement is not theological but respects each individual's personal convictions upon this question.

That the religion of the Labor movement seeks the realization of universal well-being by the establishment of socialism—a commonwealth founded upon justice and love.

That the religion of the Labor movement declares that improvement of social conditions and the development of personal character are both essential to emancipation from social and moral bondage, and to that end insists upon the duty of studying the economic and moral forces of society.

Under this new impulse new churches have been and are being formed, so that there are now (1907) upward of thirty Labor churches in the country. A revised hymn-book was published in 1906.

A pamphlet is in preparation dealing with "The Labour Church and Its Principles" and may be had from John Mitchell, Hon. Sec. L. C. U., 13, Moorwell Place, Ecclehill, Bradford, England. Also, any other information relating thereto, including Labor Church Sunday-Schools.

JOHN MITCHELL.

¹ Bulletin out of print.

In 1894 a Labor Church was started by Herbert N. Casson, at that time a militant Socialist, in Lynn, Mass., but continued only two or three years. In some other countries labor or socialistic services or Sunday-schools have been started, but have had little or no permanent life. See, however, **SOCIALIST SUNDAY-SCHOOLS UNION**, Alfred Russel, Secretary, 366 New City Road, Glasgow. For a fuller account of the Labor Church in England, see an article by John Trevor, in the first edition of this encyclopedia.

LABOR COLONIES: The idea of the farm and labor colony is a comparatively new one, altho such colonies have been established in Germany for twenty-three years and in Holland for over eighty years.

There can be no doubt that the idea of the colony originated with the feeling of social reformers that the land question and the unemployed question were inseparable, that for several classes of the unemployed almost the only resource is work on the land, which, at any rate, offers to the workless a chance of productive and useful employment. General Van Den Bosch, the founder of the Society of Beneficence in Holland, realized the truth of this when he started the first Dutch labor colony at Frederiksoord in 1818 with the motto, "Help the people and improve the land."

If there were no land needing cultivation, or if land, as in England, were not at the present time going out of cultivation, the case for drastic action would not be strong, but the soil cries out for labor and many great tracts of the country have become a wilderness. Bring the waste labor in contact with the waste land and both will be improved, or, as Commander Booth Tucker of the Salvation Army put it to Mr. Rider Haggard, "put the waste labor on the waste land by means of the waste capital and thus convert this trinity of waste into a unity of production." This much we can say without seeming in any sense to run the risk of exaggeration, that such an experiment is worth making everywhere. It is only a very broad generalization, but it gives a clue to the sort of line all who are interested in farm and labor colonies are beginning to take.

Whatever type of colony we may think it desirable to start, there are several important questions to be answered. Is our expenditure a real saving? Does this method of treatment conduce to the upbuilding of the man and the reclamation of the land? Are there any illustrations showing that such men as the colony helps have been made self-supporting? If such results can be achieved in any measure, are we justified in pursuing our experiments and in urging others to attempt them?

I. Colonies for the Unemployable

Before proceeding to deal with labor colonies that are especially suited to the various classes of the unemployed, it is necessary to clear the way by a short statement respecting the labor colony method of treating the so-called unemployable, including in our category not only the vagrant and the mendicant, but also those who are physically incapable of following ordinary industrial employment in the town. We may begin with this latter class. Generally speaking, men who are unemployable in the ordinary sense owing to physical causes, and yet might be employed on the land with good results to themselves, are the epileptic and the feeble-minded,

The adult epileptic is still in a sad plight as compared with many other sections of the community who have suffered from misfortune or sickness. Some of them, a large number, are to be found in our workhouses, where they receive a treatment which cannot be said to be either scientific or humane. The majority of them are still to be found living in the homes of the very poor, a grievous burden to the family itself, and somewhat of a trial to all the neighbors. Many of these epileptics, gradually becoming feeble-minded, suffer ill-usage from rough and foolish lads, and in any case little or nothing is done to lighten their sad condition or to make them useful to the community.

In many cases they can be employed in healthy outdoor labor such as will interest and occupy them to the required extent without taxing too much an enfeebled brain or greatly fatiguing the body.

Such work can best be found upon the land, and a colony offers employment which is not only conducive to health but also will allow of an epileptic being employed in a great variety of ways. In such a colony the work would necessarily be under the advice and guidance of the medical man, but in almost any case some proportion of the food required to maintain him could be produced by this necessary and beneficial labor. It is unfortunate that so few of these colonies are in existence. What the Christian Union for Social Service is doing for epileptic children at Lingfield and Starnthwaite in England, ought to be done for adult epileptics in all parts of the world.

The Chalfont Colony in England is in its infancy, but has already completely justified its existence. This colony has gradually increased in efficiency of organization as well as in size year by year. In 1895 the average number of colonists was twenty-four, the total expenditure £1,719, the cost of maintenance of each colonist being £71 12s. 6d., but in 1901, with an average of 134½ colonists, the cost was only £5,333, the per capita cost of maintenance being reduced by 55 per cent. On the average in the colony there are about twice as many males as females. The male colonists are principally employed in the building department, carpentering, plumbing, painting, bricklaying, and smiths' work; the remainder are chiefly occupied in farm and garden work, while about half a dozen are engaged in basket-making. They take it in turn to give their services in the home as required. Of the female colonists nearly half are employed in the laundry, the remainder chiefly occupied by the housework and needlework, but a good deal of stress is laid on the necessity of plenty of fresh air daily.

The colony at Bielefeld in Germany is by far the most important colony of its sort in the world. Over 2,000 epileptics are there cared for, and altho many of them are children, a large number of adults are being treated, and some permanent cures effected. Of late years greater care in diagnosis and in the use of bromide have resulted in a larger percentage of cures, while the open-air work on the land, both in the neighborhood of Bielefeld and at the Wilhelmsdorf Colony, has very greatly contributed to the success with which adult patients have been treated.

What has been said with regard to epileptics applies with equal force to the *feeble-minded*, who are a constant responsibility in our workhouses and asylums, where the treatment is costly, when

under the conditions which special colonies offer the best of them might contribute something to the cost of their maintenance by labor, while their mental faculties might be trained in various ways. So far as the children are concerned, all that need be said is that epileptic and feeble-minded children become unemployable in later years, so that the colonies for them which have already been established are fulfilling a very real and pressing need.

The same treatment might also be meted out to the inebriate, who is far more likely to recover under the healthy and normal influences which he or she finds in a country colony. Granted the right kind of management, there is no reason in the world why such colonies should not be the most potent means in restoring to the ranks of the employed those who have put themselves outside the pale of citizenship by habits of intemperance.

But perhaps the largest section of the unemployable is the vagrant and tramp class to be found in the U. S. as well as in Europe—both men and women who are quite capable of working, but who have degenerated and become demoralized, it may be by lack of work, possibly by lack of training, or by evil conditions in their youth. The vagrant is constantly on the lookout for opportunities of obtaining food and lodging without giving work in return. He habitually depends upon charity, and finally becomes a danger to the whole community. Whatever causes may have contributed toward the making of the vagrant, whether hereditary disposition or lack of training in youth, physical deficiency, or unemployment, the truth is that a nomad class has been created which the casual ward of the workhouse does nothing to destroy but rather tends to encourage. A Departmental Committee on Vagrancy in England has recently reported on the subject. There seems to be a general consensus of opinion in the committee that some modification of the Belgian penal system will have to be introduced, and that feeling found expression in the report issued in 1906.

Several small commissions have visited the colony at Merxplas, near Antwerp, which, with two other colonies, is the Belgian Government's attempt to stamp out mendicancy. In Belgium vagrancy is not, strictly speaking, a penal offense, but it is regarded as so much of a social danger

as to require special treatment, and by Article 13 of the Law of 1891 the *Juge de Paix* has authority to order the removal of a vagrant convicted of begging to the great penal colony at Merxplas known as a "Dépôt de Mendicité." The methods employed appear to be much more strictly repressive than redemptive. M. Stroobant, who is at the head of this colony, stated emphatically that the object of Merxplas was repressive. To quote his own words: "It taught men to work and to work regularly; it saved them from their own vices—the vices that had brought them there—but it did not seem to prevent them from going back over and over again." The colony compels men to work at agriculture, manufactures, forestry, and household employment. Soldiers conduct the agriculturists to their various fields, altho it is not very difficult for colonists to escape. This seems to cause no anxiety to the director, who says that if they can get work and are willing to do it, all the better, and that if they are unwilling to work they are sure to fall into the hands of the police and be returned again to the colony.

Merxplas is practically self-supporting, and whatever the disadvantages, there is no comparison so far as cost is concerned between the Belgian system and the casual ward system of England. Including the small wages that are paid to the colonists—and the wage system ought certainly to be adopted in England at a compulsory labor colony—and taking even the aged and infirm into account, the entire cost is under £10 per head per annum, and the small wages will account for at least half of this.

In addition to the colony at Merxplas with 4,500 men, there is one at Wortel and another at Hoogstraeten, the three colonies between them possessing about 3,000 acres of land. The two latter colonies form one establishment and are known as a *maison de refuge*. They are not penal in the strict sense, and are tending to become rather the resort of the aged and the infirm. The number of colonists is greatly increased by severe weather. Hoogstraeten would have about 800 in summer and about 1,500 in winter; Wortel 450 in summer and perhaps three times that number in winter. Very few of the colonists are young men, and the conclusion to which we are forced—and with this conclusion both M. Leroy, the "Director Principal," and M. Stroobant, the director at Merxplas, agree—is that the genuine unemployed man is relieved outside the colony, and that almost the only men who are sent to the colony are professional beggars or habitual drunkards.

A similar system, not so thoroughly carried out, prevails in Holland, where there are three government colonies which may be described as penal for beggars and tramps, Veenhuizen and Hoorn being for men, and the national workhouse at Leiden for women. The former is for vagabondage proper, while at the two latter habitual drunkards are also admitted. The present population of Veenhuizen is about 3,600, divided into three sections, and the work consists chiefly of forestry, agriculture, gardening, and various handicrafts, such as weaving, carpentering, masonry, smiths' work, and the manufacture of furniture, boots, and clothing. The colonist prisoners enjoy a certain amount of freedom within the colony, and have a very small allowance for wages.

II. Colonies for the Lower Class of the Unemployed

In considering the question as to how far the labor and farm colonies may be of assistance to the unemployed we have to remember that the unemployed themselves can be broken up into many classes, and that for each of these classes some provision should be made whether in the town or in the country. It has not yet been definitely proposed that skilled men who are usually employed during a large portion of the year, but who are thrown out of work by some severe depression in trade which affects large districts of the country, should be assisted at a labor colony, but for almost every other class such a method might very well be adopted, altho each class would have to be considered separately, and modifications of the colony system would have to be introduced to suit their varying needs and circumstances.

The section which bulks most largely in the public imagination, and in all our large industrial centers is perhaps the most difficult problem, is the class of unskilled laborers. What is wanted

for this class of man is a colony which will utilize his services to the fullest possible extent, and meanwhile, by this inducement to regular work, so increase his physical powers and capabilities that he may be able once again, if necessary, to obtain a situation in the regular

The Insufficient

ranks of industry. There can be no harm done in trying to restore hope and strength to the thousands of men who, owing to lack of work, enterprise, or character, have become hopeless and demoralized.

To meet the need of such men boards of guardians in England have for many years been attempting to discover some expedient, and the labor colony has often been suggested, but until quite recently no board was in a position to be able to make such an experiment until the Poplar Guardians obtained possession of a farm at Laindon in Essex. Mr. Joseph Fels offered the board that, if they would open up and maintain a farm colony somewhat on the lines of the successful experiments made both in England and abroad, he would be willing to purchase a suitable tract of land and place it at the disposal of the Guardians free of rent. He submitted a definite offer of 100 acres of land at a peppercorn rent for a period of three years, with the option of purchase at or before the expiration of that term for the price originally paid for the land. The local government board gave their consent, and a farm of 100 acres at Dunton, near Laindon, was purchased by Mr. Fels for the sum of £2,125, including a house and farm buildings, and full possession of the farm was obtained by the Guardians on March 5, 1904. Beginning with six men in June, 1904, the number rapidly grew to 100 in August, and since that time fifty additional men who were unemployed have been sent down under a separate regulation through the Central Unemployed Committee from the borough of Poplar. These men on the whole have worked to the satisfaction of the superintendent, and as a result of their work, not only has a large reservoir capable of storing 200,000 gallons of water been constructed, but a considerable portion of the farm has been thoroughly dug and planted, and progress made in the work of recovering much of the land that up to recent times was derelict.

Since that date a similar farm has been purchased by the West Ham Board of Guardians, and that such outlets for the waste labor of the workhouse will not be uncommon in the near future is evidenced by the fact that nearly a dozen boards are seriously considering the question of following the example of Poplar.

Starting, then, with the unskilled but able-bodied inmate of the workhouse, we come to the unskilled laborer, married or unmarried, who has received not so much direct relief from the poor-law as indirect charitable contributions from benevolently disposed persons and societies. We have many examples of the attempts that have been made both in England and abroad to meet this special difficulty, but none of them have taken account of the need for classification if effectual remedy is to be applied.

Generally speaking, it may be said that the colonies which serve the purpose above indicated are modeled on the German plan—a plan which is not wholly successful owing to this lack of classification. In England we have the Salvation Army Colony of Hadleigh, the Lingfield Training Farm, Libury Hall (a colony founded by the

German Labor Colony Central Board), while in Germany there are about thirty colonies under this same board, capable of receiving in all some 4,000 men. All these colonies are run by philanthropy, tho the German colonies are subsidized by the provincial governments.

The Labor Colonies Central Board was founded in Oct., 1888, on the initiative of Pastor Von Bodelschwingh, who started Wilhelmsdorf the year before. The colonies now under the board (thirty country and three town) are charitable institutions on religious lines, to which all able-bodied men able to work are admitted without distinction of character or religion so long as there is room. The only form of punishment is dismissal, and colonists dismissed for bad behavior cannot be admitted into another colony without the consent of the colony which discharged them.

The colonies are supported by (a) grants from the provincial governments, (b) municipalities, (c) donations, subscriptions, collections. The colonies are scattered throughout the length and breadth of the German Empire, and it is quite probable that the number will be increased. The average amount needed to be made up by subscriptions and donations after deducting the profit or adding the loss on the farms and industries is between five and six shillings per colonist per week; the expenses of administration and interest on borrowed capital are included. So far as possible an attempt is made to arrange for the fluctuation of the labor market, since there are nearly twice as many men in a colony in winter as in summer. The result is that the winter work is supplemented by the reclamation of waste land either on the colonies themselves or on the property of neighboring landowners. One difficulty we may foresee in the future is the impossibility of obtaining more land to reclaim in the neighborhood of the colonies. It may be necessary in this case to sell or lease the farms and to establish other colonies elsewhere. There is a growing feeling—a feeling which the writer found was strongly expressed at Bielefeld—that it would be necessary in the future to classify somewhat more strictly than in the past.

The radical fault of all the German colonies is the admixture of classes. Varying reports have been received and published with regard to these colonies, but a careful investigation on the spot seems to show that the Board of Trade report has somewhat exaggerated the number of men who may be called "criminal." Roughly speaking, 20 per cent would be criminal, 20 per cent first offenders (that is to say, men charged with mendicancy or vagrancy), about 50 per cent men of somewhat weak will—deficient in some respect or below par in physical and mental ability—while about 10 per cent would be willing and industrious men of good character unemployed through no fault of their own. It is, however, for the 50 per cent referred to that this class of colony is required. A much more satisfactory result would be produced if the criminal could be separated off from the man of fairly good character, and if again the genuine unemployed could be given a trial in another colony where opportunity would be offered, if necessary, of permanent work upon the land.

The best results that have been produced in Germany can be witnessed at Lühlerheim. The British Board of Trade report gives Wilhelmsdorf as an example, but Wilhelmsdorf, tho the oldest of these colonies, is somewhat handicapped by

being closely connected with the epileptic colony at Bielefeld, the result being a larger proportion

German Colonies

of mentally and physically "below par" men than would otherwise be the case. Lühlerheim has the advantage of a rather exceptional man in the person of Herr Siemon, who was at the head of the farming work of the Rauhe Haus, near Hamburg. He has created out of somewhat uncompromising material in the shape both of waste land and waste labor, what must be regarded as an extremely successful labor colony. The buildings have been, in the main, constructed by the colonists with a very little paid skilled assistance. The colony itself is gradually being transformed from a tract of barren and sandy soil, which refused to grow anything owing to the hard ochreous spit beneath the surface, into a fertile and productive farm. The cow-sheds and piggeries, two very important factors in the success of the colony, were constructed by the colonists under skilled superintendence. The general result witnessed is the partial reclamation, at all events, of a large percentage of the men at a cost of something like two shillings and sevenpence per head per week—about half the cost of any other colony in Germany, and less than half the cost of any similar experiment in England. If Lühlerheim could pick and choose its men, rejecting only those who have any radical moral or physical defect, it might almost become self-supporting. What is needed in Germany is the establishment of colonies side by side with the existing institutions into which could be drafted either the worst or the best of the men who from time to time resort to these harbors of refuge. Classification in this respect would, I feel confident, result in real economy, and it would at the same time render the scientific and reformative treatment of the lowest type much more possible.

Returning for a moment to the English colonies, we are struck with the fact that both Hadleigh and Lingfield labor under peculiar difficulties owing to the inadequate financial support which they receive, especially from the authorities which are most indebted to these colonies for assistance. The provincial governments in Germany do, at any rate, subsidize the colonies to some extent (about one third of the cost being derived from such sources), but in England both Hadleigh and Lingfield, apart from private subscriptions, have only the Boards of Guardians to look to, if we except the work of the Mansion House Fund and Central Unemployed Committee in connection with Hadleigh during the last two winters. In any case, the financial support derivable from such sources barely covers the cost of maintenance, and the men who are sent by Boards of Guardians, so far from being selected with a view to their permanent benefit, are often the hopeless ne'er-do-wells who would cost such boards a larger sum if they remained in the workhouse.

In this sense especially, apart from its work among epileptic children, Lingfield may be regarded as a sort of subsidized Poor Law Colony, and it is to the credit of the director and those in charge that satisfactory results have been obtained to a very considerable extent. This colony consists of a farm of 250 acres, and has now been in existence for over nine years. It accommodates some fifty or sixty men of vari-

ous types, thus described by the director, the Rev. J. L. Brooks:

(1) Youths with physical defects; others dull-witted or half-witted. These were, for a considerable time, the only cases that Guardians would send.

(2) Men at the other end of life, nearly all over fifty years of age. A few of these would spend the remainder of their days in the workhouse; but, on the land, would be able partly or wholly to maintain themselves for some years.

(3) The ne'er-do-wells sons of lower middle-class homes, who are exceedingly difficult to direct.

(4) The drunkards. Of these last the colony has had, among the 500 men who have been through it, 120.

He claims, however, to have been able to rehabilitate and restore to mental, moral, and physical health, 33 per cent of the cases put in his hands, and surely there can be no question whatever that if Lingfield can do this with the material at its command it is an institution which should receive consideration at the hands of the State. The cost is not extravagant as compared with the poor-law. It works out at nine shillings per week per man, exclusive of clothing, the chief item being food, four shillings and twopence per week; lodging and laundry, two shillings and twopence; superintendence, one shilling and sixpence; waste and medical care, sixpence. In such a colony farming cannot be made to pay, that goes without saying; the real assets may be described as the "helpless lives made useful, waste lives reclaimed, the drunkards restored, and mischief prevented."

Hadleigh is a larger colony, run on somewhat different lines by the Salvation Army. It consists of an area of about 3,000 acres of which some 400 are let off at present to a farmer. It is situated four miles from Southend. The land is a stiff clay, rather poor and cold in character, but it is rapidly improving in value. About 100 acres are planted with fruit-trees, and the total receipts from the fruit farm, its pastures, market gardens, chicken farms, and brick works in 1904 amounted to over £33,000. The population on the land near by has as a result of the colony greatly increased, and Hadleigh village now numbers over 1,300, and in many respects is quite thriving. Here again the difficulty crops up of the great mixture of men which Hadleigh receives—many of them taken from the shelters in the town, some supplied by Boards of Guardians, while a few are capable, willing workers who are unemployed for the time being, or who have come down through misfortune; the remainder are weak, unsatisfactory men sent by philanthropic societies, by relatives and friends. The best of these men Hadleigh seems to have little difficulty in restoring once more to a permanent occupation, or if they cannot be so restored they are usually emigrated. The majority require a longer period of treatment than the colony, for many reasons, is able to give, and the result is that much of the labor is thrown away. Both Hadleigh and Lingfield should be subsidized by the government, and thus enabled to deal exclusively with the men who need the reforming and reclaiming influence which such men as their officers are able to bring to bear.

The Church Army also has a small labor colony, the Newdigate Farm Home. It is really an emigration test farm situated at Holmwood, near Dorking, and consists of 150 acres of heavy clay soil, which when it was purchased by the Church Army in 1899 was practically derelict. The buildings on the estate only afforded accommodation for a manager and his family and about eight men, but a dormitory, dining-room, and

English Colonies

workshop have been built, providing accommodation for a further sixteen men. The land is now in a fair state of cultivation, about fifty acres being under crops, while there are three acres of garden and orchard. During the year 1905, after testing and training, sixty men and youths were emigrated. At the present moment the Church Army is contemplating a very large extension of this colony work, and a valuable estate has already been offered for this purpose.

Libury Hall, at Great Mundon, Herts, is an actual example of the German method in England, with this only in its favor, that the German in England who happens to be out of work is a man of rather better type than the average colonist in Germany. The scheme is to some extent one of repatriation, and many men have been sent back to their fatherland through its instrumentality. Mr. E. D. Court, a local government board inspector, has given an account of this work from which I make the following extract:

The object and working of the colony might be stated thus: The mission of the colony being not to give alms nor money, but to help by affording opportunity to work, the freehold of 300 acres of suitable land in Hertfordshire was purchased. About thirty-five acres of this is occupied by buildings, poultry runs and duck ponds, willow bed, gravel pit, fruit and vegetable garden, and wood; thirty acres by meadow, and the remainder is sown or planted with wheat, rye, barley, oats, potatoes, beans, swedes, turnips, artichokes, clover, rape, mustard, vetches, and sainfoin. A basket-weaving shop on a large scale was erected, with a carpenter's shop and smithy, and large well-ventilated stables, cow-sheds, and piggeries, also small shops for tailor and shoemaker, a bake-house, laundry (now being greatly enlarged), dairy, kitchen, etc. In all these departments, as well as in cleaning the house, work is found, but the great majority of men are employed out of doors, the stronger men in digging gravel, breaking flints, making roads, and so on; the weaker in the garden or looking after the poultry. There are sixteen cart-horses, and about the same number of milch cows, and useful experience has been gained by intending emigrants looking after them. Beds were at first provided for ninety men, sixty-four of them in one large dormitory, divided into sixteen cubicles. Later, to meet the winter pressure, room for twenty more beds was found by cutting off a part of the basket-weaving department, and it is proposed shortly to build for 150 more men. About 860, or more than two thirds of those received, have been distinctly benefited. As to financial position, the colony is not self-supporting so far, and probably never will be. The buildings have involved large expenditure, and the expenses are heavy. For ten weeks' work a man receives not only board and lodging, but, if necessary, clothing, and a sovereign is spent on his return journey to Germany, while he is given tokens to the value of one penny and a half a night during his stay at the colony unless he misbehaves. On the other hand, the average stay is a little under eight weeks, and for the first three weeks, owing to poor condition and so on, not very much work is done. Also there is difficulty in finding a market for some articles.

Turning to Scotland we find one illustration of this type of colony, started partly as a result of "General" Booth's book on "Darkest England." The committee appointed recommended the establishment of a farm colony, and in 1897 the Scottish Labor Colony Association was formed to carry out the objects of the original Labor Centers Board. The farm of Mid Locharwoods, consisting of 490 acres of land excellently situated eight miles south of Dumfries, was purchased, 150 acres being good arable land, and the rest reclaimed or unreclaimed moss land. The moss land lies at one extremity of Lochar Moss, so that there are great possibilities of expansion in the operation of the colony. The peat is used as fuel, and the land reclaimed by liming and claying is capable of growing good crops of turnips, cabbages, carrots, and potatoes. The colonists are chiefly taken from a shelter in Glasgow and are not of the very best type. The colony receives nothing from the poor-law authorities in Scotland, who have no power to make grants for the

able-bodied, however destitute. It is therefore dependent almost entirely on voluntary subscriptions, the loss on each man being four shillings and one penny per head per week. The colony received during the year 1904 about sixty-seven men, and forty of these left with every prospect of doing well.

There are still several other colonies that need a word or two of description. Switzerland possesses two, the one for the Canton of Berne at Tannenhof, the other at Herdern, in the Canton of Thurgau. The former, established in 1889, consists of 160 acres of land, with accommodation for fifty inmates; while Herdern, established in 1895, has now about 250 acres, and can take in nearly 100 colonists. As in Germany, the great pressure comes in winter. A very considerable proportion of the colonists are between forty and sixty, and many of them for this reason alone would be unable to obtain situations, but practically no one is refused who is at all able-bodied

Other Countries

except on the score of previous expulsion for bad behavior. There is a very small wage paid at both colonies, not amounting to more than threepence or fourpence per day, but remuneration is given for the labor of the colonists chiefly in the form of clothing and boots. Nearly 50 per cent find work on leaving the colony or have it found for them by the colony authorities. The finances are furnished partly by contributions from public authorities and partly by private donations and subscriptions. The Swiss colonies make the same mistake as the German in the mixing of the various classes, in respect of which practise Sir C. Green, in his report on the Swiss Labor Colonies, makes this interesting remark: "Moreover, the fact that these colonies admit the criminal element, even with the laudable intention of reforming them and refitting them morally and materially, seems to constitute the most serious obstacle to the adoption of the system as a relief for bona-fide working men, whose only fault, or their worst, consists in their inability to find the means to earn their daily bread."

The French colony of La Chalmelle is situated in the Forêt de Traconne, about fifty miles from Paris, the nearest station being Les Essarts-la-Forêt. The colony was founded in Jan., 1892, at the instance of M. Georges Berry, and consists of about 370 acres of rather poor quality land. Since 1900 it has been possible to accommodate about fifty-five men at a time, admission being granted to those who are recommended by the directors of the night refuges in Paris. Roughly speaking, the colony, which is a municipal institution run by the Council of Paris, costs the City Council on the average about £1,800 a year, about £1,000 being received as a result of the sale of produce and in other ways. A special effort is made by the directors of the refuges through the agency of the colony, to return persons connected with agriculture once more to the soil. Some 74 per cent of those who enter the colony are connected with agriculture, chiefly country laborers who flock to Paris at the end of the harvest and vintage, and in the course of the winter find themselves stranded. The majority are between twenty and forty, so that, both in respect of occupation and of age, La Chalmelle is a much more hopeful experiment. The length of stay in the colony is not long. Out of 820 men, 436 left in less than two months, and an additional 249 in

less than four months, while of those who left 59.9 per cent obtained situations. During the year about 250 workmen come and go and half of these seem to derive very material benefit from their stay at La Chalmelle. Even with the rest much more good might be done if criminals, drunken vagabonds, and the habitués of the night refuges could be excluded or sent to another institution.

III. Colonies for Better Type of the Unemployed

Perhaps the most famous example of the type of colony that helps the unemployed is Fredericksoord, which is situated in Friesland, north-east of the Zuyder-Zee, about nine miles from Steenwyk. It is one of three, the other two being Willemsoord and Wilhelminasoord. These colonies consist of 10,000 acres of heath and sand and are now under cultivation by town-bred men, many of them over forty years of age, who have failed to get work in the town, and have, therefore, been sent out by the Society of Beneficence, which was founded in 1818 by General Van Den Bosch. The colonists are admitted on the recommendation of charitable associations and societies working in the big cities of Holland. Most of them are unskilled laborers, and very few of them have any knowledge of agricultural work. Fredericksoord, the best known of the three, has a population of 1,900, and the work on which colonists are engaged is chiefly agricultural, although it includes dairying, brick-making, mat-making, and basket work.

These three colonies receive married men with their families, as well as unmarried men. At Fredericksoord there are at least 400 families. The new men on arrival at the colony are placed on one of the five large farms, and there given work under skilled superintendence. Provided that their behavior is good they may remain on the colony all their lives, but in certain cases where a man has shown ability to learn the trade of agriculture, after a probation of at least two years, he is given a free farm of about seven acres and a half. As a rule a colonist is not capable of earning his own living until he has been something like two years in the colony, so that two years is the shortest probation possible if a man is to qualify for the position of a free farmer. Sometimes men are in the colony four or five years before they obtain this promotion. At the present moment there are about 150 free farms of from six acres and a quarter to seven acres and a half; the majority of them are in good condition. These holdings are cultivated on what is practically a life tenure. Rent is paid to the colony, which provides stock and seeds and the necessary credit. If the free farmer conducts himself well in the opinion of the director, he can hold his farm until his death, while frequently in such a case the widow is allowed to retain the holding providing that she can cultivate it herself with the aid of the members of her family. In a few cases the daughter of a free farmer who marries the son of a colonist takes over the farm, but there is no legal right to a holding under any circumstances, and a farmer might possibly be expelled without compensation for improvement. It is needless to say that such cases are very few and far between. Besides growing enough food to provide the family a free farmer will have two or three milch sheep and four or five pigs; for the rest the principal produce is

butter and potatoes. Generally speaking, the credit of the farmers is improving, and there are very few bad debts; no interest is charged on loans, but the amount due to the colony by the free farmers is steadily decreasing, being only £1,691 in 1902; the loans advanced in that year only amounted to £47 5s.

Similarly, Willemsoord, which has an area of over 5,000 acres, is doing good work in establishing these small freeholders, nearly all of whom are so occupied on their own piece of land that they have no need to work as agricultural laborers, and are, in fact, entirely self-supporting. At Willemsoord, in addition to the particular trades already mentioned, there is a certain amount of blacksmithing, tailoring, and carpentering. The colony possesses six large farms, upon which the men are taught and trained, a chosen few being drafted off, as at Fredericksoord, on to free farms.

What general conclusions may we draw? It perhaps ought to be pointed out that the colonies are not so well managed as in Germany. There is at present a noticeable lack of enterprise, and new ideas which ought to be readily entertained do not find much favor. The total population of the colonies tends to decrease, a result which may be due either to the increase of employment in the large towns like Amsterdam, Rotterdam, and The Hague, or to the growing disinclination of the unemployed to go to a colony where very few, comparatively speaking, have the chance or the opportunity of becoming independent. One point which militates against the success of the colonies is the age of the average man. If he is over forty and has not succeeded in the town, the chances are that he will not be wholly successful in the country. Then again, the colonies have, perhaps, in their desire to make both ends meet, made a mistake in encouraging the authorities to send paupers on private contracts. The number of such paupers is on the increase, which is very noticeable during the periods of severe depression or hard winter. Financially, the colonies cannot be considered altogether a failure, for if we take it for granted, as the latest figures seem to imply, that each colonist, man, woman, and child, costs the benevolent societies and other charities from £1 10s. to £2 per annum, we must at the same time admit that this is a small sum as compared with the amount that would have been expended on the same people in the town, while the result of their labor has been for their physical and moral good and the enrichment of the land.

In Germany, as long ago as 1886, the idea of Heimat-kolonisten (home colonists) was broached, and at Frederichwilhelmsdorf, near Walsdorf, about three miles from Bremerhaven, twelve colonists were taken on the understanding that it meant permanent settlement if they proved industrious and capable. At the present time there are only four or five colonists permanently settled on farms of their own, but some forty or fifty are in the probation stage working on the farm.

Another and still more successful experiment was made in Dec., 1898, by the Executive Committee of the Town Labor Colony at Hamburg. It acquired an estate of over 900 acres at Schäferhof, in Holstein, and there seems every hope that many men who are at present working there will eventually find permanent settlement. It is perhaps worth while quoting the words of a member of the Colonies Central Board, in a speech delivered on Nov. 1, 1903:

Whereas up till now the colonies have had a constant succession of inmates who, on account of their want of strength and skill, have been hardly able to do as much as one half or one quarter of a man's work, we have in our permanently settled inmates at our home colony at Schäferhof got together a set of workmen who have, so far, done really wonderfully good work. Our home colonists, who now number 100, not only do all the agricultural work on the Schäferhof estate of over 875 acres, but also, even in the first four years, when there were many fewer colonists, they helped us to build a big cow-house to accommodate beasts, a colonists' house with cubicles for sixty men, and a splendid greenhouse, which last, indeed, they built entirely themselves. Besides this they have in the same period put 113 acres of heath and moorland into cultivation, and have macadamized a length of 2,040 yards of field roads, which they carried out in an altogether satisfactory manner, and for which they broke up about 400 cubic yards of stone. In the last two years they have planted out and tended 7,854,500 saplings for other people, and 83,000 oak, fir, apple, and pear-tree saplings for the colony.

The only colony in England which at all approximates to the Schäferhof experiment is that situated at Hollesley Bay, near Woodbridge, in Suffolk. It was offered to the Central Unemployed Committee of London by Mr. Joseph Fels on exactly the same conditions as Sumpner's Farm at Laindon was offered to the Poplar Board of Guardians, and has now been purchased with the consent of the Local Government Board for that committee under the Unemployed Workmen Act. The Hollesley Farm consists of an estate of 1,200 acres, taken over formally and legally by the committee in Feb., 1905. It was originally a colonial college, in which training and instruction in agriculture was given, and in many respects it was very well suited for colony purposes. About 500 out of the 1,300 acres are arable land, and the rest pasture, while a considerable amount is woodland and heath, part of which has already been brought under cultivation. The buildings of the college are in every way suited for this experiment, and twenty-three cottages on the estate will provide accommodation for about 300 men. There are farm-buildings and well-fitted workshops—for example, carpenter's, blacksmith's, and wheelwright's, together with a shoeing forge—and a great deal of expense will thus be avoided, while practically all the repairs that are required in such a colony could be carried out on the spot.

Three special objects are kept in view by the committee for the conduct of the colony:

- (1) The provision of special work for periods of exceptional distress.
- (2) The provision of more continuous work for men who are not only in exceptional need of employment, but who have either already lived upon the land or show a marked aptitude for country life.
- (3) The establishment of suitable men and families in agricultural or other rural industries.

In the case of No. 1, as is quite natural, the work of the selected men who are out of employment during a period of exceptional distress will not be so much agricultural as road-making, reclaiming heath land, strengthening the sea wall, brick-making, and the general repair work of the colony. All this can be done without interfering with ordinary industry.

In the case of Nos. 2 and 3, Hollesley Bay will more closely approximate to the type of colony with which we are dealing at present. Taking class No. 2, it is suggested that there should be two stages—(a) a probationary period of three months, during which the men might live in the colony buildings, their wives and children being supported in London; and (b) a second stage, providing that the period of probation proves the men to have the necessary strength and ability

for agricultural work. In this case it is proposed that the wives and children of the men shall be brought down from London, and that cottages be allotted to these families for a period of from six to nine months. Some cottages have already been built and are in occupation.

Following on this second stage in the treatment of class 2 is the definite establishment of selected men and families in agricultural or other rural industries, and it is hoped that not only may ordinary farm or market gardening situations be found for good men, but that finally some of these men may be established on small holdings in the neighborhood of the colony, and this hope would be held out to all who distinguish themselves by industry and capability. Hollesley Bay will be seen thus, supposing that these plans can be carried out, to offer the most constructive attempt yet made, either in England or on the Continent, to deal with the question of unemployed labor; and providing that the small holdings idea can be carried into effect and gradually developed upon cooperative lines, the experiment ought to result not only in the absorption of a certain class of genuine unemployed men, but also in the quickening up of rural industries.

During this last year emigration and the colony settlement idea has received considerable impetus, as a result of the report issued by Mr. Rider Haggard after a visit as government commissioner to the U. S. Mr. Rider Haggard was instructed by the English Government to investigate agricultural and industrial settlements which have been established by the Salvation Army. These settlements were established with the idea of facilitating the flow of suitable men and women from the great cities of the U. S. to the land, and the commissioner's special object was to ascertain how far an analogous system might be with advantage applied in the emigration of the urban population of the United Kingdom to different parts of the British Empire. It was also suggested that Mr. Haggard, after inspecting the settlements, should report on the possibility of such emigration to Canada, conferring with Earl Grey, the governor-general.

Mr. Haggard's report gives the result of his investigations at the Salvation Army land settlements in Colorado and California, namely, Fort Amity and Fort Romie. On the whole the two experiments seem to Mr. Haggard, who is very optimistic on the subject, to be eminently successful, and to demonstrate in the case of Fort Romie that indigent people of the agricultural laborer class can be settled upon land and there do well, and in the case of Fort Amity that such persons can even be taken from towns and yet prosper. In both cases they are nearly self-supporting, for the nominally there has been a total loss of about £10,000 on the two, Mr. Haggard attributes the loss to certain exceptional difficulties, to the high rate of interest the Salvation Army has to pay, and the charges which should not have been included.

To quote Mr. Haggard's own words:

Broadly stated, these results may be said to include the turning of a block of waste prairie land into a prosperous settlement, where a population of about 270 persons are living in happiness, health, and comfort, with a good prospect of becoming entirely independent and, in sundry instances, comparatively wealthy.

Mr. Haggard suggests that these colonies or settlements might well be established by an arrangement between the British and Canadian

Governments, and he has drawn up a scheme and given a financial estimate whereby land which the Canadian Government is willing to grant, 360 sq. m., or 240,000 acres, should be divided up between 1,500 families, or about 7,500 people. The cost of emigrating and establishing such a number in Canada he puts down roughly at £200 per family, or £300,000 in all, and he suggests that the interest on such a loan should be guaranteed by his Majesty's government, or perhaps by a combination of the two governments. He adds that the municipalities might be empowered to join in the guaranty. For the management of such a vast organization he suggests the appointment of a superintendent of land settlements, or a board representative of the Colonial Office, the Colonies, and the Treasury, whereof the superintendent would be a member. The expenses and salary of his office would be a charge on the land settlements loan.

PERCY ALDEN, M.P.

LABOR COPARTNERSHIP ASSOCIATION,

THE: This association, formerly known as the Labor Association, was founded at Derby, England, in the year 1884. Its object is "to bring about an organization of industry based on the principle of labor copartnership; that is to say, a system in which all those engaged shall share in the profits, capital, control, and responsibility." With this view, it seeks, first, in the cooperative movement to aid by its propaganda and advice all forms of production based on the above principle; and, second, to induce employers and employed in other businesses to adopt schemes of profit-sharing and investment tending in the same direction.

One of the first tasks of the association was to compile statistics of the copartnership societies at work at the end of 1883. It was but a meager showing of fifteen societies and a trade of £160,751, compared with 128 societies in 1906 and a trade of £3,806,156. (See COOPERATION, PRODUCTIVE.) To this growth the association has contributed by a steady propaganda of leaflets, lectures, etc. More recently, however, the association has largely diverted its activities from the formation of cooperative societies toward that of encouraging private firms to practise copartnership. In this direction its most signal success has been with the gas companies; the total amount of 7,138 workers' earnings which were capitalized by five companies reached £368,548 in June, 1906. The (London) South Metropolitan Gas Company bulked largely in the figures, Sir George Livesey being a stout supporter of the copartnership principle. Three of the employees of this company sit on the Board of Directors.

Attention has also been given by the Labor Copartnership Association to the new housing societies. (See HOUSING QUESTION.)

The Cooperative Productive Federation (*Secretary*, Mr. R. Halstead, 17 Marlborough Road, Leicester), advises with regard to trade, opening up markets, and obtaining capital, while the association continues its general propaganda work. *Secretary*, Mr. Henry Vivian, M.P., 6 Bloomsburg Square, London, W. C. HENRY VIVIAN.

LABOR DAY is a holiday in the United States for working men on the first Monday of September, usually celebrated by parades of labor organizations, addresses, picnics, etc. It

was first held in a few states in 1887, and is now a legal holiday in about half the states. In Europe, May 1 is usually celebrated as a labor festival, and has been taken advantage of by Socialists for gigantic demonstrations. In some countries disturbances on this day have caused the governments to forbid its celebration.

Thirty-six states of the union and the District of Columbia make Labor Day a legal holiday. This wide observance gives the celebration almost a national character. A Labor Day was celebrated in New York City in 1882, but not till 1887 was Labor Day made a legal holiday.

LABOR EXCHANGES (*Bourses de Travail*) are buildings or institutions established by the governments (municipal or state) of some countries in Europe, and particularly France and Italy, as headquarters for labor organizations and similar societies. The first Labor Exchange was started in Paris 1887, after some abortive beginnings in 1848 and under the Third Empire. In 1887, however, the *Paris Bourse de Travail* was founded and was given an annual subsidy of 150,000 francs, and an old building in the Rue Jean Jacques Rousseau. In 1892 a fine new building was provided in the Rue Château d'Eau, at a cost of 3,000,000 fr. Lit by electricity, heated and commodious, it became the headquarters of over 200 unions. It became, however, also, to a certain extent, the headquarters for socialistic and sometimes revolutionary movements, and for a while was closed by the government in 1894. Similar labor exchanges have been started in many French cities. From the first they have had Labor Registrars or Employment Bureaus connected with them, and latterly these have become important. (See PUBLIC EMPLOYMENT BUREAUS; BELGIUM; ITALY.)

LABOR LEAGUE, NATIONAL WOMEN'S:

This is a national league established in England in 1906, to work for labor representation in connection with the Labor Party.

The purpose of the league is large, for the members engage to take an active interest in all better work. *Address:* 34 St. Thomas's Mansions Westminster Bridge, London, S. W.

LABOR PARTY, THE: The name adopted in England, in 1906, by the LABOR REPRESENTATION COMMITTEE (which see) after its phenomenal success in the parliamentary election of Jan., 1906.

The Labor Party is a federation consisting of trade-unions, trades councils, Socialist societies, and local labor associations. A local labor association in any constituency is eligible for affiliation provided that the local trades council has been consulted in the first instance. Cooperative societies are also eligible. Its object is declared to be to organize and maintain a parliamentary Labor Party, with its own whips and policy; and to secure the election of candidates for whose candidatures an affiliated society has made itself financially responsible and who have been selected by a regularly convened conference in the constituency. All such candidates shall pledge themselves to accept this constitution, to abide by the decisions of the group, and to appear before their constituencies under the title of Labor candidates only.

The affairs of the committee of the Labor Party are transacted by an executive committee of thirteen members, of whom nine represent the trade-

unions, one the trades councils, and three the Socialist societies.

A parliamentary fund is raised in order to assist the main objects. This fund is maintained by a levy upon the affiliated societies at the rate of two pence per member per annum. According to the present arrangements the Labor Party pays 25 per cent of the election expenses of its candidates, and £200 per annum to such candidates elected to Parliament.

The seventh annual conference of the Labor Party was held in Belfast in January, 1907, under the presidency of J. J. Stephenson, and there were 347 delegates in attendance. The membership was reported at 998,538, an increase of 77,000 over the previous year. The parliamentary fund had received £5,000 in subscriptions, and £7,177 had been paid out. The net balance in hand was £4,793.

The party is practically, tho not technically, a Socialist party, and at least twenty of its representatives in Parliament are avowed Socialists, while all its other members favor most Socialist measures. The measures indorsed at the congresses include: An adult suffrage measure; national measures for dealing with unemployment; taxation of unearned increment; secular education and free meals for children; minimum wage of thirty shillings for government employees; compulsory early closing and abolition of "living in" for shop assistants; local veto on liquor traffic, and prohibition of publication of betting news.

Of the fifty Labor members in Parliament, thirty were indorsed by the Labor Representation Committee, thirteen were miners' candidates, and seven were other trade-union candidates. Of the thirty indorsed by the Labor Representation Committee, four were nominated by the Independent Labor Party only, thirteen by the Independent Labor Party and trade-unions, twelve by trade-unions only, and one by the Social Democratic Federation and a trade-union.

In February, 1906, J. Keir Hardie was elected Parliamentary Chairman of the Labor Party. It is estimated that the total Labor Party vote in 1906 was 350,643; not including the votes for Labor or other candidates unaffiliated with the Labor Party. The *Chairman* of the Labor Party executive is Walter Hudson, M.P.; its *Secretary*, J. Ramsay MacDonald, M.P., 28 Victoria Street, Westminster, London, S. W.

LABOR REPRESENTATION COMMITTEE (now the English Labor Party): A political committee first formed in Great Britain, in 1900, by representatives of various trade-union bodies and Socialist societies, to indorse and support the candidates nominated by its constituent unions and societies.

The committee originated in a resolution adopted by the Trade-Union Congress at Plymouth, in 1899, to summon "a conference of trade-union, cooperative, socialistic, and other working-class organizations," to consider labor political representation. This conference was held Feb. 20-28, 1900, in London, attended by 129 delegates, representing societies with a membership of 568,177, of which 22,861 were Socialists and the balance trade-unionists. A Labor Representation Committee was formed with practical unanimity and has met with great success. Annual conferences have been held since, at Manchester (1901), Birmingham (1902), Newcastle-

on-Tyne (1903), Bradford (1904), Liverpool (1905), London (1906). At this last congress it was voted to adopt the name The Labor Party.

Mr. J. RAMSAY MACDONALD has been secretary of the committee from the beginning. The general election of 1900 was held before the committee was well under way, but fifteen candidates were indorsed by it and two were returned to Parliament, Richard Bell at Derby, and Keir Hardie at Merthyr Tydvil. In Aug., 1902, D. J. Shackleton was returned at a by-election in Lancashire practically unopposed. In 1903 William Crooks and A. Henderson were elected to Parliament at by-elections in Woolwich and Barnard Castle. Forty seats were also won in municipal contests. In 1904 the committee commenced paying its representatives in Parliament £200 each, raised by a penny levy on its 969,800 members. One by-election was won, and another in 1905, but both members died. In the general election of Jan., 1906, the committee indorsed fifty-three candidates and elected thirty members to Parliament, estimated to represent 331 votes. Besides these, twenty others, nominated by trade-union bodies, were elected, making a Labor group of fifty members, independent of other parties and not including fourteen other Labor members, like John Burns, W. R. Crewel, and others affiliated with the Liberal Party, and still a few other Fabian Socialists or Independents affiliated with the Liberal Party, but voting with the Labor group on many labor measures. It was this success that made the Labor Representation Committee at its 1906 congress vote to call itself The Labor Party. In 1900 the committee represented societies with 375,931 members; in 1906 the 231 societies and unions represented in the committee had 921,280 members. (See LABOR PARTY.)

LAFARGUE, PAUL: Socialist; born at Santiago, Cuba, 1842. Studying medicine in Paris, he took part in the Commune of 1871, and then fled to Spain and England, where he married a daughter of Karl Marx. In 1880, with Guesde (q. v.), he organized Marxist socialism in France, since which date Socialism of this type has steadily grown in France. (See FRANCE AND SOCIAL REFORM.) Lafargue was imprisoned in 1883 and again in 1891, but was liberated on being elected to the Assembly from Lille, tho in the next election defeated. Author: "Le Matérialisme économique de Karl Marx" (1884); "Le Droit à la Paresse" (1887); "The Evolution of Property" (1891); "Le Socialisme utopique" (1892); "Cours d'économie sociale" (1884); "Le Communisme et l'Evolution économique" (1892); "Le Socialisme et la Conquête des Pouvoirs publics" (1899).

"LAISSEZ-FAIRE": The watchword of the classical individualistic political economy of Adam Smith and his school, tho it is said to have been used by a French merchant, Legendre, as early as 1680, in answer to a question by Colbert as to what should be done for industry. By 1735 the Marquis of Argenson said that *Laissez-Faire* should be the watchword of every government. (See INDIVIDUALISM; PHYSIOCRATS; SMITH, ADAM; POLITICAL ECONOMY.)

LAMENNAIS, HUGUES FÉLICITÉ ROBERT, ABBÉ DE: French reformer; born 1782 at St. Malo, France. At first skeptical, the materialism of France drove him to the Church, and he re-

ceived the tonsure in 1811, and the priesthood in 1817, becoming a teacher at St. Malo. Supporting monarchy, he attacked Napoleon, and was compelled to flee to England. Returning to France, he published his "Essai sur l'Indifférence en Matière de Religion," 4 vols., 1817-20, and other works. In 1830 he founded the journal *L'Avenir*, with the motto, "God and liberty, the Pope and the people." He found many disciples, among them Lacordaire and Montalembert. Denounced at Rome, in 1831 he went to Rome and waited seven months in vain for an audience with the Pope. His faith shaken by what he saw, he hovered between Romanism and democracy. In 1832 a papal encyclical indirectly condemned *L'Avenir*, and drove Lamennais from the Church. After living for a while in silence, he startled the world in 1834 by his burning "Les paroles d'un croyant" (The Words of a Believer). In this he declares Christianity to be love and service, and the French Church to be opposed to this. The Pope condemned this, and Lamennais answered in his "Affaire de Rome" (1836). In his "Le Livre du Peuple" (1837); "Esquisse d'une Philosophie" (1841-43); "De la Religion" (1841); "Du Passé et de l'Avenir du Peuple" (1842), he appeared as "the prophet of democracy," and of the alliance of Christianity and socialism. In 1839 he published a pamphlet, for which he was imprisoned twelve months. In 1848 he was elected to the Constituent Assembly, but after the *coup d'état* withdrew from public life and died in 1854, rejecting to the last all overtures of the Church, and was buried, in accordance with his will, in a nameless grave at Père la Chaise. His passionate belief was that religion is the root of all true progress in all aspects of life—in manners, politics, art, science, philosophy. He, like Mazzini, laid emphasis upon duties rather than rights. He asks why it is that the people have not conquered their rights and held them fast, seeing that the privileged classes are so inferior in numbers; and the reason he assigns is that while the people have in their hands that which overthrows, they have not had in their hearts that which builds up. "Do good," he writes, "by good means. Do not confound the strength wielded by justice and charity with the brute force of ferocity and violence. When fraternity shall be in the hearts of the people, it will not be long before it finds its way into their laws."

LAMPÉRIÈRE, ANNA M. J.: Formerly director of the École Normale, Paris; delegate to a number of congresses which aim at social betterment. She was born Nov. 19, 1854, at Lisieux, Calvados, Normandy, France, and early became interested in social and educational problems. In 1879 she was appointed director of the École Normale—the youngest appointee ever receiving that honor. She was a delegate to the "Congress of Social and Moral Reforms" at Chicago, 1893, being especially commissioned to investigate the "sweating system." Mme. Lampérière is still actively engaged in promoting the work of the "Groupe d'Initiative pour l'Éducation Sociale," and is particularly interested in the section for the social education of women. The articles which have come from her pen indicate sufficiently the line of her literary and practical work: "Le Patronage scolaire" (1894); "L'Éducation Sociale de la Femme" (1896); "Fondation du Progrès Féminin" (1897), all in the *Temps*. She was actively engaged both with her pen and as a dele-

gate to the educational departments at the Expositions in Paris, 1900, and in St. Louis, 1903. She believes that woman is destined to take a higher place in society than she has in the past; for this purpose education along purely intellectual and general social lines is necessary, since her interests are identical with those of an advanced and enlightened society. Mme. Lampérière is the author of "Le Rôle Sociale de la Femme" (1898); Report to the Minister of Education in 1900 and 1903; and has in preparation "L'Éducation Sociale de la Femme." Address: Mme. Anna M. J. Lampérière, 46 rue de St. André-des-Arts, Paris, or "Cottage bleu," Lisieux, Calvados, France.

LAND: We consider in this article (1) the history of land tenure, in the development of modern conditions, a subject of large importance as it shows how comparatively modern is the present institution of private property in land, and how largely modern titles are based, not on justice or equity, but on robbery, extortion, and violence. (2) We notice the existing facts as to land ownership; (3) the economic and moral results of this ownership; (4) the various propositions for land reform; (5) the arguments for and against the private ownership of land.

(For fuller consideration of subsidiary points in the history of the past and the facts of the present, see PRIMITIVE PROPERTY; MARK; MANOR; MIR; COMMUNISM; FEUDALISM; MIDDLE AGES; MEYER; AGRICULTURE; FARMERS' MOVEMENT; SLUMS; TENEMENTS; MORTGAGES; WEALTH. For a discussion of the economic principles entering into the land question, see RENT; WAGES. For fuller development of the various proposals for reform on the land questions, see ANARCHISM; COMMUNISM; COOPERATIVE FARMING; LABOR COLONIES; SINGLE TAX; SOCIALISM.)

I. The Development of Modern Conditions

Land at the beginning of human history was wholly unappropriated. Each man helped himself to what he would and what he could. The world was a No Man's Land. But the preservation of life compelled the weak to seek protection by placing themselves under some strong leader. Leaders were glad to protect those who would slave for them; the rearing of the young compelled some sort of a more or less permanent habitation and defense from attack of man and of beast. Consciousness of kin and of kind drew men together; gradually property arose. Then land became appropriated, but under what forms is a matter of debate. One school of thought—led notably by Laveleye (q. v.)—has found in the forms of modern savage life, in the remnants and traditions of the Russian *mir*, the Javan *dessa*, the Indian communal village, the Slavic communal families, the German *mark*, the Swiss *allmend*, the English *manor*, the Greek and Roman public feasts, the family communities of various out-of-the-way sections of Western Europe, evidence of a primitive communal holding of land, where little groups of men and women, perhaps patriarchal families, appropriated land collectively and tilled it for the common good. This view has been sharply criticized, notably by Fustel de Coulanges (q. v.). It is argued that the evidence does not prove a primitive communism but rather a primitive slavery, land being held, perhaps by tribes, but not by communal tribes; rather by despots, tyrants, bullies, who, with the aid of their minions, would seize and defend and till certain portions of the soil. Perhaps the true view is midway between these two extremes. The horde or the patriarchal family (q. v.) was undoubtedly the first unit that owned land; but this was probably anything but a democratic unit or a communal colony. Slave labor, the wife or wives perhaps being the first slaves, undoubtedly first tilled the soil in large and permanent ways. Babylon, Egypt, Persia, rested on slave labor, tolling for lords of the soil, who in turn followed despotic kings defended by slave armies. Out of this condition in Japan, China, and through Asia generally, a serfdom gradually developed, following in a rude way the feudal forms we best study in Europe. Japan only very recently has thrown off feudalism. Outside of civilized countries the land is yet held to-day by savage tribes, by

Primitive Property

feudal lords or by men under despots, as in Mohammedan countries, despised and tyrannized cultivators of the soil.

It is in Greece and Rome that we find the real beginnings of individual ownership of land. In Greece, the city-State was supreme. It conquered the land and parceled out the territory among the free citizens, the assignments being tilled by slaves.

Greece and Rome

Mines and some lands were held by the State, however, and worked for the State by slaves. Rome began in the same way. Two *jugera* (one acre and a quarter) were originally assigned to each household. Households were combined in *gentes* and the *gentes* in the State. The State, however, held some land, and perhaps rented some of it.

But by the time of Servius Tullius the original private portion of many households must have been greatly but unequally enlarged, for his new military organization was based on the obligation of service imposed on the freeholders (*assidui*) as distinguished from the mere laborers and breeders of children (*proletarii*).

Class distinctions based on landownership thus early began. The wealthy had their lands tilled by slaves. The poor landowners, unable to sustain themselves, hired themselves as laborers or sold themselves or their children into slavery. Finally the poorer citizens rebelled; they assembled on the Mons Sacer and threatened Rome. It was the commencement of the long struggle over agrarian laws.

The object of these laws is well illustrated in the Licinian law (387 A.U.C.). It enacted that no citizen should hold more than 500 *jugera* of the public lands; that no one should graze more than 100 oxen and 500 sheep on the common lands; and that every landowner should be obliged to employ a number of free laborers proportioned to that of his slaves.

Such laws pacified the people for the time, but had little permanent effect.

Successful wars gave a temporary outlet to labor in the formation of agricultural colonies, but at the same time immensely increased the number of slaves, who were treated as mere beasts of toil, to be worked out or sold off when no longer profitable.

Great estates tilled by slaves grew. The Gracchi demanded a distribution of the State lands among the people, but the demand was stifled in blood. Later, Julius Caesar to an extent yielded; but it was too late. Great estates created an aristocracy. The Roman Empire grew corrupt with a few great owners of the soil in power and luxury, and the mass of the people enslaved and poor. Pliny's famous utterance sums it up: "*Latifundia perdidit Italiam*" ("Natural History," 18. 6. 7. §35. "Great estates overthrew Italy"). Then the Goth came.

The exact connection between the Roman system and feudalism is not fully clear. The origins of feudalism itself are disputed (see FEUDALISM); but the great Roman villas, tilled by poor freedmen dependent on their lords, as well as by slaves, undoubtedly contributed at least somewhat to feudalism. Gradually under feudalism, and partly due to the Christian Church (see CHRISTIANITY AND SOCIAL REFORM), chattel slavery disappeared in Europe, but the slaves and poor freedmen became serfs of the soil, entitled to some rights, but tied to the villa or manor, and compelled to render service to the lord of the soil. The *mark* (q. v.) had been previously the typical organization in German land tenure. It is disputed just how it was organized, but it was undoubtedly in general a tribal organization. Cicero says ("De Bell. Gall.," vi.) of the Germans of his time:

No one has a fixed quantity of land or boundaries of his property, but the magistrates and chiefs every year assign to the communities and families who live together as much land and in such spots as they think suitable, and require them in the following year to remove to another allotment.

Tacitus describes it later in the same general way. Perhaps out of this organization, blending with the Roman system, came feudalism. As the Carolingian Empire arose and then dissolved, the various kings would assign different portions of their kingdom to the great barons to rule over and defend. They, in their turn, would similarly subdivide their territories, and this would produce feudalism. The system seems to have first arisen in Germany; but in England it is best studied, particularly in tracing its development into modern conditions, because in Germany various sys-

tems, as we shall see, existed side by side, while in England the development is clearer.

Alfred Russel Wallace ("Land Nationalization," pp. 22-25) has summed up in a few lines the essence of feudalism as far as land tenure is concerned, and its development into modern English landlordism. He says:

The actual system of land tenure and all existing rights of property in land in this country may be said to have originated at the Norman Conquest, when the whole land of the kingdom became vested in the crown. All the great landed estates were then granted as fiefs by the sovereign; and their holders were obliged to render military and other service proportionate to the extent and population of their lands. These estates were also subject to various fines, on marriage or on transmission to an heir; they were not allowed to be sold or alienated without the permission of the sovereign; and on the death of the owner without heirs the whole reverted to the crown. Any breach of fealty or the commission of any act of felony also entailed the loss of the estate. The great vassals were usually endowed with civil and criminal jurisdiction over the inhabitants of their estates, and were altogether more in the position of subordinate rulers than mere landlords in the modern sense of the term.

Feudalism

These immediate vassals of the crown again granted lands in fief, on various payments or services, and in process of time these fiefs were allowed to be divided or sold, and the payment or service to be commuted for fixed sums of money.

The "lords of the soil" were the chiefs and protectors of the community which lived on their estates, while every individual, down to the villen and serf, possessed definite rights and privileges in connection with the land, which, tho they might be infringed by force or rapine, were fully recognized by custom and law.

But as time rolled on this system became modified in a variety of ways, the always for the benefit of the lord, and to the injury of the inferior landholder. As the king obtained more power and the attractions of court life became greater, the nobles and great landowners came to look upon their estates chiefly as sources of revenue to be spent in the capital or in foreign lands. The employment of foreign mercenaries and the rise of standing armies enabled the king to dispense with the military service of his vassals, and by self-made laws this and other burdens on the land were gradually thrown off, and were replaced to a great extent by taxes on the mercantile and landless classes. The ingenuity of lawyers and direct landlord legislation steadily increased the powers of great landowners and encroached upon the rights of the people, till at length the monstrous doctrine arose that a landless Englishman has no right whatever to the enjoyment even of the unenclosed commons and heaths and the mountain and forest wastes of his native country, but is everywhere, in the eye of the law, a trespasser whenever he ventures off a public road or pathway. The lord of the manor is said to be the "owner of the soil," and the surrounding freeholders and copyholders have certain rights of pasture, fern or turf cutting; but the dwellers in the adjacent towns and villages, and all who are mere Englishmen, have no rights whatever, so that if the two former classes agree, the common can be (as hundreds of commons have been) enclosed, and divided among them. It has thus come to pass that at the present day the owners of land, whether acquired by inheritance or purchase, treat it solely as so much property to be made the most of, quite irrespective of any rights of the people who live upon it. They now claim a power which no government, however despotic, has ever openly claimed—that of treating the land exclusively as a source of personal wealth, to which they have an indefeasible right, even at the sacrifice of all that the people who live upon the land hold most dear.

But even this does not bring out the whole situation. When the custom grew up of the baron's making a money payment to the king in place of service, it involved more than first appears. It enabled the king to hire a *standing army* rather than depend upon turbulent barons. The barons preferred it because they in turn could get money in place of service from their dependents, and so could live where they would, *escaping duties, tho maintaining income*. But this was not all. The king, wanting more money, some one suggested that he get money not only from the barons, but from their dependents. It was overlooked or ignored that the dependents were already paying the king *through the barons*, and that the barons were only entitled to payment from their dependents *as representatives of the king*. The dependents thus found themselves called upon to pay

both the king and the barons. Even this was not all. When the barons found their dependents paying the king, they said: "This money is the king's; what money comes to us is ours." The king's payment they called *tax*; their payment they called *rent*—in other words, they set up the claim to own as properties, from which they could collect rent, the lands they had been given to rule over for the king. In substantially such a process, tho disguised, often unconscious to the barons themselves, lies the genesis of the landownership of modern England.

Nor is even this all. Wars in the Middle Ages were fought by the nobility. Gradually the barons grew impoverished and needed money. The development of the Flemish wool market gave them an opportunity. Claiming to own the land, they began to enclose the commons, to evict the peasantry, and turn the land into sheepwalks.

Eden, in his "History of the Poor," gives a quotation from "A Compendious or Brief Examination of Certain Complaints," published in 1581, which says, "these sheep is the cause of all these mischiefs, for they have driven husbandry out of the country, by the which was increased before all kinds of victuals, and now altogether sheep, sheep, sheep."

The landless class was also swollen by the evicted monks and nuns from the monasteries suppress by Henry VIII. How many of these there were can be seen when it is remembered that good authority estimates one third of the whole of England at this time to have been Church land.

Nor is the enclosure of commons by any means a practise of the past alone. It ended in that form, but later took the form of reclaiming waste land. Under the Georges, enclosure became a settled policy. Some 2,000 enclosure bills were passed before the General Enclosure Act of 1801, and about 2,000 more before the Act of 1845. Lawrence's "New System of Agriculture," published in 1726, states that "it is believed that one half part of the kingdom are commons, and a third of all of the kingdom is what we call common fields." In 1879 only 264,000 acres were common out of 32,597,398 acres.

Says S. W. Thackeray ("The Land and the Community," p. 47):

The annual report of the Enclosure Commissioners for 1867 shows that during the 150 years previous no less than 7,660,413 acres were added to the cultivated area; that is, about one third of the total of 25,451,626 acres in cultivation in that year. The commissioners remark that such enclosures, being often made without any compensation to the smaller commoners, have deprived agricultural laborers of smaller rights over the waste, and disabled the occupants of new cottages from acquiring new rights.

Nor must it be supposed that the number of landed proprietors was in any way increased by this process of enclosure. The area enclosed was divided among those, and those only, who already possess common rights by virtue of their holding freeholds or copyholds, and the very idea of recognizing in law any public interest in open wastes or forests is entirely modern. The lion's share was always reserved for the lord of the manor, and immense accessions of territory were thus secured by powerful landowners in days when the landed interest was paramount in the legislature no less than in local administration. The chief sufferers at the time were poor laborers, holding cottages at will of their landlords, who lost the privilege of turning out pigs, geese, and fowls on the common, and for whom, of course, no compensation was provided, or even thought of.

Such is the way that English land property has been developed by encroachments on the rights of the people. Not even yet does the *law* recognize full private property in English land, but in practise it is only too real.

Sir Frederick Pollock says in "English Land Laws":

It is commonly supposed that land belongs to its owner in the same sense as money or a watch; this is not the theory of English law since the Norman Conquest, nor has it been so in its full significance at any time. No absolute ownership of land is recognized by our law books, except in the crown. All lands are supposed to be held immediately or mediately of the crown, tho no rent or services may be payable and no grant from the crown on record.

Williams says ("Real Property"):

The first thing the student has to do is to get rid of the idea of absolute ownership (of land). Such an idea is quite unknown to the English law. No man is in law the absolute owner of lands (p. 16).

All landowners are merely tenants in the eye of the law (p. 55).

Says Mr. Thackeray:

The first sign of an awakening of the public mind to a consciousness of the true meaning of what was going on was in 1836, when in an enclosure act of that year it was stipulated that no enclosures should be made within ten miles of London or within corresponding distances of smaller towns. Next, in 1845, when the General Enclosure Act was passed, which applied to all "common lands," it was enacted that manorial wastes must not be enclosed without the previous sanction of Parliament. In 1852 a later act made the consent of Parliament necessary in all cases under the Enclosure Act.

The development of land property in other countries, so far as it differs from the English development, we consider in speaking of each country. The English theory has been copied in the main in the United States and Australasia. Wherever Englishmen have discovered land they have claimed it for the crown, and the crown has assigned it for the most part in fee simple to companies or to individual proprietors. In English colonies all land is held from the crown. Titles in the older states of the U. S. originated in this way. William Penn purchased land from the Indians, but it was assigned to proprietors by the crown, and Pennsylvania became a proprietary colony. In most of the colonies charters were given to companies, and these companies gave land to individuals. Since the Revolution the federal government has been the owner of all land not already owned by individuals, but has sold it to settlers, under the Homestead Act, for a song, or has given it to towns, states, or railroads.

II. Existing Conditions of Landownership

In the U. S., according to the census of 1900, only 64.4 per cent of the families owned homes, and only 31.8 per cent or less than one third of the families owned un-mortgaged homes. In the great cities conditions are much worse. The following tables from the census give the facts:

OWNERSHIP OF HOMES

| STATE OR TERRITORY | PER CENT OF FAMILIES HAVING HOMES | | | | PER CENT OF FARM FAMILIES HAVING HOMES | | | |
|----------------------|-----------------------------------|------|-----------|-------|--|------|-----------|-------|
| | Owned | | | | Owned | | | |
| | Total | Free | Mortgaged | Hired | Total | Free | Mortgaged | Hired |
| United States..... | 46.5 | 31.8 | 14.7 | 53.5 | 64.4 | 44.4 | 20.0 | 35.6 |
| N. Atlantic div..... | 38.0 | 22.3 | 15.7 | 62.0 | 78.2 | 48.2 | 30.0 | 21.8 |
| S. Atlantic div..... | 40.7 | 33.2 | 7.5 | 59.3 | 55.2 | 45.9 | 9.3 | 44.8 |
| N. Central div..... | 55.7 | 35.3 | 20.4 | 44.3 | 72.3 | 42.2 | 30.1 | 27.7 |
| S. Central div..... | 43.4 | 36.1 | 7.3 | 56.6 | 51.2 | 32.3 | 8.9 | 48.8 |
| Western div..... | 53.4 | 49.7 | 10.7 | 46.6 | 81.0 | 63.4 | 17.6 | 19.0 |

OWNERSHIP OF HOMES, 1890 AND 1900

| KIND OF FAMILY | Number of families | PER CENT OF FAMILIES HAVING HOMES— | | | |
|---------------------|--------------------|------------------------------------|------|------------|-------|
| | | Owned | | | Hired |
| | | Total | Free | Mort-gaged | |
| 1900 | | | | | |
| All families..... | 16,187,715 | 46.5 | 31.8 | 14.7 | 53.5 |
| Farm families..... | 5,698,901 | 64.4 | 44.4 | 30.0 | 35.6 |
| Other families..... | 10,488,814 | 36.3 | 23.4 | 12.9 | 63.7 |
| 1890 | | | | | |
| All families..... | 12,690,152 | 47.8 | 34.4 | 13.4 | 52.2 |
| Farm families..... | 4,767,179 | 65.9 | 47.3 | 18.6 | 34.1 |
| Other families..... | 7,922,973 | 36.9 | 26.7 | 10.2 | 63.1 |

| RACE OR AGE OF HEAD | PER CENT OF PRIVATE FARM FAMILIES HAVING HOMES | | | | PER CENT OF OTHER PRIVATE FAMILIES HAVING HOMES | | | |
|---------------------|--|------|------------|-------|---|------|------------|-------|
| | Owned | | | Hired | Owned | | | Hired |
| | Total | Free | Mort-gaged | | Total | Free | Mort-gaged | |
| Total..... | 64.4 | 44.4 | 20.0 | 35.6 | 36.5 | 24.8 | 11.7 | 63.5 |
| White..... | 70.3 | 48.2 | 22.1 | 29.7 | 38.3 | 25.8 | 12.5 | 61.7 |
| Negro..... | 25.3 | 18.3 | 7.0 | 74.7 | 19.0 | 14.5 | 4.5 | 81.0 |
| Indian..... | 95.6 | 90.2 | 5.4 | 4.4 | 86.0 | 0.6 | 13.4 | 13.4 |
| Mongolian..... | 8.8 | 6.3 | 2.5 | 91.2 | 8.5 | 8.0 | 0.5 | 91.5 |
| White— | | | | | | | | |
| Native..... | 68.2 | 48.1 | 20.1 | 31.8 | 39.1 | 27.0 | 12.1 | 60.9 |
| Foreign-b'n..... | 81.2 | 48.4 | 32.8 | 18.8 | 36.7 | 23.5 | 13.2 | 63.3 |
| Total.... | 64.4 | 44.4 | 20.0 | 35.6 | 36.5 | 24.8 | 11.7 | 63.5 |

In 1900 only 46.7 per cent of "private families," or less than one half of the families of our country, owned their own homes; only 32 per cent, less than one third, owned un-mortgaged homes. From 1890 to 1900 the number of families owning their own homes fell from 47.8 to 46.5 per cent; mortgaged homes increased from 13.4 to 14.7 per cent. Of farm families, in 1900, 64.4 per cent owned a home and only 44 per cent an un-mortgaged home. (For cities, see CITIES.) From 1890 to 1900 the number of farm tenants increased from 34.1 per cent to 35.6 per cent.

| STATE OR TERRITORY | PER CENT OF FARMS OPERATED BY— | | | | | |
|------------------------------|--------------------------------|------|--------------|------|---------------|------|
| | Owners | | Cash tenants | | Share tenants | |
| | 1900 | 1880 | 1900 | 1880 | 1900 | 1880 |
| United States..... | 64.7 | 74.5 | 13.1 | 8.0 | 22.2 | 17.5 |
| Continental U. S..... | 64.7 | 74.5 | 13.1 | 8.0 | 22.2 | 17.5 |
| North Atlantic Division..... | 79.2 | 84.0 | 9.8 | 7.0 | 11.0 | 9.0 |
| South Atlantic Division..... | 55.8 | 63.9 | 17.9 | 11.6 | 26.3 | 24.5 |
| North Central Division..... | 72.3 | 79.5 | 9.5 | 5.2 | 18.4 | 15.3 |
| South Central Division..... | 51.4 | 63.8 | 17.3 | 11.8 | 31.3 | 24.4 |
| Western Division..... | 83.4 | 86.0 | 7.7 | 5.5 | 8.9 | 8.5 |

Thus from 1880 to 1900 the percentage of farms operated by owners fell from 74.5 per cent to 64.7 per cent; farms operated by cash tenants increased from 8 per cent to 13.1 per cent, and farms operated by share tenants from 17.5 per cent to 22.2 per cent.

AVERAGE NUMBER OF ACRES PER FARM

| GEOGRAPHIC DIVISIONS | 1900 | 1890 | 1880 | 1870 | 1860 | 1850 |
|--------------------------------------|---------|-------|-------|-------|-------|-------|
| The United States | 146.6 | 136.5 | 133.7 | 153.3 | 199.2 | 202.6 |
| North Atlantic..... | 96.5 | 95.3 | 97.7 | 104.3 | 108.1 | 112.6 |

| South Central..... | 155.4 | 144.0 | 150.6 | 194.4 | 321.3 | 291.0 |
| Western..... | 386.1 | 324.1 | 312.9 | 336.4 | 366.9 | 694.9 |
| Alaska and Hawaii ¹ | 1,142.1 | | | | | |

¹ No report prior to 1900.

Of this table the Census says:

For the U. S. the average size of farms decreased from 1850 until 1880, since which year it has steadily increased. . . . The increase or decrease in the average size of farms, therefore, is due to the changes incident to the adjustment of the agricultural operations of each locality to those branches of husbandry to which it is best adapted (dairy, vegetable farms, etc.). It may be said that the average area of farms tends to approximate the area from which the farmer possessing average capital can secure the largest returns.

PER CENT OF FARMS BY AREAS

| CENSUS Year | Under 10 | 10 and under 20 | 20 and under 50 | 50 and under 100 | 100 and under 500 | 500 and under 1,000 | 1,000 and over |
|-------------|----------|-----------------|-----------------|------------------|-------------------|---------------------|----------------|
| 1900.. | 4.7 | 7.1 | 21.9 | 23.8 | 39.9 | 1.8 | 0.8 |
| 1890.. | 3.3 | 5.8 | 19.8 | 24.6 | 44.0 | 1.8 | 0.7 |
| 1880.. | 3.5 | 6.3 | 19.5 | 25.8 | 42.3 | 1.9 | 0.7 |

The Census says:

During the twenty years from 1880 to 1900, the number of farms for the entire country increased in every group. The greatest absolute increase was in the group of farms containing 100 and less than 500 acres, which was from 1,695,983 to 2,390,424, a gain of 594,441, or 35.0 per cent. The next largest gain was in the group containing over 20 and less than 50 acres, which showed an increase from 781,574 to 1,257,785, a gain of 476,211, or 60.9 per cent. In the group with 50 to 100 acres the increase was from 1,032,810 to 1,366,167, a gain of 333,357, or 32.3 per cent.

The number of farms containing between 20 and 50 acres decreased in the North Atlantic Division, but increased in all the others, the greatest gains being in the South Atlantic and South Central States.

The Western States showed the greatest increase of any division in the number of farms containing from ten to twenty acres, which, like that in the next larger group, is incidental to the growth of irrigation. No other division reported any noteworthy change in the relative number of farms of this area.

All of the geographic divisions recorded an increased number of farms containing less than ten acres, due in part to the inclusion of small dairy farms, poultry farms, florists' establishments, and similar farms of small size not included in previous census reports, and in part to an actual increase in the number of small farms.

Very large holdings of land certainly exist in the U. S. The number of large "gentlemen's estates" is notoriously on the increase. Foreigners own large sections of land. The Texas Land Syndicate, in which the Duke of Rutland and Lord Beresford are largely interested, is said to own 3,000,000 acres in Texas. The British Land Company owns 300,000 acres in Kansas. Sir Edward Reed is said to own 1,000,000 acres in Florida, and Lady Gordon and the Marquis of Dalhousie 2,000,000 acres. It is estimated that at least 150,000,000 acres of the public domain have been stolen by large land syndicates,

or thirty states of the size of Massachusetts. Yet towards 50,000,000 people own no home at all.

GREAT BRITAIN

Land in Great Britain is probably in fewer hands than in any other country. It has been said that 710 men own one quarter of England, that seventy men own one half of Scotland, and that 13,000 men, or little more than one thirtieth of 1 per cent of the population, own two thirds of the whole United Kingdom. It was also stated that during the Victorian reign 1,225,000 persons died of starvation, 3,668,000 persons were evicted by landlords, and that from 1870-90, 1,000,000 acres of land had gone out of cultivation. In 1688 England was a nation of small properties, three fifths of the agriculturists owning land. Three centuries later scarcely one fifth own any land. In 1895 over 84 per cent of the 520,106 holdings in Great Britain were rented by the occupiers, less than 12 per cent were owned by the occupiers, and the balance were partly rented and partly owned. The following tables give the facts for 1895:

NUMBER OF AGRICULTURAL HOLDINGS

| Classification | Eng-land | Wales | Scot-land | Great Britain | Per cent of holdings Great Britain | Per cent of acreage Great Britain |
|------------------|----------|--------|-----------|---------------|------------------------------------|-----------------------------------|
| Not above 1 acre | 87,055 | 10,763 | 20,150 | 117,968 | 22.68 | 1.13 |
| 1 to 5 acres | 108,115 | 18,569 | 23,104 | 149,818 | 28.80 | 5.12 |
| 5 to 20 | 62,446 | 12,400 | 10,817 | 85,663 | 16.47 | 8.79 |
| 20 to 50 | 46,574 | 10,317 | 9,834 | 66,725 | 12.81 | 15.00 |
| 50 to 100 | 60,381 | 7,896 | 12,968 | 81,245 | 15.62 | 42.59 |
| 100 to 300 | 11,112 | 386 | 2,070 | 13,568 | 2.61 | 15.70 |
| 300 to 500 | 3,942 | 54 | 620 | 4,616 | 0.89 | 9.21 |

Of modern landlordism in Great Britain Mr. Alfred Russel Wallace, the eminent scientist, writes ("Land Nationalization," ch. v.):

In England pure landlordism is seen at its best. Its characteristics have been determined by the great and popular class of country squires and by numerous wealthy peers owning large ancestral estates, who have usually lived among their tenants, have been accustomed to treat them liberally, and have had sympathy with their pursuits and a desire for their prosperity.

Yet here landlords have been known to evict a whole village, to evict all who did not belong to the State Church, to house their tenants in damp, decaying, neglected cottages, without repairs, and to act as no government would dare, while Mr.

Wallace quotes from G. C. Brodrick in his "English Land and English Landlords," where he says:

"The landed interest of England is estimated to have received a sum exceeding the national revenue from railway companies alone over and above the market price of the land thus sold." The italics are mine, to call attention to the fact that this sum of £70,000,000 or £80,000,000 paid to the landlords is a permanent injury to the community, by increasing to that extent the unproductive capital expenditure of the railway companies of the kingdom; while no class has received so much benefit from railways as the landlords, in the enormous increase given thereby to the value of their estates, so that if they had freely given the land required to construct the lines, they would still have been gainers.

Landlordism in Ireland has not been worse, tho its worst developments have been till recently more common. To-day in Ireland (*q. v.*) the tenant is better defended than in England, Scotland, or the U. S. Of the past Mr. Wallace says (ch. xiii.):

Mr. T. P. O'Connor tells us that in the four years 1849-52 there were 221,845 evictions, whole townlands being depopulated and their human inhabitants driven out to make room for cattle and sheep, as being more profitable to the landlords.

A report to the Poor Law Commissioners states that many occupiers were forced out of their homes at night in winter, even sick women and children not being allowed to stay in the houses till morning!

And the power to do all this, be it remembered, is a necessary consequence of unrestricted private property in land. The following account of an eye-witness is taken from a published pastoral letter of the Roman Catholic Bishop of Meath: "The horrid scenes that I then witnessed I must remember all my life long. The wailing of women; the screams, the terror, the consternation of children; the speechless agony of honest, industrious men, wrung tears of grief from all who saw them. I saw the officers and

Ireland men of a large police force, who were obliged to attend on the occasion, cry like children at beholding the cruel sufferings of the very people whom they would be obliged to butcher, had they offered the least resistance. . . . The landed proprietors in a circle all round—and for many miles in every direction—warned their tenantry, with threats of direct vengeance, against the humanity of extending to any of them the hospitality of a single night's shelter. Many of these poor people were unable to emigrate with their families; while at home the hand of every man was thus raised against them."

Perhaps the worst landlordism has been in Scotland. Says Mr. Wallace (ch. iv.):

Under the old system the Highland chief was a petty sovereign, who retained civil and criminal jurisdiction over his clansmen and the power of making war on other chiefs and clans. But these clansmen were never either serfs or vassals, but free men; and the clan was really a great family, all the members of which were supposed to be, and often actually were, of one blood. It was a true patriarchal system, totally distinct from the feudal system of Europe; and the clansman owed fealty and military service, as well as certain dues or payments, to his chief, these were given through love and duty rather than through fear, and every petty clansman held his land and his rights to pasture and wood and turf, and to hunt and fish over the mountains and lakes, by the same title as the chieftain held his more extensive lands and privileges. As well express by an able writer in the *Westminster Review*—"No error could be grosser than that of viewing the chiefs as unlimited proprietors, not only of the arable land, but of the whole territory of the mountain, lake, river, and seashore, held and won during hundreds of years by the broadsword

Scotland of the clansmen. Could any MacLean admit, even in a dream, that his chief could clear Mull of all the MacLeans and replace them with Campbells; or the MacIntosh people his lands with MacDonalds, and drive away his own race, any more than Louis Napoleon could evict all the population of France and supply their place with English and German colonists?" Yet this very power and right the English Government, in its aristocratic selfishness, bestowed upon the chiefs, when, after the great rebellion of 1745, it took away their privileges of war and criminal jurisdiction, and endeavored to assimilate them to the nobles and great landowners of England. The rights of the clansmen were entirely left out of consideration. . . . By hundreds and thousands at a time the occupiers of the soil were driven from their homes, and were many of them forced to leave the country which they had so bravely defended on many a hard-won battle-field. . . . As to the nature and extent of this extermination Dr. Macdonald says:

"The extermination of the Highlanders has been carried on for many years as systematically and relentlessly as of the

North American Indians. . . . They were forced away from that which was near and dear to their hearts, and their patriotism was treated with contemptuous mockery."

Again: "I know a glen, now inhabited by two shepherds and two gamekeepers, which at one time sent out its thousand fighting men. And this is but one out of many that might be cited to show how the Highlands have been depopulated. Loyal, peaceable, and high-spirited peasantry have been driven from their native land—as the Jews were expelled from Spain, or the Huguenots from France—to make room for grouse, sheep, and deer. . . ."

OTHER COUNTRIES

For statistics of landownership, see each country. See also AGRICULTURE. France is the typical land of peasant proprietorship, but here only 9 per cent of her population hold agricultural land. In Austria 14 per cent hold such land, and in Russia 11 per cent, but many of these holdings are so minute as not to furnish a living to the owner. In Russia 1 per cent of the families are said to own 40 per cent of the land. In Prussia, in 1859, 22,000 nobles are said to have owned 37,900,000 acres, or nearly half the cultivated land, while the crown held 11,200,000 acres more, or five eighths of the land in the hands of 1 per cent of the people. But in the next ten years 16,700,000 acres of the lands of the nobility were broken up into farms for the peasantry. Professor Parsons, who gives these facts, presents the following table of concentration of wealth ("The Story of New Zealand," p. 737):

CONCENTRATION OF WEALTH

| COUNTRY | Average area of estates (farming land), acres. | Percent of population holding agricultural land. |
|---------------------|--|--|
| United States..... | 134 | 8 |
| Australia..... | 380 | 5 |
| New Zealand..... | 150 | 15 |
| United Kingdom..... | 390 | 5 |
| France..... | 32 | 9 |

III. The Meaning of Landownership

Man is "a land animal." He cannot produce; he cannot propagate his kind; he cannot live, without land. This is patent to all. Yet it is frequently forgotten in economic discussions. Men interest themselves in this and that so-called "practical question," and overlook the fundamental fact and necessity of human life. Yet no man ever denied or can deny the absolute necessity of land to human life. John Stuart Mill begins his "Principles of Political Economy" with the words: "The requisites of production are two, labor and appropriate natural objects—i. e., land. Says Cardinal Manning:

The land question means hunger, thirst, nakedness, notice to quit, labor spent in vain, the toil of years seized upon, the breaking up of homes, the misery, sicknesses, death of parents, children, wives, the despair and wildness which spring up in the hearts of the poor when legal force, like a sharp harrow, goes over the most sensitive and vital right of mankind. All this is contained in the land question.

The only misunderstanding on this point can come from a failure to realize what is meant in economic discussion by the word *land*. It means not only the earth surface of the world; it means the surface of the whole world, earth and water, all that is in the earth and in the water except man and the

Economic Value of Land

labor of man. Says Jevons ("Political Economy Primer," p. 26): "When we speak of land we really mean any source of materials, any natural agent." Economists thus use the word *land* because among all natural agents land is so far the most important that it can be used to represent all the rest. Air is equally necessary to life, but under ordinary circumstances air cannot be appropriated, and hence has no exchange or commercial value. Under those few circumstances, as in a crowded city, where air cannot be freely obtained, it has a commercial value, but it for the most part goes with the land, and may be economically considered as a part of land. Remembering, then, what is meant by land, there can be no question of the fundamental importance of land to human life, and what results must be involved in its monopolization. But before we analyze this, notice one other point. We stand to-day on the land question at a crisis in the world's history. For the first time in the history of the world all the land in the northern temperate, and, indeed, almost all in the lower temperate zone, has been appropriated. Now the northern temperate zone has been thus far the only zone which has produced the great controlling civilizations of the world. Down to the present time any persons or companies of persons desiring more land could move somewhere in the north temperate zone and find good land wholly or very nearly wholly unappropriated. From the fields and vales of Asia, early in the history of the world, gigantic nomadic tribes and hordes poured westward, to find new grazing fields in eastern Europe; later they overran Europe, founding the Greek and Roman civilizations, the early Celtic races. Still later, in the migration of the Goths, were planted the civilizations we know to-day. When this migration was substantially completed, Columbus discovered a new world, and Europe overflowed to the Atlantic coast of the American continent. Since then civilization has spread across the continent, till at last, in our day, population has reached the Pacific coast, filled all spaces, and completed the belt of the world. By irrigation and other processes some land now worthless may be reclaimed; here and there small tracts of land may yet be had almost for the asking; population in many sections is scarce; but, roughly speaking, all the land is appropriated; the U. S. public domain nearly all sold; the best land all occupied. What is left is either inferior soil or to be made useful only at unusual cost. The modern movement of the Goths is filling up our cities. The significance of this condition in the world's history cannot be overestimated.

Let us, then, now examine some of the chief results of land monopolization. Among the first results must be the dependence in all civilized countries of those who have not land upon those who have. If, as we have seen, land is necessary to production and to life, the masses in all countries must be dependent on those who own the soil. Alike under the Czar and in "free" America, plutocracy reigns and must reign, while the people are dependent on the few for the first neces-

sities of existence. Says an old Saxon proverb: "The landless man is an unfree man." Henry George says ("Social Problems," ch. xv.):

That a people can be enslaved just as effectually by making property of their lands as by making property of their bodies is a truth that conquerors in all ages have recognized, and that as society developed the strong and unscrupulous who desired to live off the labor of others have been prompt to see. The coarser form of slavery, in which each particular slave is the property of a particular owner, is only fitted for a rude state of society, and with social development entails more and more care, trouble, and expense upon the owner. But by making property of the land instead of the person, much care, supervision, and expense are saved the proprietors; and the no particular slave is owned by a particular master, yet the one class still appropriates the labor of the other class as before.

We have abolished negro slavery in the United States. But how small is the real benefit to the slave!

But what comes of this land slavery? First, the horrors of the overcrowded city. Unable to obtain land in the country on which they can get a living, the landless, or the peasants, as in Russia, from allotments too small to support life, crowd into the great cities and produce the slums. What that means is well known. (See SLUMS.) But it has its effects on the country also. Says Mr. George (*idem*, ch. xxi.):

As the cities grow, unwholesomely crowding people together till they are packed in tiers, family above family, so are they unwholesomely separated in the country. The tendency, everywhere that this process of urban concentration is going on, is to make the life of the country poor and hard, and to rob it of the social stimulus and social gratifications that are so necessary to human beings. The old healthy social life of village and townland is everywhere disappearing.

Poverty In England, Scotland, and Ireland the thinning out of population in the agricultural districts is as marked as is its concentration in cities and large towns.

In Ireland, as you ride along the roads, your car-driver, if he be an old man, will point out to you spot after spot which, when he was a boy, were the sites of populous hamlets, echoing in the summer evenings with the laughter of children and the joyous sports of young people; but now utterly desolate, showing, as the only evidences of human occupation, the isolated cabins of miserable herds. In Scotland, where in such cities as Glasgow human beings are so crowded together that two thirds of the families live in a single room, where if you go through the streets of a Saturday night you will think, if you have ever seen the Terra del Purgatori, that these poor creatures might envy them; there are wide tracts once populous now given up to cattle, to grouse, and to deer—glens that once sent out their thousand fighting men now tenanted by a couple of gamekeepers. So across the Tweed, while London, Liverpool, Leeds, Manchester, and Nottingham have grown, the village life of "merrie England" is all but extinct.

So in the agricultural districts of our older states the same tendency may be beheld; but it is in the newest states that its fullest expression is to be found—in ranches measured by square miles, where half-savage cowboys, whose social life is confined to the excitement of the "round up" or a periodical "drunk" in a railroad town, are the only diversions; and in bonanza farms, where in the spring the eye wearies of seas of waving grain before resting on a single home—farms where the cultivators are lodged in barracks, and only the superintendent enjoys the luxury of a wife.

But out of this condition spring not only the horrors of the slums, but low wages for all wage-workers. The wage of the man at work is lowered by the competition of the man out of work. Trade-unions force up and keep up wages for a few; but a crisis comes, and in the majority of trades the workman, having no land to live on to tide himself over a hard day, is unable to keep up his dues, and the trade-union is broken up. In many unskilled trades, organization is all but impossible, because of the unemployed, who will and must compete at any price. In the U. S. organized labor includes only some 7 per cent of the persons in the U. S. engaged in gainful occupations. The main occasion of competition is the lack of opportunity upon the soil.

But the monopolization of land produces not only the extremely poor but the extremely rich.

The Unearned Increment

Men acquire a little money by work; but the great fortunes are made by investment, and often by speculation. The great sphere for investment and speculation is land. Men invest in Western mortgages, in mines, above all in city and suburban real estate. They do nothing, but their money grows. The result is *unearned increment*. Land in cities is valuable simply because it is in the midst of population. A store in New York City is worth more than a store in the country, because it has more purchasers; more people pass its windows. As the city grows in size the land rises in value. The owner of the land does nothing. He may sleep, live in luxury, gamble, idle, be an angel or a voluptuary; it matters not what he is or what he does; so long as he is a landowner his land may rise in value. Such rise in rent is *unearned increment*. It is produced, not by him, but by the community which gives the land its value. . . . On the present site of Chicago in 1816 there was not a white person, and the land was practically valueless; the census of 1890 estimates the real estate value of the city at \$1,330,000,000.

The Illinois Labor Bureau in 1895 ("Eighth Annual Report," pp. 104-253) made a careful investigation of land values in the city of Chicago. The most valuable section is known as the "South Side," and its boundaries are the Chicago River on the north and west, Twelfth Street on the south, and Lake Michigan on the east. Exclusive of streets it contains 351.42 acres. All the great stores, wholesale and retail, the high office buildings, and the great banking institutions are found within this area. Deducting 30 acres of public land owned by the nation, state, county, and cities, and 55.13 acres owned and used by the railroads, there remain 266.29 acres belonging to individuals and private corporations. This the bureau estimates to be worth \$319,000,000 for the land alone, without reckoning the improvements, worth as much more. Of this the largest holder, Marshall Field, owns \$11,000,000, and the next largest holder, Levi Z. Leiter, \$10,500,000. There are in all 1,198 owners of this \$319,000,000, of whom 18, or 1½ per cent, own \$65,000,000, or over 20 per cent of the total. Eighty-eight persons own \$136,000,000, which is nearly one half of the business center of the city of Chicago ("Report," p. 247).

According to this same report (p. 370), one quarter acre in Chicago in 1830 was worth \$20; in 1840, \$1,500; in 1850, \$17,500; in 1860, \$28,000; in 1870, \$120,000; in 1880, \$130,000; in 1890, \$900,000; in 1894, \$1,250,000.

It is by such leaps that those who bought land fifty, thirty, twenty, even ten years ago, have made fortunes without doing themselves any economically productive work.

Present conditions as to land, too, are the potent cause of innumerable moral ills. People are shocked to-day at the growing tide of social immorality, licentiousness among the wealthy, laxity among the poor. When the poor cannot get work, when they are crowded into rotting tenements, where privacy is impossible, where modesty can scarcely be, where children are compelled to grow up amid ribaldry, drunkenness and prostitution are all but inevitable. They become still more inevitable when thousands of idle young men from the luxurious classes set the example of profligacy to still more thousands of young men of the lower and middle classes. Other moral evils arise. The opportunities to make wealth by land investment develop the love of speculation, and in unexpected circles, even among women. Honest labor becomes despised. Life in the great cities becomes among the poor a desperate scramble for existence; among the wealthy a debasing struggle to grow more wealthy without work.

Moral Evils

From these moral evils result political evils. When the many are poor and the few are rich; when the corporations need votes and the professional politicians need money, political purity becomes scarce. The greatest steals, too, from the national government have been land steals on the part of railroads through land grants on conditions never fulfilled; land steals on the part of great syndicates under the cover of homestead laws. Great estates and great fortunes are slaying democracy in America. Such are some of the results of the present conditions of land monopoly among all civilized peoples.

IV. Land Reforms

1. Some would seek reform by increasing the number who own small land holdings. The classic argument for this view is John Stuart Mill's. In his "Principles of Political Economy" he devotes many pages to collecting testimony to show the advantages of peasant proprietorship. Among many other workers, he quotes Sismondi as saying ("Studies in Political Economy," Essay iii.):

Small Holdings
Wherever we find peasant proprietors, we also find the comfort, security, confidence in the future, and independence which assure at once happiness and virtue. The peasant who with his children does all the work of his little inheritance, who pays no rent to any one above him, nor wages to any one below, who regulates his production by his consumption, who eats his own corn, drinks his own wine, is clothed in his own hemp and wool, cares little for the prices of the market; for he has little to sell and little to buy, and is never ruined by revulsions of trade. . . . Of all cultivators he is the happiest, and at the same time the land nowhere occupies, and feeds amply without becoming exhausted, so many inhabitants as where they are proprietors. Finally, of all cultivators the peasant proprietor is the one who gives most encouragement to commerce and manufactures, because he is the richest.

Arthur Young is quoted as saying ("Travels in France, 1787-89," vol. i., p. 88, and vol. ii., p. 51):

"The magic of *property* turns sand to gold." And again, "Give a man the secure possession of a bleak rock, and he will turn it into a garden; give him a nine years' lease of a garden, and he will convert it into a desert."

Considerations such as these have induced many European economists, except perhaps in England, to believe that in peasant proprietorship or the owning of the land in small holdings lies the solution of the land question.

Those who would meet the land problem in this way look for reform to the abolition of all laws or customs, as in England, of entail, or any expedient for keeping large estates in one family. They seek laws facilitating land transfer; they hope for cooperative agriculture (q. v.). In the cities and industrial communities their main reliance is building associations, enabling the workman to buy a home.

The objections to this view are very great. No one who knows the present condition of the peasant proprietors in continental Europe believes them much if any more prosperous than the agricultural classes of England under a system of landlordism. In Russia, the peasant proprietors cannot live. (For France, see AGRICULTURE.)

The majority of English economists therefore have preferred:

2. The system of the ownership of the soil in large properties and the renting of it to tenants, protected, however, by laws of tenant-right, etc. The small owner cannot apply capital to land. Small farming is uneconomic farming. If this

was so in the past, it is particularly so to-day. Marshall says ("Economics of Industry," Book I., ch. ix.):

Recent events (1885) have again increased the difficulties against which peasant proprietors have had to contend. Great importations of grain and meat from new countries have lowered prices, but the burden of the fall has been borne in England chiefly by the landlords and farmers. The laborers have on the average at least as much of the necessities, comforts, and luxuries of life as at any previous time; and this in spite of the fact that many of the ablest and strongest of them have migrated to the towns or to new countries. But the peasant proprietors, particularly of arable land, have nothing to shield them from the full effects of the fall in prices. Many of them have lost nearly all their little margin of savings and not a few are in debt. Even those who are in outward appearance prosperous frequently work harder and live more sparsely than the English laborers.

Mr. D. A. Wells says ("Recent Economic Changes," p. 461) "that the only possible future for agriculture, prosecuted for the sake of producing the great staples of food, is to be found in large farms, worked with ample capital, especially in the form of machinery, and with labor organized somewhat after the factory system, is coming to be the opinion of many of the best authorities both in the United States and Europe."

The day of the small farmer under the present industrial system seems over. He cannot compete with bonanza farms tilled and worked with expensive machinery, well stocked, etc. Under the present system of landownership the future means large farms owned by capitalists, with the mass of the people as their tenants. This is the ideal of the second class of those who look for reform without radical change. They say, let the world copy England. Let there be large estates owned by rich capitalists, perhaps by syndicates; let them be worked by tenants, protected by the law, well paid, and prosperous.

But this view will not endure. For better or for worse, democracy has the future. Even in England to-day, where this system has been carried farthest, where the landed aristocracy furnishes undoubtedly the best landlords of the world—even in England, step by step, democracy is replacing the landlord's power. Above all, as we shall in a moment see, is the sense of justice demanding to-day that the land be for all, and not be monopolized by the few. We come, therefore, to consider radical proposals for land reform.

3. Undoubtedly most distinctively land reformers advocate the plan of the *single tax*, prominently advocated in Mr. Henry George's "Progress and Poverty." For a full consideration of this proposition, see SINGLE TAX; we simply outline it here. It proposes that an annual tax should be put on all land equal to the full

The Single Tax
rental value of the land *apart from improvements*. This would leave in the landowner's hand, untaxed, all the improvements or labor he has put on the land, but tax away from him into the hands of the State for the equitable good of the community all natural land value. No titles need be changed in this way; no labor would be discouraged; the results of no labor would be taken, but the value of the land itself, which no individual has created, and which equity demands should belong to all, would be taken for all. Especially in cities, where enormous values have been created by the presence of the community, would the value of the land be taken for the community which created it. The results of this plan would be to kill landlordism without discouraging honest labor. This would be the case because land, being taxed its full rental value, only those would hold land who got something out of it more than its rental value, and

this could only be done by putting value into it. The landlord would be taxed out of existence; those who by useful labor put value into the land could alone be its owners.

It is one of the best features of the system, that it could be brought in gradually by simply raising the rate of land taxes every few years, till finally they equal the whole rental value. This process is now actually going on in Australasia.

Nor would the system bring hardship on small farmers and the holders of small lots, because it would bring so much money into the State that there would need to be no other tax; it would be a *single tax*. It would abolish all the direct and indirect taxes which to-day press upon the consumers of the land. In free-trade countries it would make unnecessary all other direct taxes, and in protective countries it would do away with all those protective tariffs which raise the price of all the commodities the poor have to buy. (For a full discussion of this, see *SINGLE TAX*.)

Nor would it, too, necessitate the socialistic expansion of the State. Placing one tax, and that the easiest to collect, in place of all, and opening up land so that every man could have opportunity to work, it could largely reduce the machinery of the State, giving democratic freedom and opportunity to all.

The supreme argument, however, for the proposition is that it would conform to the strictest justice by placing all on an exact natural equality in all but their own abilities. Those who held the best land would have to pay for it the exact amount of its superiority to other land, because all would pay the whole rental value. Each man would then get exactly according to his ability. Such is the argument.

4. We come next to consider a proposition akin to this and yet very different—that of the anarchists, or extreme individualists, who would do away with all government and all taxation, establishing a so-called system of "free land," or land to belong to those who can use it and defend it, either by personal defense or by cooperating to defend each other's land.

5. At the opposite extremes from this lie the various proposals of communists, nationalists, Socialists, land nationalizers, who would vest all title in the community and have the land owned and operated by cooperative commonwealths. This would mean, of course, socialism with all that that entails. It is utterly different from the proposition of the single tax. The single tax would diminish the sphere of the State; socialism would exalt the State. We here only state the various propositions, leaving them to be discussed under their various heads.

V. Argument For and Against Private Property in Land

The argument for private ownership of the land may be divided into two: the argument from expediency and the argument from justice.

Most economists to-day argue from expediency. They maintain that the argument from justice is so uncertain and the theory of natural rights so open to debate that it can settle nothing. One man declares this to be just, another that; the argument from expediency they consider the only one we can appeal to, and this the opponents of land

nationalization, or of the single tax, declare to be strongly in favor of the private ownership of land. John Stuart Mill, tho later converted to a theory of land nationalization coupled with a scheme for compensating landlords, and still later (see *MILL*) converted to the belief that the single tax was the best way in which to realize the equal right in the value of his soil, in his earlier works made a strong plea from expediency for individual ownership of the soil. He says ("Dissertations and Discussions," vol. v.):

The great majority of mankind will work much harder and make much greater pecuniary sacrifices for themselves and their immediate descendants than for the public. In order, therefore, to give the greatest encouragement to production, it has been thought right that individuals should have an exclusive property in land, so that they may have the most possible to gain by making the land as productive as they can, and may be in no danger of being hindered from doing so by the interference of any one else. This is the reason usually assigned for allowing the land to be private property, and it is the best reason that can be given.

Later economists dwell on the claim that any radical change in land tenures could not safely, if it could justly, be enacted without compensation, and that with compensation the change would be of doubtful worth to the community.

Professor Hadley ("Economics," 1896, p. 472) may be quoted as representative of this view. He says:

The principle that private property must not be taken without compensation is no mere accidental phrase let fall by courts or constitution makers. It is an axiom of political science. If the progress of society renders the abolition of an institution necessary, compensation follows as a matter of course. . . . This is the critical weakness in land nationalization plans, like that with which John Stuart Mill's name was identified. The advocates of this plan proposed that England should buy out the landowners and appropriate the future gain in value. No fault could be found with the equity of this proposal. But as a fiscal measure it was radically defective. Leaving out of account the inevitable losses due to a scheme of quasi-compulsory purchase, the scheme must have ended in disaster, because the lands which it was proposed to buy have fallen in value instead of rising. . . . These arguments do not militate against reforms in taxation, which shall carry us in the general direction indicated by the single-tax theory. Wagner, after an investigation of the subject whose thoroughness is worthy of the highest praise whether we can accept his conclusions or not, is inclined to look with favor on public appropriation of future increments in the value of city real estate as distinct from agricultural land. Without going so far as Wagner, most economists would be willing to agree that more taxes should be assessed upon economic rent and less upon improvements.

Professor Sidgwick, writing from the standpoint of "utilitarian individualism," puts substantially the same view in other words when he says ("Elements of Politics," chap. v.):

If it is granted, as I should grant, that the landless members of the community have a legitimate claim to the compensation for the opportunities of applying labor to land from which they are excluded by its appropriation, then the question as to the manner in which this compensation is to be taken can only be decided, I conceive, by a careful balance of expedencies. On the one hand, it is for the general good that the individual cultivator's energy and enterprise should be encouraged as much as possible, and complete ownership is the most simple and effective way of encouraging it; on the other hand, it seems probable that the prospective increase of value, accruing independently of the owner's energy and enterprise, will not be adequately represented in the sum received for the land, so that the compensation thus directly secured to future generations for the opportunities from which they are excluded is not likely to be adequate. In practically deciding the question we have to take into account considerations that do not fall within the scope of the present discussion, since we cannot but be partly influenced by the moral and intellectual qualities likely to be possessed by the government that, if the system of leases be adopted, would have the delicate task of artificially providing for the lessee that encouragement of industry and thrift which the system of private ownership gives him naturally.

This is the view probably held by most professorial economists to-day. The more popular

**Socialist
View**

**Arguments
for Private
Ownership**

argument from expediency claims that the whole history of the world shows that civilization, prosperity, and progress have gone with private property in land, and that to subvert this institution would be to revert to barbarism and discourage thrift and industry. This argument is undoubtedly the main popular argument on this side. It is repeated by its supporters over and over again, and in a thousand forms. Mr. J. C. Spence, in a tract on "Property in Land," published by the Liberty and Property Defense League, says:

The whole history of agriculture might be claimed as evidence that land held in common by a tribe or a people can never be put to its best uses; that fixity of tenure is essential to improvement, and that no tenure is so perfect as absolute ownership. The fact that manufactures and commerce prosper best where least hampered by State interference indicates that the proper treatment of the land question is the abolition of all artificial restrictions on its absolute ownership.

But the supporters of private property in land do not only argue from expediency, they also argue from justice. Mr. Herbert Spencer, who, in his "Social Statics," written in 1851, declared that equity "does not permit property in land," in his "Justice" (1891) says that tho this be true, nevertheless, the State having long allowed the claims of the landowners, to tax away or to legislate away the value of their lands would be unjust, while to compensate them would cost more than it is worth; and that even if titles to land do ultimately rest on robbery and injustice in the original ownership, the landless to-day cannot be shown to represent those from whom the land was originally taken.

Another form of the argument that land nationalization or even the system of the single tax would be unjust is the claim that the value of land to-day, even in the cities, does not come from the mere natural sources or even from the mere growth of the community, but to a very large extent at least from the labor, the industry, the wit and invention of landowners, and that hence to legislate or tax away land values would rob the landowners of the results of their labors and their fathers', and hence both be unjust and inexpedient in discouraging industry and progress. In the *Political Science Quarterly* (vol. vi., pp. 625-634) Mr. C. B. Spahr argues that land in New York City is worth *per family* \$4,000; in Ohio, \$2,000; and in Mississippi, \$400; and that therefore the value of the land cannot be measured merely by the number of people on it, but does depend very largely on the improvement of the land. The pouring of Hungarians and Italians into certain portions of New York City does not raise, but lowers the value of land in that vicinity. Therefore land values come not merely from population or economic rent, but from the use made of the soil, from the activities of the city; to tax land values to the full would therefore tax and discourage those whose energy and improvements have largely, tho it is admitted not wholly, made land valuable to-day. Mr. Edward Atkinson follows the same line of argument (Single Tax discussion before the American Social Association, Sept. 5, 1890) when he says:

Put two men of different capacity on land of the same quality, and on the same crop one will get a large rent, the other will barely get a subsistence. Deal with two lots of land in the same city; put a good building on one and a poor building on the other; one will yield a large rent, the other no rent at all. It is neither the quality of the land nor the possession of the land which governs the income; it is the labor and capital applied to the land, and, more than all, the mental

capacity (i. e., the mental faculty), which is the prime factor in all production. Land itself possesses no value. The price paid for it is paid for the choice of lots.

Economic rent is a mere hypothesis based on the supposed action of an economic man, like whom no man ever existed. It is not a working theory, and may be safely disregarded in the consideration of the subject with which we are now attempting to deal.

This argument thus claims that the value of the land of old countries like England, great centers like New York City, rich farming communities like Ohio, depends not primarily on growth of population or fertility of soil, but on what the owners of the soil have done and are doing, so that to take the value would be unjust and unwise. Such are the main arguments against all forms of land nationalization or a single tax.

To this it must be answered, first, that few if any radical land reformers propose to-day to compensate taxed landowners. They argue

that if it be true that equity does not permit property in land, injustice does not become justice by lapse of time, and that therefore the landowners have no equity in the land. They ask with Mr. Spencer himself, against his own later views: "How

long does it take for what was originally a wrong to grow into a right?" Land reformers, however, do not propose suddenly to tax or legislate away landed property. They propose to do it gradually and with full warning by gradually raising the tax slightly every few years, so giving present proprietors full warning to prepare for the new conditions. This does away with the whole argument that land nationalization with compensation would not pay. Even the economists quoted above favor increased taxation of land values.

As for the argument from expediency, land reformers quote all the evils we have shown above to prove the inexpediency of private property in land. A single tax would preserve all the good points in the present system and do away only with its wrongs. The real user of the soil, so long as he used it productively, would, under the single tax—and the Socialists claim under socialism—have security of tenure. It would give all the spur to honest labor now given by private capital. It is rent only that would be destroyed.

The main argument against private landownership is its absolute injustice, as declared by Mr. Spencer himself, and by an overwhelming consensus of the deepest thinkers of all ages. Granted that the owners of the soil have contributed to human advance, they have had vastly more opportunity to do so. Put the children of the slums, *from their birth*, under the conditions of the land aristocracy of England, and who will say whether they might not have done at least as much. (See HEREDITY; ENVIRONMENT.) As it is, the poor, the landless, have at least equaled the land class in making the inventions and progress of the world. All that justice asks is equal opportunity for all and it is absolutely certain that this cannot possibly be where millions are deferred from access to the land.

7. We close this article by quoting the opinions of some thinkers whose weight and honesty of utterance are beyond question:

Herbert Spencer (in 1851; for his later view, see above): "Equity does not permit property in land. For if one portion of the earth's surface may justly become the possession of an individual, held for his sole use and benefit, as a thing to which he has an exclusive right, then other portions of its

surface may be so held, and our planet must then lapse into private hands. It follows that if the landowners have a valid right to its surface, all who are not landowners have no right at all to its surface. ("Social Statics")

Briefly reviewing the argument, we see that the right of each man to the use of the earth, limited only by the like rights of his fellow men, is immediately deducible from the law of equal freedom. We see that the maintenance of this right necessarily forbids private property in land. On examination all existing titles to such property turn out to be invalid; those founded on reclamation inclusive. It appears that not even an equal apportionment of the earth among its present inhabitants could generate a legitimate proprietorship. We find that if pushed to its ultimate consequences a claim to exclusive possession of the soil involves a landowning despotism. We further find that such a claim is constantly denied by the enactments of our legislature. And we find, lastly, that the theory of the coheirship of all men to the soil is consistent with the highest civilisation; and that, however difficult it may be to embody that theory in fact, equity sternly commands it to be done. ("Social Statics")

There is reason to suspect that the inhabited area, which cannot be produced by labor, will eventually be distinguished as something which may not be privately possessed. ("Letter to the Times," Nov. 7, 1889).

Emile de Laveleye ("Primitive Property"): "The general principles of jurists commend the universal custom of primitive nations, which reserved to the tribe the collective ownership of the soil."

Bishop Nulty: "The land of every country is the common property of the people of that country."

Richard Cobden: "I warn ministers, and I warn landowners and the aristocracy of this country, against forcing upon the attention of the middle and industrial classes the subject of taxation. For great as I believe the grievance of the protective system, mighty as I consider the fraud and injustice of the corn laws, I verily believe, if you were to bring forward the history of taxation in this country for the last one hundred and fifty years, you will find as black a record against the landowners as even in the corn law itself. I warn them against ripping up the subject of taxation. If they want another league at the death of this one, if they want another organization and a motive, then let them force the middle and industrial classes to understand how they have been cheated, robbed, and bamboozled."

Grant Allen (*Contemporary Review*, May, 1889): "Not one solitary square inch of English soil remains unclaimed on which the landless citizen can legally lay his head, without paying tax and toll to somebody; in other words, without giving a part of his own

Opinions

labor, or the product of his labor, to one of the squatting and tabooing class (the landlords), in exchange for their permission (which they can withhold if they choose) merely to go on existing upon the ground which was originally common to all alike, and has been unjustly seized upon (through what particular process matters little) by the ancestors or predecessors of the present monopolists."

Mr. Gladstone ("Speech at West Calder," Nov. 27, 1879): "Those persons who possess large portions of the earth's space are not altogether in the same position as the possessors of mere personality. Personality does not impose limitations on the action and industry of man and the well-being of the community as possession of land does, and therefore I freely own that compulsory expropriation is a thing which is admissible, and even sound in principle."

("Speech at Hawarden," Oct., 1889): "I fully admit this—I stated it long ago in Midlothian, and I say it now without the slightest doubt—that if the time came when the British nation found that the land should be nationalized, and it would be wise to do it, they have a perfect right to do it."

Thomas Carlyle: "The notion of selling for certain bits of metal the Iliad of Homer, how much more the land of the world Creator, is a ridiculous impossibility."

J. A. Froude: "Under the feudal system the proprietor was the crown, as representing the nation; while the subordinate tenures were held with duties attached to them, and were liable, on non-fulfilment, to forfeiture."

"Land never was private property in that personal sense in which we speak of a thing as our own, with which we may do as we please."

"Land, properly speaking, cannot be owned by any man. It belongs to all the human race."

Frederic Harrison ("Lecture to the Edinburgh Philosophic Institution," Jan., 1884): "They must be ready to act on the ancient principle of the English law, that the nation was the ultimate owner of the soil."

Rousseau ("Discours sur l'Origine de l'Inégalité parmi les Hommes," 1753): "The first man who, having enclosed a plot of ground, took upon himself to say, 'This is mine,' and found people silly enough to believe him, was the real founder of civil society. How many crimes, how many wars, how many murders, how much misery and horror, would have been spared the human race if some one, tearing up the fence and filling in the ditch, had cried out to his fellows: 'Give no heed to this impostor; you are lost if you forget that the produce belongs to all, the land to none!'"

Prof. F. W. Newman: "The history of the gradual, stealthy, but really nefarious revolution, in which landlords, by their own legislative power and their influence over lawyers, changed themselves into landowners made to be popularized."

Sir Henry Maine ("Village Communities"): "The terrible problem of pauperism began to press on English statesmen as soon as the old English cultivating groups (in which land was collectively, and not privately, owned) began distinctly to fall to pieces."

John Ruskin ("Time and Tide"): "Bodies of men, land, water, and air are the principle of those things which are not, and which it is criminal to consider as, personal or exchangeable property."

The Right Hon. John Morley ("Interview at Newcastle," Nov., 1889): "I have always thought our forefathers made a great mistake when they did not reserve the minerals to the nation."

("Speech in the House of Commons," May 6, 1890): "The question of the unearned increment will have to be faced. It is unendurable that great increments which have been formed by the industry of others should be absorbed by people who have contributed nothing to that increase."

Sir William Blackstone ("Commentaries"): "Accurately and strictly speaking, there is no foundation in nature or in natural law why a set of words on parchment should convey the dominion of land."

Ralph Waldo Emerson: "While another man has no land, my title to mine, your title to yours, is at once vitiated."

Judge Hughes ("Speech at Church Congress," 1888): "The first thing which the democracy will write upon the slate will be the nationalization of the land."

Alfred Russel Wallace ("Malay Archipelago," 1868): "We permit absolute possession of the soil of our country with no legal rights of existence on the soil to the vast majority who do not possess it. A great landholder may legally convert his whole property into a forest or hunting ground, and expel every human being who has hitherto lived upon it. In a thickly populated country like England, where almost every acre has its owner and occupier, this is a power of legally destroying his fellow creatures; and that such a power should exist, and be exercised by individuals, in however small a degree, indicates that as regards true social science we are still in a state of barbarism."

Adam Smith ("Wealth of Nations"): "The rent of land, therefore, considered as the price paid for the use of the land, is naturally a monopoly price. It is not at all proportional to what the landlord may have laid out upon the improvement of the land, or to what he can afford to take; but to what the farmer can afford to give."

John Stuart Mill ("Principles of Political Economy"): "The essential principle of property being to assure to persons what they have produced by their labor and accumulated by their abstinence, this principle cannot apply to what is not the produce of labor, the raw material of the earth." "No man made the land; it is the original inheritance of the whole species." "The land of every country belongs to the people of that country."

General Francis Walker ("First Lessons in Political Economy"): "It certainly is true that any increase in the rental value or selling value of land is due not to the exertions and sacrifices of the owners of the land, but to the exertions and sacrifices of the community. It is certainly true that economic rent tends to increase with the growth of wealth and population, and that thus a larger and larger share of the product of industry tends to pass into the hands of the owners of land, not because they have done more for society, but because society has greater need of that which they control."

Prof. Alfred Marshall ("Principles of Economics"): "All writers on economics are compelled to make a distinction between land and other things."

LAND BANKS. See BUILDING AND LOAN ASSOCIATIONS; COOPERATIVE BANKS.

LAND LAW REFORM ASSOCIATION: This society is the successor of the Land Tenure Reform Association, founded more than thirty years ago, of which John Stuart Mill was president. It comprises two associations: The Leasehold

Enfranchisement Association, founded in 1883, and the Free Land League, founded in 1885. An amalgamation of these two bodies took place in 1896. In 1897 an investigation was undertaken into the condition of the cottages in the villages of England and Wales. The association holds conferences and issues tracts. *President*, Sir Walter Foster, M.P.; *Organising Secretary*, C. E. Hecht; 21 John Street, Adelphi, London, W. C.

LAND NATIONALIZATION: The substitution of national for private ownership of land is a scheme of general economic and social reform. It is not merely a sectional change or remedy for a particular grievance, but is claimed as a measure of wide, even universal, significance. It is primarily an economic reform, securing a more equitable distribution and an increased production of wealth. Attainment of this end implies solution of the chief modern social problems.

According to the land nationalization theory, the evils popularly attributed to competition are really due to competition in connection with a faulty system of land tenure. Private ownership, the basis of the land systems of the countries otherwise most advanced, is unsuited to modern conditions. It is inconsistent with the best use of land, as it imposes public burdens upon those who carry on the work of the world, while exempting those who merely charge for the use of natural opportunities; and it especially favors those who keep land wholly or partially idle, impeding present production for possible future gain to themselves. This system is regarded as the chief cause of difficulty in obtaining remunerative employment. That there should be a floating body of unemployed, tending to become unemployable, is unnatural and perplexing in the present stage of knowledge and mechanical efficiency. Private ownership of land, thus directly injurious to labor, is also obstructive to the most profitable employment of capital—using the term in its proper significance as an aid to production.

Advocates of land nationalization hold that the only satisfactory course is to abolish private ownership, all land becoming vested in the community, as represented by the State. (The character of the State will be materially altered in consequence, in the direction of conformity with the common welfare.)

All persons occupying land would do so as state tenants, with security of possession subject to payment of the annual value. This, like all values, would still depend upon competition, the business of officials being to estimate its amount.

The character of competition for land would alter; no person would have any inducement to take more than he required for use, to hold for a possible rise in value. The tendency would be to take the least quantity convenient, instead of, as now, the most he can get. (The advantage in a "new" settlement is easily realized.) The objection of a possible "corner" in land has been suggested; but any combination to render it scarce would raise values against itself as much as against others.

The change proposed is obviously a great movement toward equality of opportunity, though its full significance is only grasped by study and examination.

It appears late in the history of civilization to devise a land system upon scientific principles; this is probably because of the complex and elusive nature of economic problems. So the reforms advocated have hitherto been chiefly based upon private ownership—itsself the cause of the need for reform.

The ideal of reformers was long that of widely diffused private ownership, which naturally appeals to an energetic people suffering through "great estates." It is advisable to slightly compare land nationalization proposals with the ideals which they are displacing; but a thorough comparison would occupy much space.

At its best, small ownership has a tendency to render a nation non-progressive. Even regarded as a system it lacks stability. The small owner is tempted to mortgage, to obtain more working capital, and even, with the same object, to sell his property and continue in occupation as tenant. This is rendered possible because land fetches a higher price than other investments yielding the same income. It is for many reasons a favorite investment. It confers power and social distinction (particularly in Great Britain); its owners form an influential class, successful in obtaining privileges, including exemption from taxation; and there is always hope of increase in value. It becomes preeminently an investment for the rich; the relationship of landlord and tenant is assured, and its persistent development leads its advocates to claim it as the natural order, while its opponents are driven to artificial means of promoting subdivision.

Systems based upon private ownership, however subdivided, of land, have the evident defect that the idle or improvident may sell their interest and live temporarily on the proceeds. Thus there is a reversion to inequality, a tendency to establish an idle wealthy and an idle pauper class, both supported by others. Legislation restricting sale or mortgage, or guaranteeing possession of the homestead, creates new difficulties and frauds.

Under land nationalization these difficulties simply do not arise; the occupier has no salable interest other than in improvements, yet is placed in a better position, where it becomes easier to do right and less tempting to do wrong.

Land nationalization cannot properly be defined as either Socialist or individualist. With the ideal expressed by "the utmost freedom for every one, consistent with not infringing the equal freedom of others," land nationalization is completely in accord. Although liberalism, the political expression of the idea of equal freedom, long favored private ownership, tempered by diffusion, it was rather as an expedient than an ideal, no better plan being recognized as practical. Failure of this system in working is responsible for most of the attacks upon liberalism and individualism, with special reference to what has been called the "Manchester School of Political Economy."

Through the influence of Henry George and others, the subject is now better understood; the liberal attitude with regard to land has become modified, and is still progressing. "Free Trade in Land" (freedom to buy and sell) has declined, and land nationalization principles, expounded by the great individualist philosopher, Herbert

Peasant
Proprietor-
ship

Scope
and Aims

Socialist
or Individ-
ualist?

Spencer, in "Social Statics," have gained acceptance.¹

Though land nationalization is not essentially socialistic, Socialists advocate it as part of their program, it being fully recognized that their other proposals would be useless without it. Yet many Socialists could hardly be called land nationalizers, they having little idea of the probable working of the system, or belief in social improvement short of complete state organization of industry.

Land nationalization leaves untouched the question of competitive *versus* state industry. It permits the best working of both systems, and facilitates such changes between the two as may be found expedient, thus favoring the evolution of a "mixed" organization, such as will probably best suit human needs.

GEO. CROSOER.

LAND NATIONALIZATION SOCIETY, THE: The society was founded in 1881, as a result of the book "Land Nationalisation: its Necessity and Its Aims," by Dr. Alfred Russel Wallace, well known as contemporary with Darwin in connection with the doctrine of natural selection, and author of several popular works. By a coincidence he was also contemporary with Henry George in important work in social science. He showed that private ownership of land was contrary to justice and expediency. He advocated compulsory State purchase, with preference for payment by terminable annuities, thus striking at the custom of perpetual bequest, which he had long regarded as mischievous.

The influence of Henry George's views caused a division in the movement, some persons favoring taxation of land values but opposing direct compensation.

For many years the society did much to popularize the idea of public ownership, at first without much support from practical politicians. They regarded its policy with timidity. The value of the land of Great Britain is an unknown quantity; there is no annual taxation of land values, and no separate valuation. Unoccupied land is not assessed, and occupied land chiefly in proportion to improvements. There was a fear of purchase at inflated prices, leading to increased taxation. The enormous prices obtained for public purchases of land under compulsion acted as a warning against larger operations; though one merit of land nationalization proposals is that they can be effected by instalments. But attention began to be given to the principle of imposing moderate taxation upon the value of land as declared by owners, such value being taken as the price at which the State might purchase if it desired; this tending to secure correct returns. A bill embodying this principle was introduced into Parliament by Mr. J. W. Logan in 1904, and by Dr. MacNamara in 1905 and 1906; but, with the drawback of not being a government measure, it has not become law, though well supported. Whereas, a few years ago, it was difficult to get members of Parliament to support the principle of public ownership, there are now seventy who are vice-presidents of the society, and many others who favor its proposals. A "Public Land-ownership Committee" has just been formed (June, 1906) in the House of Commons in support

of the movement and to watch other legislation in its interest. There are already 120 members. It is not intended to exaggerate the progress of the movement, and it must be admitted that many of its supporters do not realize the indirect benefits involved in it, and do not necessarily give it the first place as regards its importance. Further, the Land Nationalization Society's income has seldom reached £1,000, a very small amount for what has been done, and especially for what needs doing. In these matters, however, improvement may reasonably be expected.

The principle of national ownership of land is embodied in an important (government) measure, the Small Holdings Bill, now (July, 1907) before Parliament. This proposes to give local authorities power to purchase land by compulsion, to retain the ownership of such land, to expend capital in improvements, and to let as small holdings, i. e., farms of five to fifty acres. Tho the measure is of limited application, it contrasts most favorably with the plan under which the land of Ireland is being converted into small freeholds, at great cost to the British taxpayer, and with considerable economic disturbance.

There is also a bill for the separate valuation of land in Scotland, which should be followed by a similar measure relating to the rest of the United Kingdom, and, later, by a reform of the system of local taxation and other important changes.

The secretary of the society is Mr. Joseph Hyder, and the office at 432 Strand, London, W. C.

GEO. CROSOER.

LAND RESTORATION LEAGUE, THE ENGLISH (since 1902 The English League for Taxation of Land Values): Formed in 1883, as the Land Reform Union, to advocate the principles of Henry George's "Progress and Poverty." Among the earliest members were Miss Helen Taylor, the Rev. Stewart Headlam, William Saunders, J. L. Joynes (late one of the masters in Eton College), Professor Symes (Nottingham), Minor-Canon Shuttleworth, G. B. Shaw, S. Olivier, Rev. P. H. Wicksteed, etc. From the first the new society entered on its campaign with marked vigor and success. A number of leaflets were issued, including a summary of the argument of Herbert Spencer's famous ninth chapter of "Social Statics," the accuracy of which, after more than ten years of uninterrupted publication, was later violently impugned by Mr. Spencer and vigorously and successfully defended by the league in the public press. A monthly paper, *The Christian Socialist*, was founded by members of the committee of the new society, and a guaranty fund raised for an extended "Henry George campaign." Mr. George visited England and addressed large meetings in London and the principal provincial towns. At the first annual meeting (May, 1884) the name of the society was changed to "English Land Restoration League." A manifesto drafted by Henry George was issued and the league settled down to its long siege of the citadel of landlordism. The history of the next few years is an unbroken record of great activity—lectures without number in the London clubs, meetings in town halls, open-air meetings in the parks and open spaces, conferences on the land question, newspaper correspondence, a voluminous output of leaflets and pamphlets, an occasional "Henry George campaign," Mr. Frederick Verender being its active secretary. The league has taken an active part in all the parliamentary

¹ It may be remarked that Herbert Spencer never withdrew his advocacy of the principle, though he later wrote against what he regarded as a danger of prematurely forcing its adoption.

and municipal elections. In 1891 a special fund was raised for village propaganda. A "red van" was fitted out, and a successful campaign was carried on and continued each year. In 1902, however, the league adopted its present name. (See LEAGUE FOR THE TAXATION OF LAND VALUES, THE ENGLISH.)

LAND TRANSFER REFORM: Under the ordinary forms of proving title to land great expense is always involved, especially if the land has been transferred a number of times. Indeed, this expense of securing an abstract in such cases and having the title properly examined by a competent lawyer reduces by a heavy percentage the amount received by the seller.

Again, there is frequently great difficulty in securing any clear title to land. An abstract cannot show a clear title; even the careful opinion of a well-trained real estate lawyer is only a ground for a presumptive opinion. If the land has been sold and bought several times, especially if some years have elapsed since such transfer, no one can be sure of his title. Court records show many an instance of innocent purchasers losing land fairly paid for through the defects of the present system of proving titles.

The Torrens system of land transfer, originating in Australia and applied in Manitoba, British Columbia, and Ontario, where the system has been in use for many years and with universal success, has been invented to meet this evil.

The system provides that any landowner may take his evidence of title to the land transfer office provided by law, and upon proving his title to the satisfaction of the registrar, who acts in behalf of the State, may have his land registered to him as owner, and may receive from the office a certificate to this effect. This registration gives him an indefeasible title; and if he wishes to sell, it is not necessary for him to trace his title beyond the one registration in the land transfer office. The government guarantees that title. In case of sale, he fills out a simple memorandum of the transfer; this, with his certificate, is taken to the registrar. The transfer is then entered upon the registrar's book and upon the certificate, and the transfer is accomplished. The purchaser has now the indefeasible title with the government guaranty. It is the registration that transfers the title—not the filling out of the memorandum of transfer, nor signing any certificate.

LANGE, FRIEDRICH ALBERT: German philosopher and economist, best known as the author of "The History of Materialism." He was born at Wald, near Solingen, Württemberg, in 1828; studied in Zurich and Bonn; was instructor at the gymnasium in Cologne, 1852-55; privat-docent at Bonn, 1856-58; professor of philosophy at Zurich, 1870-73, and at Marburg, 1873-75.

His political career began in 1862 at Duisburg when the school authorities warned instructors in the gymnasium from taking any active or even passive part in politics. Lange called a meeting of his colleagues and declared that this "admonition need not be heeded." He had to leave Duisburg, but continued his opposition to Bismarck both by word and pen. In 1864 he was elected a committee, with Bebel and Hirsch, to represent the Labor-Union. In 1865 he warned the working men against the teachings of Lassalle and his confrères.

Having for years waged an unsuccessful war against the government party and denounced their craze for annexation and changes of mind, he became disgusted with German politics and went to Winterthur, Switzerland, where he established the *Winterthurer Landbote*, teaching at the same time in the gymnasium. He joined the Democratic Party and fought untiringly for a revision of the cantonal constitution. Owing to the partiality of the Swiss people for France during the Franco-Prussian War in 1870-71, he became embittered, and abandoned politics forever. He was author of "Die Arbeiterfrage in ihrer Bedeutung für Gegenwart und Zukunft," 1865; "J. St. Mill's Ansichten über die Sociale Frage," 1866; "History of Materialism," 1862. "Logische Studien" appeared posthumously in 1877. His "History of Materialism" was begun and published in one year. He died in 1875.

LANGUAGES: The spread of a common language is one of the most important of social factors. Latin was once invariably the universal language and is to-day in Latin countries and in the Roman Catholic Church. Later, French became to some extent the language of international diplomacy. To-day English is much the most widely spoken of existing languages.

NUMBER AND PER CENT SPEAKING

| | 1801 ¹ | 1900 | 1801 | 1890 |
|-----------------|-------------------|-------------|------|------|
| English..... | 20,520,000 | 136,000,000 | 12.7 | 30.2 |
| French..... | 31,450,000 | 53,000,000 | 19.4 | 11.6 |

¹Mulhall's estimate.

Many attempts have been made at developing or creating a new international language. By far the most successful of these is now *Esperanto*, the invention of Dr. Zamenhof, of Warsaw, who in 1887 published a brochure, "An International Language, by Dr. Esperanto." At first little success rewarded him, but since 1897 its progress has been rapid and uninterrupted. There are now about three hundred groups, situated in all parts of the world, forming centers of active propaganda.

It has over twenty journals and magazines which circulate in every civilized country.

The distinguishing feature of *Esperanto* is its simplicity. The grammar is free from irregularities, and the number of grammatical forms has been reduced to a minimum. The vocabulary consists of some 3,000 international roots, but from each root a large number of additional words can be formed by means of prefixes and suffixes. The alphabet consists of 28 letters which have an invariable sound. The language is thus easy to learn and has been used at international congresses, notably at the Congress of Christian Endeavorers in 1906. A World Esperanto Congress was held at Cambridge, England, in 1907.

LANSBURY, GEORGE: Member of the British Poor Law Commission; born 1859 at Haleworth, Suffolk. Passed most of his life in East London in the coal trade, later in veneer

works, where he is now a partner. He was a member and honorary secretary of the Bow and Bromley Liberal and Radical Association for a short time, and joined the Social Democratic Federation in 1892. He was elected Guardian in Poplar, and borough councillor in 1903. He has contested Waltham, Bow, and Bromley, and Middlesbrough for Parliament, as a candidate of the Social Democratic Federation, the Independent Labor Party. He is a member of the Royal Commission on Poor-Laws, also of the Central Unemployment Body, and chairman of the Working Colonies Committee. He established the first labor colony at Hollesley Bay, Suffolk, and was largely instrumental in the establishment of the first poor-law colony at Laindon, Essex. His interest in all kinds of philanthropic endeavors is manifested through membership in Independent Labor Party, Christian Social Union, and by being treasurer of the Poplar Labor Representation Committee. Address: 103 St. Stephen's Road, Bow, E. London.

LASSALLE, FERDINAND: German Socialist leader; born in 1825 at Breslau, Germany, of wealthy Jewish parentage. He studied at Breslau and Berlin, devoting himself to philosophy. Humboldt called him "Das Wunderkind." Savigny called him "Das System der erworbenen Rechte" (1861) "the ablest legal book since the sixteenth century." At Berlin, Lassalle, becoming a great favorite, in 1845 met the Countess Hatzfeldt, and for some eight years defended her cause before thirty-six tribunals on a question of property. In the Revolution of 1848, as an ardent republican, he was indicted for treason at Düsseldorf, and imprisoned six months. On coming out of prison, he devoted himself to literary and philosophical work, living, however, completely as a man of the world. In 1854 the Hatzfeldt affair was settled, and Lassalle gave himself to the completion of his "Die Philosophie Herakleitos des Dunkeln von Ephesus," which he published in 1858. He was now to enter on his Socialist career. Having lectured on constitutional themes, Lassalle was invited to lecture, on April 12, 1862, before an Artizans' Association in Berlin. It has been called the birthday of German socialism. He traced philosophically and historically the development of the State and of society, and argued that as the French Revolution freed the third estate, so the Revolution of '48 meant the freedom of the fourth estate. When the lecture was printed, the whole edition of 3,000 copies was seized, and Lassalle prosecuted for incendiary utterances. He defended himself, appealing to science, but was condemned to pay a fine. Lassalle then threw himself into social agitation of every kind. He corresponded with Rodbertus (q. v.), but could not draw that philosopher from his books. In 1863 the Leipzig Workingman's Association was undecided whether to follow the cooperative movement of Schulze-Delitzsch (see COOPERATIVE BANKS) or a more radical social policy. It now wrote Lassalle, calling on him to outline a policy; and he did so in an "Open Letter," which has been called the charter of German socialism. Lassalle advocated the formation of cooperative societies with state aid. He was invited to appear, together with Schulze-Delitzsch, before the Leipzig workmen, to advocate their respective plans. Schulze-Delitzsch did not appear,

but Lassalle did; 1,300 delegates were present. Lassalle delivered two addresses, and after forty delegates had left the hall cheering for Schulze-Delitzsch, the rest voted for Lassalle, 400 to 1. This led to the organization, May 23, 1863, in Leipsic, of the Allgemeiner Deutscher Arbeiterverein (Universal German Workingman's Association), which was destined to grow into the Social Democratic Party of Germany. Into this movement Lassalle put all his energy. The apathy of the working men was his chief obstacle, but he succeeded in rousing them. He made speech after speech, wrote tract after tract, held meeting after meeting. All the time he was fighting in the courts prosecution after prosecution, defending himself, and usually winning. Berlin, Leipsic, Frankfurt, and the industrial centers on the Rhine were the chief scenes of his activity. His greatest success was on the Rhine, where, in the summer of 1863 and 1864, his travels as missionary of the new gospel resembled a triumphal procession. He claimed that he had converted the king, Bismarck, and Bishop von Ketteler, of Mayence (q. v.). Bismarck certainly received this remarkable man into his friendship, a friendship which may be regarded as historic because of its political results. (See BISMARCK; GERMANY.)

The task of winning Berlin over seemed an impossible one; but Lassalle loved difficulties. "Berlin *must* be mine," he wrote, "before six months are passed. I will invest it. Let me only have 200 working men and I shall have 2,000, and soon the whole of them." Already he had prepared the way for operations by the circulation of 16,000 copies of an "Address to the Working Men of Berlin," in which he endeavored to show that the Progressists were unmanly the artisan; he also sought support for his Productive Associations. Two principal factors played against Lassalle's prospects of success in Berlin. The one was the predominance of the Progressist Party, which controlled the press, and the other was the hostility of the police. It is not a little singular that Lassalle was perpetually being denounced as a tool of the reaction, while at the same time the emissaries of the law were ever dogging his steps and serving him with indictments for high treason.

At the end of June Lassalle was compelled to recruit his strength in Switzerland, and he remained absent from the scene of agitation until September.

The association did not make the progress which Lassalle had expected. In August, when it had existed a quarter of a year, the members only numbered between 900 and 1,000, Hamburg and Harburg having together 230; Elberfeld, 223; and Leipsic, 150, while Berlin had only 20. Lassalle had already shown that he was discouraged, but he urged his followers to fresh energy. During the winter of 1863-64 Lassalle's time was divided between the work of his association and an extensive series of disputes with law courts and official bodies. In Jan., 1864, he produced a volume of nearly 300 pages against Schulze-Delitzsch, in tone undignified, sometimes coarse, yet always strong. But Lassalle's main work was for the association. In Aug., 1864, however, he went for a vacation to Switzerland, and found there a Fräulein von Donnegis, whom he had met previously; they became betrothed. As she was induced by her parents to reject him, he fought

a duel over her and was wounded, and died the night of Aug. 30-31. He was buried, amid the universal lamentations of the working men, in the Jewish cemetery at Breslau. The Countess Hatzfeldt was at his side when he died, and continued to aid the association after his death. There was some division, but the association grew till it joined the movement organized by Marx, and with it formed the Social Democratic Party of modern Germany.

But his death in itself worked for socialism. It created the greatest interest. Heine called him the Messiah of the nineteenth century. The people called him the Father of Social Democracy. Until Lassalle entered public life the working classes had been without organization, and had wandered about like sheep without a shepherd. Thus the more advanced organizations which followed the Universal Association owe their existence and success largely to his almost unaided exertions.

Lassalle did not lay claim to any special originality as a socialistic thinker, nor did he publish any systematic statement of his views.

His Views

His aim was not scientific or theoretic completeness, but the practical one of organizing and emancipating the working classes; and his plans were promulgated in occasional speeches and pamphlets, as the crises of his agitation seemed to demand. Yet his leading ideas are sufficiently clear and simple. Like a true Hegelian, he saw three stages in the development of labor: the ancient and feudal period, which, through the subjection of the laborer, sought solidarity without freedom; the reign of capital and the middle classes, established in 1789, which sought freedom by destroying solidarity; and the new era, beginning in 1848, which would reconcile solidarity with freedom by introducing the principle of association.

His chief insistence was on what he called and has since been called (*q. v.*) "the iron law of wages," a simple development of Ricardo's teaching. He argues:

The simple workingman who has only his two hands possesses nothing unless he is able to sell his labor to others. He may sell it cheap or dear, but the price, more or less high, does not depend on himself alone; it is the result of the bargain he makes with his employer. This latter pays as little as he possibly can, and since he can choose from among a vast number of laborers, he prefers the one who will work at the lowest rate. The laborers are thus obliged to lower their prices in competition with one another. In every kind of labor it must therefore result—and such is actually the case—that the wages of the laborer are limited to the exact amount necessary to keep him alive.

He was not a force revolutionist, and hence his immunity in the courts.

LATIN AMERICA (For statistics, see POPULATION; AGRICULTURE; FINANCES; RAILROADS; POSTAL SERVICE, etc.): Latin America may be said to include the vast majority of Central and of South America. From the standpoint of social reform in the past and present, the countries of this vast region, perhaps, scarcely merit individual notice in a compact work; yet from the standpoint of the future they give promise of being of great significance. Those who have most studied the subject believe that Latin America is on the verge of a forward movement which will astonish the world.

I. Central America

Few people have a correct impression of the size of Central America. If Central America were lifted up bodily and laid down on our Atlantic Coast it would hide all New England, New York, Pennsylvania, and New Jersey. In short, it has a combined area of approximately 167,000 sq. m. Individually, aside from Salvador, already mentioned, the states could be compared as follows: Honduras to Pennsylvania, 45,000 sq. m.; Guatemala to Mississippi, 47,000; Nicaragua to New York, 49,000; Costa Rica to Vermont and New Hampshire, 18,000. As to population, Salvador, with only 7,000 sq. m., has more than 1,000,000 inhabitants; a density of population far greater than that of New Hampshire or Vermont. Guatemala has probably now nearly 1,500,000, a density of population greater than that of Louisiana. Honduras has the largest area of unused country, with Nicaragua next, but the development of the banana industry and the demand for valuable timber grown in the low interior sections are destined to make every unknown part accessible and open to exploitation.

Too strong emphasis cannot be placed on the varied riches and possibilities of these five republics. Taken as a whole, they possess more agricultural and timber wealth than mining potentialities, but they are developing rapidly along all three lines.

The number of recent disturbances in Central America has given the impression abroad that these nations are always in a state of strife, and hence that commerce and material progress have little to encourage them. A consideration, however, of the figures of their foreign trade with the world at large, and with the United States in particular, demonstrates that despite warlike struggles at frequent intervals they have time and money to do a very fair business with the outside world.

Concerning climate, large sections are located either at such an altitude or in such relation to prevailing winds that the temperature seldom becomes too hot for ordinary comfort, and never too cold. Even in the lower and so-called fever, malarial, and mosquito districts, it is wonderful what a change can be wrought by clearing away the jungle, providing good sewerage, pure water, and general sanitary conditions.

If one assumes that because there are occasional revolutions in Central America and the climate is somewhat tropical, there is not a considerable element of highly educated and refined men and women in the chief cities and towns, he labors under great error. A large proportion of the well-to-do people have traveled abroad and send their sons or daughters to the U. S. and Europe for educational advantages in addition to their home schools. Each country has produced writers, historians, poets, novelists, jurists, doctors and surgeons, as well as statesmen.

Guatemala City, for instance, is a remarkable capital, with nearly 100,000 people, which will become a popular point for travelers and tourists from the U. S. when the Pan-American Railroad or the new line from the Caribbean shore is completed. In fact, Guatemala has a splendid future before it, but the world has only recently begun to appreciate its resources and possibilities. Much might also be said of the conditions and attractions of the other Central American capitals like San José, Managua, Tegucigalpa, and San

Salvador, but there is not space in this brief article.

The total foreign commerce, exports and imports, of the five republics amounted last year to the considerable total of \$56,133,000. Of this, exports were \$32,170,000 and imports \$23,963,000, or a favorable balance of nearly \$10,000,000. The share of the U. S. in the above trade is interesting to note, because it averaged about half. The total was \$26,376,000, of which exports to the U. S. were \$14,992,000, and imports from the U. S. \$11,384,000.

Some of the principal articles which are exported and imported: Central Americans sell abroad coffee, bananas, rubber, cacao, dyewoods, valuable lumber, like mahogany and other cabinet woods, hides and skins, rice, sugar, indigo, balsam, tobacco, and minerals. They buy cotton and woolen cloth, machinery, railway, electric, and mining outfits, wheat flour, drugs, and medicines, iron and steel manufactures, sacks for export of coffee and fruit, canned provisions, and a host of lesser articles.

Industrial conditions are yet largely undeveloped. Wages are low; labor ineffective, and general education backward; yet the characteristic fact on all these lines is the making of a new life.

II. South America

South America is distinctly the land of tomorrow. It is a continent of vast and varied possibilities. The traveler and the scholar or the merchant and the promoter will find its peoples, problems, and potentialities of impelling interest. And yet the ignorance prevailing generally throughout the United States in regard to this great southern continent is almost appalling. More attention is given by the press of Europe to South America in a week than by all the papers of the U. S. in a year.

How many people realize that Brazil could completely cover the U. S. proper and still have room for another New England, New York, Pennsylvania, and Virginia combined? That out of the Amazon River flows every day three times the volume of water that flows from the Mississippi, and out of the Parana twice that of the North American queen of waters. These great South American streams afford incomparable opportunities for interior navigation and the development of commerce.

In Argentina, located in the south temperate zone, with a climate like that of the U. S., could be placed all that part of our country east of the Mississippi River plus the first tier of states west of it.

Bolivia is comfortably half a dozen times larger than the combined areas of New York, New Jersey, Pennsylvania, and Delaware.

Peru would obscure, if placed over them on the map, California, Oregon, Washington, Nevada, Arizona, Utah, and Idaho.

Paraguay is four times bigger than Indiana, while little Uruguay could wrap within its limits North Dakota.

Texas could be lost twice in Venezuela and still leave room for Kentucky and Tennessee.

Buenos Ayres, the capital of Argentina, is the largest city in the world south of the equator; it is the second Latin city, ranking after Paris, in all the world; it now has a population of 1,100,000 and is growing faster than any city in the U. S. excepting New York or Chicago.

A mistake is frequently made in considering the climate of our neighboring continent. Because it is called *South America*, the general supposition seems to be that it is all hot.

It is not remembered that vast sections of Colombia, Venezuela, Ecuador, Peru, and Brazil possess wide-reaching high plateaus where, on account of the elevation above the sea, the temperature is so equable and favorable that there can be grown all the products of the temperate zone. Altitude effects a very remarkable physical phenomenon in climate. If a man standing on the equator, at sea-level, mounts a mule and rides straight up into the mountains for 5,280 feet, or one mile, he will experience as great a change of temperature and vegetation as if he traveled 1,500 miles due north by land or sea.

The foreign commerce of South America tells a convincing story. The total foreign trade—exports and imports—of the ten independent South American republics—Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay, Venezuela—and of the British, French, and Dutch Guianas, exceeded in 1905 the sum of \$1,200,000,000.

When one speaks or writes of Brazil, he has difficulty in finding adjectives which will describe truthfully the opportunities in that country. The simple facts—that Brazil covers a greater area than the U. S. proper; that out of the Amazon River every day flows three or four times more water than out of the Mississippi; that this gigantic stream is navigable for thousands of miles; that the city of Rio de Janeiro, its capital, has now a population of 800,000 and spent more money last year for public improvements than any city of the U. S., excepting New York; and that to-day the central government and the different states are expending larger sums for harbor and river improvements than the government or states of the U. S.—indicate its resources.

All over Brazil new towns and cities are springing up. Back in the interior, which has heretofore been described as a jungle, are being found mountains of iron and coal and forests of valuable timber, upon which the world must largely draw for its supply in the future.

Argentina is, however, the wonderland of South America. In the year 1906 it carried on a foreign trade, exports and imports, amounting, in all, to \$562,000,000. This, tho true, seems almost incredible when we realize that the country has yet only about 6,000,000 people. The Argentine Republic, with a comparatively small population, carries on a larger foreign commerce than Japan with 40,000,000 or China with 300,000,000 of people. Her trade with the rest of the world is nearly \$100 per head, or proportionately greater than any other country.

The railway systems of the republic rival, in proportion to population, the railroad systems of the U. S. and European countries. The cities of the interior are growing rapidly, and the vast agricultural possibilities of her plains and the mineral wealth of her mountains seem almost limitless.

South America is undoubtedly entering upon a new industrial and material movement. Its development during the next ten years will arrest the attention of the world. Its mining wealth and resources alone, especially those of gold, copper, silver, tin, platinum, and nitrate in the Andean states of Colombia, Ecuador, Peru, Bolivia, and Chile, are of immeasurable value.

A recent issue of a Berlin financial paper estimated that \$2,000,000,000 would be invested during the next decade in South American railways.

All over South America elaborate programs for new roads are being worked out. Argentina is already gridironed with excellent systems. Chile is pushing lines in all directions. Brazil is preparing to penetrate her vast jungles and connect distant points with Rio de Janeiro. Bolivia is spending more than \$50,000,000 in new work, while Colombia, Ecuador, Peru, Uruguay, Paraguay, and Venezuela are considering various practical and needed plans for new construction.

There is no limit to the demands upon capital for legitimate railway-building, electric tramways, electric lights, water-works, factories, sewerage works, telephone and telegraph systems, agricultural extension, stock-raising, and kindred undertakings.

Immigration is pouring into Argentina, Brazil, Uruguay, and Chile.

While the Spanish language is the common tongue of all South America except Brazil, it must be remembered that the latter has a

Industrial Development population of nearly 20,000,000 and occupies nearly half the area of the continent. Portuguese is spoken throughout its limits, and Spanish is seldom heard among its people.

Industrial conditions are more advanced than in Central America, and yet leave much to be desired.

Mr. John V. Noel, late chief of the Latin-American press section at the Pan-American Exposition, writes of the social conditions in *Social Progress* (1905):

Generally speaking, there are in the Latin-American countries two classes: the governing and the governed. The former are not inclined to grant reforms unless compelled to. The latter have not reached, as a rule, that condition of intelligence or freedom to demand or force legislation for their betterment and protection. The lower classes, especially the majority of those millions of Indians who constitute the numerical force in Mexico, Central and South America, are victims of the peon system and slaves to all purposes, according to our standards. Oppressed from the days of Spanish conquerors, they have been stoical and happy in their fashion, careless of the morrow. Climatic conditions have thereon a direct bearing. The stern realities of life do not influence them in lands where starvation is impossible and where a few palm-leaves furnish shelter. Occasional outbreaks from this passive and contented attitude take place, such as the dock strikes at Valparaiso, Chile, or the cigarmakers at Havana. It may be stated in a general way that the people, meaning the masses, have not come to realize the necessity for improvement in their methods of living, sanitation, customs, and general surroundings, or have never broached the question as to whether they are receiving a fair share of the general purse in return for their contribution of labor.

There is a constantly growing tendency, however, among those whom the accident of birth and blood or of political fortune has placed in a commanding position to adopt modern ideas and champion measures which experience in older countries has suggested—a tedious and thankless task, which the apathy of the people in general and Spanish-inherited procrastinating tendency emphasizes. In the matter of sanitation, great improvements, however, have been made. The severe pure food laws rigidly enforced in the Argentine and other Latin-American countries may well serve as an example to other nations. In Chile the standard of education is very high, and an educational congress and school exhibit, held in the early part of the year, reflected great credit upon that progressive nation. In all countries there are, however, earnest men and women working courageously and trying to give light and educate their people in many reformatory efforts, such as sanitation, prevention of cruelty to children and animals, moral customs, and in general for a higher standard of living and thinking.

See article INTERNATIONAL BUREAU OF AMERICAN REPUBLICS; which bureau can supply further information.

LAUGHLIN, JAMES LAURENCE: Economist; born Deerfield, Ohio, 1850. Was educated at Harvard University, and appointed instructor in political economy in that university in 1878, becoming assistant professor in 1883; 1888-90 was president of the Philadelphia Manufacturers' Fire Insurance Company. In 1890 became professor of political economy and finance at Cornell, and in 1892 head professor of political economy at the University of Chicago. Member of the Monetary Commission, 1898. He is known as an advocate of gold monometalism, and as a leader among the more conservative economists of the United States. He is author of "Anglo-Saxon Legal Procedure"; "The Study of Political Economy"; "The History of Bimetallism in the U. S."; "The Elements of Political Economy"; "Principles of Money" (1903); "Reciprocity" (1903); "Industrial America" (1905). Address: 5747 Lexington Avenue, Chicago, Ill.

LAVATORIES in economic and hygienic science are the euphemism for the public convenience of water-closets and urinals provided in most European cities, altho, strictly speaking, the lavatory is that part of the convenience provided with set bowls, soap, and towels. They are usually free, but in some cases a small fee is charged for the use of these conveniences, and frequently those charging the fee are self-supporting. Paris and other continental cities provide urinals on the sidewalk or in small buildings.

Many of the conveniences in London are underground. An ornamental iron railing, an inscription tablet, and a lamp are the indications of the convenience. That in Piccadilly Circus, in front of the "Criterion," is one of the largest. The estimated number of people using this convenience in one year is 5,000,000. The initial cost was about £3,500. The fee is generally a penny.

To avoid any hesitancy in visiting a public convenience London has *ladies' châlets*. These are built in open sites in the parks or at the junctions of streets. It is also a part of the scheme that they shall be self-supporting.

This kind of a convenience is divided into two parts—a shop for the sale of millinery or small notions and the lavatory, the entrance to which is through the shop. It was found that the accommodations for men were much more ample than for the women, hence it was hoped that the châlets would obviate that difficulty. The expense of these conveniences is about £400, and it is calculated that each will yield a rental of £12, which amount defrays the interest on the cost, while the income from the lavatory meets the operating expenses with a possible margin of profit, dependent on the location. A parcel room is often an additional adjunct of this system.

LAVELEYE, ÉMILE LOUIS VICTOR DE: Professor; writer; born Bruges, 1822. Studied at Bruges, the Collège Stanislas in Paris, and the University of Ghent. In 1865 became professor of political economy at Liège University. In politics a Liberal, in religion a liberal Roman Catholic. He was a constant contributor to the *Revue de deux mondes*, and a voluminous writer. Among his best-known books are his works on agricultural economics and on bimetallism—e. g., "La Question d'or"; "De la propriété et de ses formes primitives," translated into English by G. S. Mar; "Socialisme contemporaine." Died

Jan. 3, 1892. Laveleye was considered a liberal academic Socialist.

LAWRENCE, FREDERICK WILLIAM PE-THICK: English barrister-at-law, journalist, Socialist; born 1871; educated Eton and Trinity College, Cambridge. Fellow of Trinity, 1897; visited India, Australia, New Zealand, China, Japan, and United States of America; lived in the Mansfield House, University Settlement. Went to South Africa, 1900; on return became honorary secretary of South African Women's and Children's Redress Fund; obtained a controlling interest in the *Echo*, and edited the paper 1902-5; editor of the *Labor Record and Review* and "The Reformers' Year Book." He is author of "Local Variations in Wages" (joint); "The Heart of the Empire." Address: 87 Clement's Inn, Strand, W. C., London, England.

LAWSON, SIR WILFRID: Temperance reformer; born 1829, son of Sir Wilfrid Lawson, of Aspathria, Cumberland, and succeeded to the title and estates of his father, who died in 1867. A lifelong advocate and supporter of the temperance movement, he became its chief representative in Parliament, being elected for Carlisle in 1859. In March, 1864, he first moved for leave to introduce the measure known as the Permissive Bill, the main principle of which is the giving to two thirds of the inhabitants of any parish or township an absolute veto upon all licenses for the sale of intoxicating liquors granted within their districts. The bill was supported by forty members. At the general election of 1865 he was defeated, but was successful as a supporter of Gladstone in 1868 and represented Carlisle until 1885. He succeeded, in 1880, in carrying his "Local Option" resolution by a majority of twenty-six. In 1885 he stood for the new Cockermouth division of Cumberland, but was defeated. In 1886, as a Gladstonian Liberal, he gained the seat by a large majority, and again in 1892 and 1895, but was defeated in 1900.

He was president of the United Kingdom Temperance Alliance, and active in all temperance work. He died in 1896.

LEAGUE OF AMERICAN MUNICIPALITIES: Organized Oct. 28-30, 1907. The objects of the League of American Municipalities are: The general improvement and facilitation of every branch of municipal administration by the following means: First. The perpetuation of the organization as an agency for the cooperation of American cities in the practical study of all questions pertaining to municipal administration. Second. The holding of annual conventions for the discussion of contemporaneous municipal affairs. Third. The establishment and maintenance of a central bureau of information for the collection, compilation, and dissemination of statistics, reports, and all kinds of information relative to municipal government. The membership of the League includes nearly all of the important cities in this country and Canada. Secretary, John MacVicar, 18 Broadway, New York.

LEAGUE FOR THE TAXATION OF LAND VALUES, THE ENGLISH AND THE SCOTCH: The English League for the taxation of land values is the name adopted in 1902 by the Land Restoration League (which see). The league was at that time reorganized. The object of the league is explained in its title. At the general

election, Jan., 1906, sixty members of the league stood as candidates, of whom forty-five were successful. The president of the league has promoted a Sessional Committee for the advocacy of the taxation of land values, which has been joined by about 280 members. Draft clauses for the valuation of land have been prepared, and submitted to the government. At the suggestion of the committee, the government has issued as a White paper a translation of Prussian State documents as to the introduction of the Assessment Real Estate on the basis of its market value for local purposes. The league has an organ, *Land Values* (1d.), published monthly in connection with the Scotch. Its President is J. H. Whitley, M. P.; General Secretary, Frederick Verinder, 376 and 377, Strand, London, W. C.

The Scotch League for the taxation of land values was until 1904 carried on under the name of the Scottish Single Tax League. There is also a league in Edinburgh. Hon. secretary, G. D. Valentine, 13, Pitt Street. During the general election the league published half a million copies of "Land Taxation" leaflets and questions to candidates. It uses the paper *Land Values*, with the English league. Its President is James Fairlie (Falkirk). Secretary, John Paul, 13 Dundas Street, Glasgow.

LEASE, MARY E.: Lecturer and writer; born Ridgway, Pa., 1853; removed to Kansas and was admitted to the bar 1885. Entering politics in the interests of the UNION LABOR PARTY and the Farmers' Alliance, she made 161 speeches in the campaign of 1900, resulting in the election of William A. Peffer as United States senator and defeating Senator Ingalls. She was appointed President of the State Board of Charities. In 1903 she was strongly supported for the position of United States senator. She has since that date mainly given her attention to magazine articles on economic and political themes. She is author of "The Problem of Civilization Solved" and numerous articles. Address: 80 East 121st Street, New York.

LECLAIRE, EDMÉ JEAN: Introducer of profit-sharing; born 1801; at the age of seventeen he arrived penniless in Paris; became a journeyman house painter; 1827 set up on his own account, and was successful; 1834 was chosen to paint the Bank of France and other large buildings. By a series of experiments he learned how to avoid the use of poisonous white lead. Feb. 15, 1842, Leclaire announced his intention of introducing a system of profit-sharing among his men. He was laughed at and suspected by his men; but when he divided 12,266 francs among them—\$50 on an average to a man—they ceased to laugh; 1842-47 an average of \$3,750 was divided among about eighty men; 1838 he established a mutual aid society among his men; 1853 he organized a complete system of profit-sharing; in 1860 established a system of old-age pensions; 1864 the society became incorporated as the Mutual Aid Society. In 1865 Leclaire retired and became *maire* of Herblay, where he died July 10, 1872. The month before his death the Maison Leclaire divided \$10,000 between about 600 men. The society still lives. (See PROFIT-SHARING.)

As with many who have applied genius to philanthropy, the fountain of Leclaire's enthusiasm was essentially religious, tho of a kind un-

connected with the special dogmas of any particular Christian body. How intensely he held the "great commandment" of Christian morality appears from the following words written in sight of death, when he felt "sincerity" to be "more than ever a duty":

I believe in the God who has written in our hearts the law of duty, the law of progress, the law of the sacrifice of one's self for others. I submit myself to His will, I bow before the mysteries of His power and of our destiny. I am the humble disciple of Him who has told us to do to others what we would have others do to us, and to love our neighbor as ourselves; it is in this sense that I desire to remain a Christian until my last breath.

LECLAIRE, ILL.: A cooperative village at Edwardsville, Ill., near St. Louis, Mo., founded in 1890 by Mr. N. O. Nelson (*q. v.*), the millionaire cooperator of St. Louis, for the employees in his factory (for making plumbers' supplies).

Leclaire differs from almost all "model villages" in the extent to which Mr. Nelson has induced his employees to develop their own homes, rather than to depend on him to create a village for them. As a true Tolstoyan, Mr. Nelson would have no compulsion, and not much leading. He has simply himself lived among his employees, conducted his own business firmly, built his own attractive and practical house, developed his own garden; and has shown his employees how they could go and do the same, out of their wages. Leclaire differs, too, from most other model villages in that it sells lots outright, on the instalment plan, to the employees, and then allows the employee landowner, subject to a very few restrictions, to do what he will with his own. Tho the houses are not all, and the place is not all, quite so artistic as it might be otherwise, it is free, and has the grace of freedom and variety, and lack of artificiality and stiffness. There are some 100 houses in all (only 12 rented, the rest belonging to the employees). The houses average 26 by 33 feet, on about one third of an acre. They are mainly wood, and usually of one story. The rented houses rent for \$10 to \$13 per month, and the land is sold for from \$2 to \$2.50 per front foot. It shows what well-treated American workmen will do for themselves with homes and gardens, when given the opportunity. Cooperation has developed a club-house, bowling-alleys, billiard-rooms, tennis courts, school, kindergarten, industrial school, library, and public hall.

LEDNICKI, ALEXANDER: Russian-Polish journalist and politician; born in 1866. He is a graduate of the college of Minsk and of the Demidoff Law Lyceum (1889); was admitted to the Moscow bar, and became a member of the Lawyers' Council (1904). He represented Minsk in the first Duma where he joined the Constitutional Democrats, and soon became the most prominent and radical member of this party from Poland. He is chairman of the Moscow Society for Popular Amendments, of the Polish Benevolent Society, and a contributor to the newspapers, notably to *Russkaya Mysl* (Russian Thought), *Ruskiya Viedomosti* (Russian News), and others.

LEE, ALGERNON: Editor of *The Worker*; born Dubuque, Iowa, 1873; educated in public schools, Fiskill, N. Y., Minneapolis, Minn., and University of Minnesota; has been actively connected with the Socialist movement since 1895; delegate to National Convention of Socialist Party at Chicago, 1904, and to International Socialist

Congresses at Amsterdam, 1904, and Stuttgart, 1906. Mr. Lee is a member of the National Committee of the Socialist Party for 1906; he is a Socialist of the strict party type; has been editor of *The Worker*, Socialist weekly paper, since 1899. Address: 15 Spruce Street, New York.

LEE, H. W.: General secretary of the Social Democratic Federation; born 1865 in London. In 1883 he attended a meeting of Bradlaugh's and read "Socialism Made Plain"; both events were causes for joining the Social Democratic Federation. He gave up his employment to become assistant secretary of the Federation in Aug., 1885, under Champion, and was elected general secretary a few months later. He has completed twenty-one years in that office, and has declined municipal or parliamentary honors, since he enjoys his present work and gives it his whole attention. Address: 21a Maiden Lane, Covent Garden, W. C., London, England.

LEIPZIGER, HENRY M.: Supervisor of Lectures, New York City Board of Education; born Manchester, England, 1854; attended Manchester Grammar School, but coming to America in 1865, was educated in the public schools and the College of the City of New York; studied law at Columbia Law School, graduating LL.B. in 1875. Early took a deep interest in associations of a philanthropic and cultural character, especially public libraries and young men's associations. Devoted much study to industrial education; in 1884 selected to organize the Hebrew Technical Institute, one of the pioneer schools for instruction in the manual arts in the United States. Received in 1888 the degree Ph.D. from Columbia University. In 1890 was commissioned to organize the public lecture system of New York, a work which has expanded until it is now become practically a thoroughly organized system for the education of adults. The system is being adopted in other cities. Chairman, 1887-1903, of the Aguilar Public Library. Dr. Leipziger believes that true social reform comes best through the diffusion of education, and that the schoolhouse should therefore become a social and civic center for the adults as well as the children of the community. He believes also that social reform will be largely advanced by adapting the school to the "all round" training of the child by the State maintaining technical and trade schools as well as the so-called English and classical schools. Address: Board of Education, New York.

LEO, VICTOR: Imperial councilor and member of the Imperial Statistical Office in Berlin; also of the International Statistical Institute, and officer of the Legion of Honor. He was born Nov. 9, 1871, in London, England, but studied in the universities of Berlin, Freiburg, Rome, and also in Paris; received the degree of Ph.D., and after passing the civil service examinations from 1892 to 1897, became a member of the Imperial Commission to the Paris Exposition of 1900. In 1902 he entered upon his present position and became editor of the *Reichs Arbeitsblatt*. Politically he is a conservative and believes that the State should assist wherever men are not able to help themselves. He is the author of "Die Anklagen gegen die Goldwährung" (1901); "Entwicklungstendenzen des Welthandels" (1901); "Der Staat und die Kartelle" (1902);

"Deutschlands Welthandelsstellung im Bild" (1904); "Die Versicherung gegen die Folgen der Arbeitslosigkeit" (1906). Address: Grunewald, Berlin, Germany, Parkstrasse 26.

LE PLAY, PIERRE GUILLAUME FREDERIC: Sociologist; born at La Ravière, Saint Sauveur, in 1806. Deeply impressed with the sorrows of the poor around his early home, he came to Paris to study in the École Polytechnique. Graduating with honors, he started, in 1829, with Reynaud, and traveled for many years through all Europe studying social facts. In 1840 he was appointed to the chair of metallurgy in the School of Mines, and later was Inspector-General of Mines. Coming under notice of the emperor, he was repeatedly appointed head of various scientific expeditions, particularly that of 1867. In 1855 he published "Les ouvriers européens." In 1856 he founded "La société internationale des études pratiques d'économie sociale." In 1864 he published "La réforme sociale en France déduite de l'observation comparée des peuples européens"; in 1870, "L'organisation du travail." In 1872 founded "Les unions de la paix sociale" which, in 1890, had 3,000 members. In 1881 commenced "La réforme sociale," the organ of these unions. In its first number it declared that France, in the present century, had had eleven revolutions and nineteen successive constitutions, as the result of utter chaos in social ideas. Hence it argued the need for conclusions drawn from the patient study of facts. Le Play is often called a Liberal Christian Socialist; yet, tho a Roman Catholic, he does not emphasize religion, and is as opposed to socialism as to *laissez-faire*. He simply desired truth drawn from facts, and set himself and his followers to collecting these. His remedy for social ills is a rehabilitation of the powers once vested in the father of a family and in the conductor of a workshop. The family organization is not to be patriarchal, but what he calls the *famille souche*, with a restoration of the now limited freedom of bequest. H. Higgs has written the best English account of Le Play in the *Quarterly Journal of Economics*, Boston, July, 1890.

LEROY-BEAULIEU, PIERRE PAUL: Journalist; economist; born 1843, at Saumur; studying in Paris, Bonn, and Berlin, he traveled extensively in England and on the Continent, and held editorial positions upon the staff of several prominent journals and magazines; was professor of finance in the School of Political Science. In 1880 succeeded Michel Chevalier at the Collège de France. Leroy-Beaulieu is an adherent of the liberal school. His chief work is his "Traité des sciences des finances," the best French work on the subject, and full of learning and research. He is also well known for his "Le Collectivisme"; "La répartition des richesses"; "L'état moderne et ses fonctions". He is the editor of *L'économiste Française*. Address: Avenue Bois de Boulogne 27, Paris, France.

LESLIE, THOMAS EDWARD CLIFFE: Professor of jurisprudence; born in Ireland in 1837. He was called to the English bar, but turned his attention to literature, and contributed to the quarterly magazines. Professor of jurisprudence and political economy in Queen's College, Belfast, for twenty-five years. Died in 1882. Cossa says of him in "Introduction to Political Economy":

His learned and eminently readable tracts on applied economics all take up questions of reform, and he is especially pointed in his arguments against indirect taxation, and in favor of emancipating land tenure from the last remnants of feudal bondage. His schooling was partly under Sir Henry Maine and partly acquired by his own frequent and extended travels. By this means he acquired convictions regarding the historical development of economics which led him to take a position unique in Great Britain, where he was for a long time the solitary and always the most enthusiastic adherent of views which Roscher and Knies defended in Germany. The manuscript of his most extensive work was lost in 1872, so that all that we now have to represent him is scattered through various reviews in the shape of essays. . . . He rejects in so many words the fundamental principle of the classical schools—their conception of the desire for wealth upon which all their deductions depend—because it is at one and the same time too vague and too one-sided.

LEVASSEUR, PIERRE ÉMILE: Political economist; born in 1828, at Paris, France; educated at Bourbon College, later known as Lycée Bonaparte; entered the Normal School in 1849; from 1852 to 1854 was assistant professor of the Lycée d'Alençon. After this was professor of rhetoric at Besançon. Appointed professor of history in the Lycée Napoléon at Paris in 1861. Member of various scientific societies and of the Committee on Historical Works, was elected in 1868 a member of the Academy of Moral and Political Science in place of M. Duchatel. Since 1876 has occupied the chair of history and economics and of geography in the Collège de France, and the chair of statistics and economic geography in School of Political Science, and has taken part in all international congresses of statistics held in Europe during recent years. Member of the Section of Agricultural Legislation, Société Centrale d'Agriculture, president of the Commission of Statistics and Primary Education, and an officer of the Legion of Honor. Dr. Levasseur has won consecutively three competitive prizes of the Academy of Moral and Political Sciences for papers on historical and economic questions relating to the working classes in France. Author of a number of valuable contributions to economic magazines and reviews. He is best known by his almost encyclopedic work upon the "Condition of the Working Classes in France Before and Since the Revolution." Address: Collège de France, Paris.

LEVELERS, THE: A radical party in the army of the Long Parliament, formed when the army had overawed Parliament and sent Charles I. to Hampton Court in 1647. The reforms proposed by it included the leveling of all ranks and the equalization of all titles and estates in the whole kingdom. Some of the officers were cashiered in 1649, but the party continued its propaganda after Cromwell's departure for Ireland and raised mutinies in the army. Their organ, *The Leveler*, demanded in *politics*: (1) The impartial authority of the law; (2) the power of Parliament for legislation; (3) absolute equality before the law; (4) arming of the people for enforcing the law and protecting their liberty. In *religion*: (1) Absolute liberty of conscience; (2) freedom of interpretation and of action according to the dictates of conscience; (3) a distinction in religion between its aspects as revelation—which is a private affair—and as action, which is subject to the temporal authorities; (4) discontinuation of all strife about theological doctrines and forms of worship. The sect was short-lived, and disappeared at the time of the Restoration.

LEVIN, SHMARYA: Russian journalist and Zionist preacher in the synagogue of Vilna; born

1867. He graduated from the College of Minsk in 1886 and from the University of Berlin in 1894 with the degree of Ph.D. Afterward he was a rabbi for a time, but interested himself in politics and represented Vilna at the first Duma, where he joined the Constitutional Democrats.

LIBERAL PARTY, THE (ENGLISH): The following statement by Sir Henry Campbell-Bannerman is reprinted (in brief) by permission from the *World Work*, Chicago, March, 1905:

What is the Liberal policy? Our very name gives the answer. We stand for liberty. Our policy is the policy of freedom. It is the policy of freedom in all things that affect the life of the people, freedom of conscience, freedom of trade, internal and external; freedom of industry, of combination and cooperation; from class ascendancy, from injurious privileges and monopolies; freedom for each man to make the best use of the powers and faculties implanted in him; and with the view of securing and guarding these and other interests, freedom of Parliament, for all to elect to the governing body of the nation the representatives of their own choice.

That is the Liberal policy.

It may accurately be said that there is practically but one great impediment in the way of a sweeping improvement which would elevate the physical and moral welfare of the people. This is the interest, and the overdue regard to the interest, of the landowner, and the political and social influence that he and his class can exercise. Let the value of land be assessed independently of the buildings upon it, and upon such valuation let contributions be made to those public services which create the value.

What is our rating system? It is a tax upon industry and labor, upon enterprise, upon improvement; it is a tax which is the direct cause of much of the suffering and overcrowding in the towns. Overcrowding is not a symptom only, but a cause of poverty, because it demoralizes its victims and forces them to find relief in excesses. By throwing the taxes on site values, communities which have created these values will be set free, free in the sense that they can expand, free to direct their own destinies.

Principles

Foremost among our domestic duties is the succor of the masses who are in poverty. If it can be shown that poverty, whether it be material poverty or poverty of physique and of energy, is associated with economic conditions which, tho supported by the laws of the country, are nevertheless contrary to economic laws and considerations and to public policy, the State can intervene without fear of doing harm. Is there any lack of such conditions among us? I fear not. The country is still largely governed by castes, and it has to compete with nations which have shaken off feudal ways and privileges which we continue to tolerate.

First of all, the whole range of reforms which seem to be necessary in order to simplify and complete our electoral and legislative machinery is the simplification of registration. The abolition of the plural vote, the reduction of electoral expenses, the removal of every bar to the free choice of electors, and, above all, the adjustment of the relations between the two houses of Parliament, are changes which the workingman ought to claim as his birthright. It is these that will give him the power to obtain, with the consent

and cooperation of other classes of the community, changes which he especially desires and demands, without waiting upon the condescending benevolence or the grudging necessities of the hereditary House.

It cannot be too often repeated and enforced that the way to go to work to organize the home market is not the crude and unequal and exploded method of setting up tariffs. It is to raise the standard of living, abolishing those centers of stagnant misery which are a disgrace to our name, and when once the home market is so organized the demand for labor will be larger and more sustained, and more capable of insuring itself against fluctuation.

The wisest course is to attack these bad conditions boldly and fearlessly; to abolish them, or, if we cannot do that, to modify them; deal rigorously with vested interests and monopolies which cause public injury or stand in the way of improvement; enlarge the powers of local authorities, readjust our taxing system, and so alter our land laws as to increase the supply of houses and of available land in towns, and alike equalize burdens local as well as imperial; give—as far as laws and customs can give it—a chance to every man.

The condemnation of the Education Act, as ignoring popular rights, as excluding from their proper share of influence the parent and the taxpayer, the two classes most concerned, and as writing upon the door

Measures

of entry to a great and honorable and beneficent profession a sectarian test—that is a standing condemnation which time can never wither. It must be put an end to as soon as possible, and the public, whose money is taken, and who as patriots and as parents are intensely interested in the character and quality and nature of the education given to children at the most receptive period of their lives, must have the command in this matter, and not any self-constituted body of managers, or any man, whether he be parson or layman.

Another great object will be to improve our land system and our agricultural conditions so as to keep more men on the soil and take others back to it. It is not in our colonies only, and our dependencies across the seas, that we have a great estate to develop; we have it here under our eyes. Let us try the experiment of getting the people on the soil and encouraging them to engage all their energies in its improvement. We must try to get rid of anything that hinders the development of agriculture, restrictions that we have outgrown, and habits that belong to a patriarchal state of things.

There is a general awakening and broadening of view on this subject. There is a growing belief in cooperative methods, both in purchase, transit, dairying, and in the application of scientific processes, in the adoption of what may be called a forward policy to meet the changes and surmount the difficulties which time has brought with it.

I hold that there are three main divisions of operation for the amelioration of the condition of the rural population. First of all, it is necessary to provide healthy, comfortable homes in the country. Secondly, there is the furnishing to the laborer in the country the opportunity of a career, so that by industry and intelligence he may raise himself. Third, there should be freedom in that career.

I stand by my ideal and I object to that of the

past government as to the armaments which we need. The difference between us is crucial and fundamental. I claim that we are not called upon to vie, and it would be the height of folly for us to attempt to vie, with our great military continental neighbors.

It is necessary for our position, for the nature and character of this empire, that we have a very strong navy having full command of the sea. But the increase of our navy estimates has been 90 per cent since 1895. Is this race forced upon us by the ambitions and actions of other powers, or is it in any degree our ambitions, our actions that are forcing it upon them? But there is another line of defense which comes before army and navy, and that is "friendly relations with other countries."

The insane race and rivalry of armament does not conduce to the strengthening of these friendly relations. The authoritative unanimous voice and opinion and direction of all the great powers of the world demanded at The Hague their limitation for the material and moral welfare of humanity. Overtures to this effect have been made and rejected. Let us make them again and again until we succeed. A great step was accomplished for civilization and humanity when a shrine was set up consecrated to the common interests, common conscience, and the common purposes of the human race.

The question of the better government of Ireland directly and imperatively concerns both parties. The principle of self-government, the principle that the elective element shall be the governing element in Ireland, remains, in my view, the only principle consonant with our constitutional habits and practise, and, above all, the only principle that will ever work. Freedom is our key-note. Freedom and equality.

HENRY CAMPBELL-BANNERMAN.

LIBERTY: Few words in the English language are more used in the literature of social reform than the word *liberty*, yet few words have been less carefully defined. What definitions have been given have been often contradictory and often utterly unphilosophical. Cicero says: "The essence of liberty is to live just as you choose" (*potestas vivendi ut velis*) ("De Officiis," Book I., chap. xx.). This is perhaps to-day both the popular and the abstract conception of liberty; but all science, philosophy, and experience agree to-day in declaring that no such liberty is possible to a finite being. The following quotations will show to what an extent modern science denies that there is any freedom of the will:

"I know of no writer not a theologian pure and simple that goes the length of claiming this for the will" (George Lacy, in "Liberty and Law," p. 53). "The terms have no application to the subject" (Bain's "Emotion and Will," chap. xi.). "Man's volitions are not self-caused, but determined by spiritual antecedents, in such sorts that when the antecedents are the same, the volitions will always be the same" (Mill on Hamilton, pp. 492-3). "There is nothing existing in the world which is absolutely alone—entirely free from inseparable relationship to some other thing or things. Freedom, therefore, is only intelligible as meaning the being free from some kind of restraint" (Argyle, "Reign of Law," chap. vi.). "The will of the animal, as well as that of man, is never free" (E. Haeckel, "History of Creation," vol. i., p. 237). "The feelings in my consciousness in the moment of voluntary choice have been preceded by facts out of my consciousness, which are related to them in a uniform manner, so that if the previous facts had been accurately known, the voluntary choice might have been predicted" (W. K. Clifford, "Right and Wrong," p. 162). "Psychical changes either conform to law or they do not. If they do not conform to law, no science of psychology is possible. If they do conform to law, there cannot be any such thing as free will" (H. Spencer, "Principles of Psychology," part. iv., § 20).

Many theologians and some philosophers assert the freedom of the will, but even they usually maintain that the will is only free within the limits of its own moral nature.

Says T. D. Woolsey:

For a finite being, moral excellence, united with the greatest perfection of intellect pertaining to human nature, will make the best course of action certain within his sphere of existence (Johnson's "Cyclopaedia," article "Liberty").

It follows that moral deficiencies and lower grades of intellect make lower causes of action equally necessary. As for experience, from the child who cries for the moon to the absolute monarch or the beggar, who both have their wills continually crossed, all life shows that no man can do whatever he will. Scientifically, philosophically, experimentally, absolute freedom for finite beings is an impossibility.

Says F. J. Stephens ("Liberty, Equality, and Fraternity," p. 13):

Freedom is only intelligible as meaning the being free from some particular kind of restraint; therefore, in political science, when one speaks of political, economic, or other liberty, one should explain from what kind of restraints freedom is meant.

"From excessive liberty tyranny springs as certainly as a tree from its roots" (Plato's "Republic.,").

Economic freedom may not mean liberty, because one may still be the slave of social laws. Hence, in considerations of liberty, freedom must be balanced with freedom, and the greatest amount of freedom chosen. Thus, moved by various considerations and influenced by various social, political, and industrial environments, liberty has been very variously conceived, as the following definitions will show:

"Liberty consists in the safe and sacred possession of a man's property" (Fox, quoted by W. Roscher, vol. i., p. 236). "Political liberty consists in security or, at all events, in the opinion that we enjoy security" (Montesquieu, "Spirit of the Laws," book 12, chap. ii.). "Liberty is the freedom to do what the law permits" (Montesquieu, "Spirit of the Laws," book 2, chap. iii.). Bentham makes liberty to consist in the freedom to follow fourteen specific sources of pleasure, which he names ("Principles of Morals," vol. i., chap. v.). Mill says that liberty "is the principle that the sole end for which mankind are warranted individually or collectively in interfering with the liberty of action of any of their number is self-protection" ("Liberty," on p. 6, People's Edition). According to Sheldon Amos, "Liberty on its positive side denotes the fulness of individual existence. On its negative side it denotes the necessary restraint on all which is needed to promote the greatest possible amount of liberty for each" ("Science of Law," p. 90).

For other conceptions of liberty and a discussion of the ways by which it is proposed to secure to-day the highest amount of liberty, see ANARCHISM; INDIVIDUALISM; SINGLE TAX; SOCIALISM; SPENCER.

LIBERTY PARTY: The abolitionists (*q. v.*) at Warsaw, N. Y., having informally nominated, in 1839, James G. Birney for president and Thomas Earle for vice-president, the nominations were confirmed by a convention, ostensibly national, that met at Albany, April 1, 1840, and adopted the name "Liberty Party." Its platform was the abolition of slavery. The candidates received 7,059 votes in spite of their having declined the nominations. On Aug. 30, 1844, the national convention of the party met. The topic of greatest interest at that time was the annexation of Texas, and the consequent increase in slave territory. Birney and Thomas Morris, of Ohio, were nominated. The total vote for Birney was 62,263. Had the electoral vote of

New York gone to Clay, it would have elected him. In that state the popular vote stood: Polk, 237,588; Clay, 232,482; Birney, 15,812. Had Birney not been nominated, it is probable that enough of his vote to elect Clay would have been so cast—certainly none of it would have gone to Polk. This lesson was not forgotten, and the party did not again name its own candidates. In 1848 and 1852 it supported the Free Soil Party, and thereafter the Republican Party (q. v.).

LIBERTY AND PROPERTY DEFENSE LEAGUE, THE: Founded for the purpose of maintaining freedom of contract, upholding proprietary rights, and resisting socialistic legislation, the Liberty and Property Defense League has from its inception in 1882 occupied a unique position in English politics. Associated with neither of the two great political parties in the state, it has consistently opposed the tendency toward socialism which, during each succeeding year of the last quarter of a century, has become more and more marked in the legislation of the British Parliament.

Federated with the league are 220 defense and protection societies, representing railways, shipping, tramways, water companies, manufactures, land and house property, liquor, mining, and the other industries, and the representatives of these bodies form a powerful committee for the purpose of watching the progress of bills through Parliament, and taking steps to oppose or amend such bills. Chairman, the Earl of Wemyss; offices, 25, Victoria Street, S. W.

LIBRARIES, PUBLIC: Probably the oldest libraries known are the Babylonish tablets, found in the mounds of Mesopotamia, and supposed to have been prepared for public instruction about 650 B.C. Pisistratus is said to have founded a library at Athens 537 B.C., but this is not clear. Strabo says that Aristotle was the first collector of a library, and that his library descended to the Romans. The story of the great Alexandrian library founded by Ptolemy Soter, with from 100,000 to 700,000 manuscripts (according to different authors), and burned by the Caliph Omar, is now considered to be a myth, at least as to its size. Many Romans collected libraries. Plutarch says the library of Lucullus was open to all. Pliny says the library of Pollio was the first public library in Rome. St. Jerome says that St. Pamphilus, of Cesarea, in 309, collected 30,000 volumes, chiefly religious, to be lent; if this be true, it was probably the first lending library. The libraries of the Middle Ages were small. The still existing library of the Swiss abbey of St. Gall was one of the first, and claims an antiquity of 1,000 years. The first library in England is said to have consisted of nine manuscripts brought by Augustine in 596. As late as Henry VIII. the royal library had only 329 volumes. Matthias Corvinus, King of Hungary, had, in 1490, 50,000 volumes, destroyed by the Turks in 1530. Lorenzo de' Medici, in Florence, established the great Laurentian Library. In 1556 the Royal Library of France, then containing 2,000 volumes, received by royal ordinance the privilege of obtaining a copy of every book printed in France. By 1789 it had 200,000 volumes, and is to-day the largest library in the world. Germany has the greatest number of im-

portant libraries of any country. The library of the British Museum was founded in 1753. The first library in the United States was that of Harvard College, begun in 1638.

Benjamin Franklin, after considerable effort, founded, in 1732, the Philadelphia Library Company, the "mother of all the subscription libraries in North America."

In Scotland, in 1816, Samuel Brown, of Haddington, following in part the methods of London booksellers, established a system of free itinerant libraries, loaning without cost packages of fifty books to villages and neighborhoods.

This system was copied in this country in the school district libraries which were started in the State of New York in 1835, and a few years afterward were in successful operation in several New England states, in Ohio, Michigan, and other states farther West.

Public libraries are seldom specialized, because they have to serve a mixed constituency. Local needs often determine, however, the choice of books to some extent. Owing to the rapid increase of these institutions a larger number of experts is needed for proper administration, and library schools have been established to supply trained men and women. Some of these schools, e. g., that of New York State, require since 1902 graduation from a registered college for admission. The Illinois State School since 1903 demands three years' college work for admission and grants a degree for two years additional and special library work.

Several organizations promote the special interests of librarians and their work, e. g., the American Library Association, with its organ *Public Libraries*. England has the Library Association of the United Kingdom; Australia a National Library Association; Germany a Verein Deutscher Bibliothekäre; France, Denmark, Italy, Switzerland, Japan, etc., have similar societies. The first international congress of librarians was held in London, 1877.

The support of the libraries is usually borne by the municipality or the State. New York State organized a library department in 1891, and grants towns and villages an amount equal to that raised in the commune up to \$200 per annum. Other states have committees.

The twelve largest libraries are: Bibliothèque Nationale, Paris, with 2,600,000 volumes, 250,000 maps, 102,000 manuscripts in 1894; British Museum, London, with 2,000,000 volumes, 200,000 maps, 100,000 pieces of musical compositions, 50,000 manuscripts in 1900; Imperial Public Library, St. Petersburg, 1,330,000 volumes in 1902; Königliche Bibliothek, Berlin, 1,200,000 volumes in 1902; Library of Congress, Washington, D. C., 1,000,000 volumes in 1900; Königliche Hof und Staatsbibliothek, Munich, 1,000,000 volumes in 1902; K. and K. Hofbibliothek, Vienna, 900,000 in 1901; Universitätsbibliothek, Strassburg, 814,000 in 1902; Public Library, Boston, 812,000 in 1902; Public Museum, Moscow, 800,000 in 1900; Public Library, New York, 787,775 in 1902; Bodleian Library, Oxford, 600,000 in 1900.

The Library of Congress has a floor space of nearly eight acres with 45 miles of shelving and room for 2,200,000 octavo volumes, and capable of being extended to a capacity of 4,000,000. The number of public libraries in the U. S. was 6,869 in 1903 with 54,419,000 volumes.

History

LIEBKNECHT, WILHELM: Editor, legislator; born 1826, at Leipsic; he studied at Giessen, Berlin, and Marburg. In the Revolution of 1848 took part at Baden, and was imprisoned from September to May; fled to Switzerland and then to England, where he remained till 1862; was much with Marx, and earnestly espoused his views. In 1862 returned to Germany, and edited the *North German Gazette* till it became a Bismarckian organ, when Liebknecht joined Lassalle's agitation. Became the leader of the International Party in Germany, won Bebel to socialism, and with him worked for the amalgamation of the movements started by Lassalle and Marx, thus forming the Social Democratic Party, of which he and Bebel are still the main leaders. In 1865 was ordered to quit Prussia; went to Leipsic and edited a democratic journal till it was suppressed in 1866. Returning to Berlin, was imprisoned three months. In 1867 he was returned to the North German Diet by a Saxon constituency and thereafter served regularly in the legislature until his death. Imprisoned in 1870, and again for two years beginning in 1872. In 1881 he was expelled from Leipsic under the Socialist law. Liebknecht was not an original thinker, but of high intellectual attainments, and a good writer. He died in 1900. Author of a work on the land question, "Zur Grund und Bodenfrage," etc.

LIFE-SAVING SERVICE, THE UNITED STATES: This service commenced in a small way in 1849 with an appropriation of \$20,000 by Congress. Previous to this the only organized attempts in this direction were of humane societies like that of Massachusetts, established in 1789. In 1871 the present U. S. service was established. To-day the ocean and lake coasts of the U. S. are picketed with the stations of the life-saving service attached to the U. S. Treasury Department.

At the close of the last fiscal year the life-saving establishment embraced 278 stations, 200 being on the Atlantic coast, 60 on the lakes, 17 on the Pacific coast, and 1 at the falls of the Ohio, Louisville, Ky.

There is also a U. S. Volunteer Life-saving Service Corps with 1,900 stations and 22,000 enrolled members. It has saved 6,557 lives in twelve years and has awarded 1,705 honor medals.

The following table gives the results:

| | Year ending June 30, 1906 | Since intro- duction of life-saving system in 1871, to June 30, 1906 |
|--|---------------------------------|---|
| Disasters..... | 357 | 16,479 |
| Value property involved..... | \$14,736,350 | \$242,683,699 |
| Value property saved..... | \$11,972,280 | \$192,024,612 |
| Value property lost..... | \$2,764,070 | \$50,659,087 |
| Persons involved..... | 4,699 | 116,442 |
| Persons lost..... | 19 | 1,127 |
| Shipwrecked persons succored at stations..... | 811 | 19,741 |
| Days' succor afforded..... | 1,727 | 47,555 |
| Vessels totally lost on U. S. coasts..... | 49 | |

In addition to the foregoing there were 491 casualties to smaller craft, such as sailboats, rowboats, etc., on which there were 1,221 persons, of whom 1,211 were saved and 10 lost. The cost of the maintenance of the service during the year was \$1,832,465.93.

In Great Britain the Royal National Lifeboat Institution was organized in 1824 and has now over 300 stations.

In France, a private society, the Société Centrale de Sauvetage des Naufragés, founded in 1865, is subsidized by the government.

Germany has a similar society, the German Society for the Rescue of the Shipwrecked, founded 1865.

Belgium had a small society as early as 1838, and Denmark in 1858. Most other civilized countries have followed suit. Japan in 1890. China is said to have had such a society for centuries.

LIGHTING, ELECTRIC AND GAS, PUBLIC OWNERSHIP OF (for a discussion of the general principles of, pro and con, see PUBLIC OWNERSHIP): In this article we present briefly the facts in the United States; as to Great Britain and Europe, see MUNICIPAL OWNERSHIP.

I. Electricity

According to the twelfth census (Bulletin 5) there were in the U. S. in 1902 3,620 central electric-lighting and power stations, of which the census gives the following table:

CENTRAL ELECTRIC STATIONS, 1902, AND WAGES OF EMPLOYEES

| ITEMS | Private stations | Municipal stations | No. em- ployees | Wages per day \$ |
|---|---------------------|-----------------------|--------------------|---------------------|
| Number of stations..... | 2,805 | 815 | 133 | Less than 0.75 |
| Cost of construction and equipment..... | \$482,710,879 | \$22,030,473 | 229 | .075 to 0.99 |
| Earnings from operation..... | \$77,349,749 | \$6,836,856 | 990 | 1.00 to 1.24 |
| Income from all other sources..... | \$1,385,751 | \$128,249 | 1,613 | 1.25 to 1.49 |
| Gross income..... | \$78,735,500 | \$6,965,105 | 3,380 | 1.50 to 1.74 |
| Total expenses..... | \$62,835,388 | \$5,245,987 | 2,314 | 1.75 to 1.99 |
| Salaried officials and clerks | | | 4,089 | 2.00 to 2.24 |
| Average number..... | 6,046 | 950 | 1,807 | 2.25 to 2.49 |
| Salaries..... | \$5,206,199 | \$457,381 | 1,899 | 2.50 to 2.74 |
| Wage-earners: | | | 823 | 2.75 to 2.99 |
| Average number..... | 20,863 | 2,467 | 832 | 3.00 to 3.24 |
| Wages..... | \$13,560,771 | \$1,422,341 | 309 | 3.25 to 3.49 |
| Output of stations: | | | 191 | 3.50 to 3.74 |
| Kilowatt hours—total for year..... | 2,257,598,213 | 195,904,439 | 43 | 3.75 to 3.99 |
| Total number of arc lamps..... | 334,903 | 50,795 | 123 | 4.00 to 4.24 |
| Total number of incandescent lamps..... | 16,616,593 | 1,577,451 | 24 | 4.25 to 4.49 |
| Total..... | | | 10 | 4.50 to 4.74 |
| | | | 8 | 4.75 to 4.99 |
| | | | 55 | 5.00 and over |
| | | | 18,878 | |

¹Includes estimated income from public service.

This table shows that of the total number of municipal plants, only 22 per cent were publicly owned and operated. It is also true that the kilowatt-hour output of these stations was only 7.8 per cent of the total energy and the capacity of all the dynamos in the municipal plants only 9.4 per cent of the total, which means that the municipal plants of the U. S. are yet but comparatively few, and in the smaller cities and towns.

They are nevertheless rapidly growing. Of the 574 municipal and private plants started prior to 1899 only 11.4 per cent were municipal, while of the 1,502 central lighting stations during the next seven years 21.2 per cent were municipal, and of the 1,544 stations started between 1896 and 1902, 27.8 per cent were municipal. It is probable that the reason for municipal ownership being more developed in smaller cities is because there is less profit for private companies in such cities and therefore less inducement to them to oppose municipal undertakings. What this means can be seen in the extent to which private companies are willing to spend money in large cities to mold opinion against public ownership. Professor Gray reports (Report of the Public Ownership Commission of the National Civic Federation, vol. ii., p. 135) that the New Haven Water Company, without apparently committing any illegal act, spent \$20,000 in molding public opinion and in lobbying through the city government and the state legislature a contract against public ownership.

Nevertheless, in spite of the opposition of private companies, municipal ownership is on the increase and wherever tried seems to have given satisfaction, as shown by the following quotations from the writer's report in the Public Ownership Report (see below).

There were investigated representative municipal and private plants, including the municipal plants of Chicago, Detroit, Allegheny, South Norwalk, and Jacksonville, Fla. The private plants which it was purposed to compare with these largely declined investigation. Nevertheless, what could be done was done (see Report) and some comparisons made.

Of South Norwalk, the expert, Professor Gray, reports: "The citizens seemed to take an enthusiastic and indeed admiring interest in the plant. In fact, the plant seems to be the one thing in South Norwalk in which the citizens take more pride and interest than in anything else in the city." The rates charged at South Norwalk of course cannot be as low as in a larger city or where fuel is cheaper; but in spite of these difficulties the rates are lower than are charged by many large private plants for a similar class of users.

Next to South Norwalk the most successful municipal electric-lighting plant is probably that of Detroit. If it were allowed to do a commercial business, its success would be undoubtedly greater than is possible with only the lighting of streets and public buildings. The city has, however, largely improved the service for the city over the former private system and has much reduced cost.

Of Chicago and Allegheny my report to the Civic Federation says:

The Chicago and Allegheny municipal lighting plants do not show as low operating expenses, the difference in the cost of coal being considered, as does Detroit, yet these plants are a remarkable confirmation of the wisdom of municipal ownership. They show that even in cities where political conditions are not of the best, and where good engineering is not fully observed in the construction of the plants, nevertheless municipal management may be justified. . . . Municipal ownership of electric light in Chicago started, as it did in the

case of water in that city and of many other municipal undertakings elsewhere, because of dissatisfaction with private ownership. The critics of municipal plants, when they detect faults in public management, must bear in mind that the private management which preceded it and led to public ownership was often worse than what has followed. . . . The spoils system has been singularly kept out of the Chicago plant, as is well brought out in Schedule L. With this condition, but with the serious handicaps already referred to, the question has been raised whether the municipal undertaking could stand comparison with the up-to-date and enormous private lighting company of Chicago in the cost of street lighting. Fortunately such a comparison is possible, because it has been made for our commission by Messrs. Marwick, Mitchell & Co. . . . In a study of the labor conditions of the public and private plants in Chicago in 1901, Prof. John R. Commons, our expert on labor in the present investigation, found that the wages of the city electric plants ranged from 8.1 per cent to 66.8 per cent higher per hour than those paid by the private company, while the average wages were probably 35 to 45 per cent higher, which meant that the total operating costs were 12 to 15 per cent more than they would have been had the wages been the same as in the private plants. ("Municipal Affairs," March, 1902, pp. 109-110.)

It is encouraging that the plant, however, in face of these high wages for an eight-hour day, has yet been able to make several hundred thousand dollars profit during the past twenty years above depreciation, taxes, and interest, in comparison with what private companies would have charged. This is, of course, on the assumption that the private companies, as above pointed out, had continued, as they doubtless would have done, to charge more for lights supplied from expensive underground conduits than from cheaper overhead construction.

The Edison and Commonwealth companies of Chicago, which are practically one, offered in 1906 to sell electricity to the city for \$75 per year for each arc lamp supplied from overhead construction, but this was on condition that the city should grant important concessions in other directions. When these concessions were vetoed by Mayor Dunne, the best the city could get for arc lights supplied from overhead construction was \$90 each per year.

In view of the above and other facts, the conclusion arrived at by the writer in reviewing the reports of the expert of the reports of the Federation, and which he has embodied in his portion of the report, is as follows:

It appears to the writer to be conclusively demonstrated from the above facts that in both water, gas, and electricity the municipal plants have done far better for the taxpayer and consumer than the private plants in anything like a similar situation. Prices have been lowered and the plants have been largely or wholly paid for out of earnings, where there were any, or may be considered to have been mostly or entirely paid for out of the difference between the prices charged by private companies in the neighborhood and the construction and operating costs of the municipal plants. In this method of computation all questions of depreciation are met. It is thus established that even where the management is no better than the freedom from political entanglements is no greater than in private plants, nevertheless the municipality has gained. This has been due to one of the great inherent advantages of municipal management, namely, the fact that all earnings above interest charges at 4 per cent or thereabouts on the original cost of construction, are available for reducing the capital charges and relieving the ultimate burden of such charges upon future consumers or patrons, or the earnings may be in part devoted to free public service, as in the case of many water departments. It has been established beyond question that there is less typhoid in cities having municipal water-works, which is good evidence of the purity of the public water-supply. The scope of this investigation has not led to a full development of the far larger public use of municipal than of private services, but such data as have been gathered indicate that there are more arc lights per 100,000 of population and far more use of incandescent lighting in public schools and other city buildings than where such services are furnished by a private company. In Detroit and Allegheny it has been easier to get appropriations for lighting the schools from the municipal plant than in securing appropriations to pay the prices charged for similar service by the private company.

Enough has been said about the political and labor conditions in the report of Professor Commons, and in the references in the above chapters. It is believed, however, that the largest benefit of municipal management has come in the case of the majority of the municipal undertakings investigated through the freeing of the department from political evils, and in freeing the city from the desire of investors in the plant to secure a weak or corrupt city government. Where such good results have not followed, but where instead the spoils system has prevailed, it has appeared that the monopolies in private hands were equally enmeshed in politics. The general conclusions of the study of American conditions show that in our better governed cities there is greater superiority of municipal management over private management in neighboring places than is the case in Great Britain.

II. Gas

Brown's Directory of the American Gas Companies for 1907 gives the following list of municipal gas-works in the U. S. and Canada with their output during 1906:

UNITED STATES

| CITIES | Feet output | CITIES | Feet output |
|-------------------------|-------------|------------------------------|---------------|
| Holyoke, Mass. | 136,970,000 | Gilroy, Cal. | 4,000,000 |
| Middleboro, Mass. | 1,874,600 | Alexandria, Va. | 44,000,000 |
| Wakfield, Mass. | 25,000,000 | Charlottesville, Va. | 19,000,000 |
| Westfield, Mass. | 18,150,500 | Danville, Va. | 42,000,000 |
| Norwich, Conn. | 40,000,000 | Fredericksburg, Va. | 8,834,000 |
| Bellefontaine, Ohio | 40,000,000 | Richmond, Va. | 410,000,000 |
| Hamilton, Ohio | 73,000,000 | Wheeling, W. Va. | 116,000,000 |
| Boscawen, Mich. | 1,200,000 | Cartersville, Ga. | 6,300,000 |
| Adams, Minn. | 151,000,000 | Dalton, Ga. | 9,000,000 |
| Duluth, Minn. | 151,000,000 | Talladega, Ala. | 5,000,000 |
| West Minneapolis, Minn. | 1,594,450 | Henderson, Ky. | 23,000,000 |
| Dell Rapids, S. Dak. | 1,838,000 | Total.... | 1,182,761,550 |
| De Smet, S. Dak. | 2,000,000 | Number of plants.... | 25 |
| Rich Hill, Mo. | 3,000,000 | Average size of 24 plants... | 49,281,731 |

CANADA

| CITIES | Feet output | CITIES | Feet output |
|------------------|-------------|--|---------------|
| Moncton, N. B. | 4,500,000 | Waterloo, Ont. | |
| Sorel, Que. | 4,000,000 | Total.... | 190,250,000 |
| Bellefleur, Ont. | 15,000,000 | Number of plants.... | 10 |
| Berlin, Ont. | 25,000,000 | Average size of 9 plants.... | 21,138,889 |
| Brackville, Ont. | 26,750,000 | Total sales of 33 plants in United States and Canada.. | 1,373,011,550 |
| Guelph, Ont. | 30,000,000 | | |
| Kingston, Ont. | 30,000,000 | | |
| Owen Sound, Ont. | 16,000,000 | | |
| St. Thomas, Ont. | 39,000,000 | | |

The largest and oldest municipal gas-works in the U. S., or indeed in all North America, is that of Richmond, Va., with a population in 1906, as estimated by the U. S. Government, of 87,246. The city constructed the plant, in 1852. At the close of the war the plant, like all business in Richmond, was dilapidated and the records are not at hand for the earlier years. A report was made by an expert accountant, Mr. H. D. Boudar, April 15, 1897, and reprinted in subsequent annual reports. This shows that during the thirty years ending with 1896 the earnings of the plant had not only taken care of all the reconstruction since the war, but had paid back to the city its previous outlays, and had turned over in cash \$135,906.31. Since the plant had been paid for out of earnings it was not necessary to allow the city interest on the plant as had been done in the above computations. Taking this latter fact into consideration, the accountant reported: "This surplus (\$135,906.31) must be still further increased by the difference between the value of gas furnished the city for public consumption and the interest allowed the city on the cost of the works, etc., say \$358,074.23, making a total surplus of \$493,980.54 after repaying the city for its investment."

The accountant further asserted that the net revenue up to 1886 more than reimbursed the city for its outlay.

Since 1896 the gas-works, as appears from its

last annual report, has turned into the city treasury \$622,208.55 in cash, and \$40,000 a year, or \$400,000 in all, as a nominal interest charge on the assumed value of the plant. Since the plant, however, had been paid for out of earnings and there is no bonded debt, this \$400,000 is to be considered as part of the profits, making a total profit of \$1,022,208.55 less expenditures, amounting to less than half of this amount which has been put into extensions during this same ten-year period.

The city must also be credited with the value of the gas used in the streets and public buildings, and worth at \$1 a thousand feet over \$25,000 in 1906, and from \$20,000 to \$30,000 every year during the last ten years. The plant therefore has netted the city over and above the plant itself and its extensions about \$500,000 in cash and \$250,000 from the gas during the last ten years, and \$500,000 during the previous thirty years.

Richmond, also, was one of the first cities in the South to reduce the price of gas to \$1, which it did in 1893.

A committee of the city council was authorized in 1905 to hire a gas expert to suggest plans for enlargement and improvement of the works. To the surprise of most of the people of Richmond he recommended the lease or sale of the works, and indulged in many criticisms of the management.

The controversy that arose thereafter showed that many of his criticisms were mistaken and that the failure to make needed improvements in the works and distributing system previously had been due to the great need of the city for funds in other directions. It would have been, however, more profitable in the long run for the city to have been more liberal in its improvement of the gas-works, for operating expenses would thus have been reduced. This is one of the weaknesses of many municipal plants. The earnings go into the city treasury instead of being used for the improvement of the plant and the reduction in price. Richmond, however, is now seriously at work increasing the capacity of the plant and rendering it possible to have greater economies in the production of gas. Fortunately, there is every evidence of honest management. The labor force is well paid, contented, and efficient. Politics does not seem to have any place, and the council with only one dissenting vote decided to reject all propositions for either lease or sale.

The sale of gas to private consumers in 1906 was 318,661,000 feet, and for the street lamps 25,200,000 feet.

Another municipal plant of much age and reputation is that of Bellefontaine, Ohio, population 6,649 in 1900, which was built in 1873. Its last annual report for the year 1906 shows a profit for the year of \$2,724.70 after paying out \$11,096.16 for extensions and for the reduction of bonds issued for some recent extensions. Since the plant has been almost entirely paid for out of earnings, there is no interest charge of any importance. It may be remarked that neither in Bellefontaine nor Richmond is any allowance made for taxes that a private plant would pay, but these taxes are not large. At five cents per 1,000 feet, which is a common figure in private gas companies, they would amount to only about \$1,600 in Bellefontaine, and about \$16,000 in Richmond.

The city for some time has charged \$1.25 for gas for illuminating purposes, and seventy-five cents for fuel purposes, and sold in 1906 11,411,400 feet for lighting, and 22,636,200 feet for fuel

purposes, and also 1,674,320 feet for public uses. The leakage and condensation was 8 per cent. This was normal for such a plant. The leakage at Richmond, 15.2 per cent, was high, tho often found in private works. Bellefontaine on Jan 1, 1907, reduced the price of gas for fuel purposes to fifty cents per 1,000 feet.

While the oldest municipal gas-works is Richmond, yet Alexandria, Va., was started only one year later, namely, in 1853. In its report for the year ending May 31, 1907, it states that out of the profits there was transferred to the city for that year \$15,500, making a total amount transferred up to date \$235,590.75 in cash, while \$193,206.63 has been put into the plant out of earnings. All the plant had thus been paid for. The sales of 34,474,500 feet to private consumers in 1905-6 yielded \$39,964.65, or \$1.16 per 1,000 feet. In addition to this and to the cash already referred to as delivered to the city treasury, there was used by the city without charge 4,849,000 feet of gas, which at the prevailing rate would have been worth \$5,334, or over twice what the taxes would have been if the works had been in the hands of a private company. This publicly used gas was equal to over thirteen cents per 1,000 feet of all the gas sold to private consumers or used by the city.

Two municipal plants are generally recognized as failures: Philadelphia, Pa., and Hamilton, Ohio, but even they have justified their existence as municipal plants. Philadelphia was badly managed, the spoils system prevailed, strong engineers were not put in charge, and there was not sufficient money appropriated by the city councils for improvements. Nevertheless, the plant during the approximately fifty-six years of its existence prior to its lease in 1897 to the United Gas Improvement Company had paid for itself out of earnings, and during four fifths of the time had furnished gas at a lower price than the private companies in New York City. When the property was leased ten years ago, Philadelphia by virtue of its ownership was able to secure much better terms than New York

Philadelphia City was then enjoying, or is now enjoying, and in twenty more years the plant comes back to the city with large improvements. The lease seems to have been secured by bringing much pressure to bear on the city government in 1897. Even prior thereto the refusal of the city councils to make improvements in the management and character of the plant seems to have been partly due to outside influence. The city government at the time of the city lease voted down a proposition for a referendum vote, and the people only a week previous had approved the appropriation of \$1,000,000 for the improvement of the works. The private company has undoubtedly given excellent service, but showed the dangers of the situation when it participated in a movement for lengthening the lease from thirty years to seventy-five years in 1905, altho the city government had not been elected on that issue or with any public discussion of that question.

The city of Hamilton through its municipal plant secured a reduction in the price of gas from \$2 per 1,000 feet to 80 cents, but failed to take advantage of the opportunity it had to buy out the existing private company at a reasonable price. A fierce competition ensued. The city plant appears to have had neither non-partizan nor efficient management, and finally was sold in 1907 to a natural-gas company.

The lessons of these two plants point to the fact that any large and permanent success in municipal ownership can only be expected where a community has reached such a stage of political development as to have reasonable promise of responding to the stimulus which municipal ownership usually creates in the better developed of our cities. The great growth of municipal ownership, however, as shown by the table, indicates that the movement toward public management, which has been so very promising in water and in the smaller electric-light plants, is now beginning to affect the gas industry.

Wheeling, W. Va., whose population is estimated by the U. S. Government as 41,494 in 1906, has suffered seriously from the spoils system, and from the fact that the town became discouraged over the consequences of a very un-

wise contract with a natural-gas company. The city should have bought the gas at wholesale at the city limits and supplied it to all desiring the same. Instead of that, the

city gave a contract to this company to pipe its streets, but to sell only for fuel uses except in streets where the city had no mains. Inasmuch, however, as this gas is sold for eighteen cents and can be used with Welsbach mantles for lighting, the city has had difficulty in preventing its use for that purpose, and has been discouraged in the improvement of its artificial-gas works. Had the proper policy been followed the city would have ceased to make artificial gas as long as natural gas lasts and have supplied the cheaper gas. Fortunately the city, despite all these handicaps, has had a brilliant success financially. It has supplied gas for seventy-five cents since 1887, and to-day has only three rivals for as low a price as seventy-five cents for general lighting purposes, one of these being the municipal plant of Duluth, Minn., and the other two being the large private plants of Cleveland and Cincinnati, but Wheeling started the seventy-five-cent rate long before any of the others.

The city, however, in spite of this low charge and of the fact that even prior to 1888 it took the lead in reduction of price, has paid for its entire plant out of earnings and turned into the city treasury for the construction of an electric-light plant and other purposes about \$400,000.

Although politics has greatly hampered the success of the plant, it is interesting to note that it has likewise largely entered into the relations of the street-railways and private electric-light and natural-gas companies to the city government.

Great efforts were made, 1897-1902, at Holyoke, Mass. (estimated population in 1906, 50,778), to secure an electric-light and gas plant for commercial and public uses. Under the Massachusetts law a city cannot construct and operate a lighting plant if there is a private enterprise already in the field unless the city

Holyoke, Mass. first buys out the latter provided it desires to sell. In all cases the companies have decided to sell. The

supreme court of the state has appointed a commission in each instance. These commissions have usually forced cities to pay not merely the structural value of the plant including a liberal allowance for property which had to be scrapped immediately after city purchase, but have also forced the cities to pay for the capitalization of the earnings at the time of purchase.

After a tedious litigation which cost the city

and private company about \$300,000, Holyoke began to operate both the gas and electric-light plants in Dec., 1902. Altho handicapped by a large purchase price and the costs of litigation, the city has reduced the price from \$1.34 to \$1.21, while during the previous seven years of private ownership there had been no decrease in price. The consumption has increased from 83,592,000 feet in 1901-2 to 121,570,000 feet in 1905-6. The cost of gas after paying interest and a very large depreciation and sinking-fund charge of five per cent on the cost of the plant was only \$1.10. On account of the price of coal and oil, all gas companies of Massachusetts have larger costs than in most other sections of the country east of the Missouri River.

Duluth has made the most striking success of any city with its municipal gas-works. When the city bought the gas-works in 1898 the price was \$1.90 for light and \$1 for fuel, but the city rapidly reduced the price (Oct. 1, 1905) to seventy-five cents for both light and fuel uses and

Duluth,
Minn.

fifty cents when the gas is used in gas-engines and furnaces. The consumption has increased from 25,309,363 feet in 1899 to 151,004,300 feet in 1906. In spite of these low

charges the earnings of the department are ample to pay the interest and keep up the repairs. It is somewhat doubtful whether a sufficient amount is being laid aside for depreciation, but with the rapid increase of business it is probable that henceforth depreciation charges will be covered by the earnings unless the price is still further reduced.

The city for a time after the purchase of the plant manufactured its gas, but in 1904 was able to make so good a contract for the purchase of its gas from a coke-oven plant, as do private companies in Boston, Detroit, Chicago, Milwaukee, and elsewhere, that it has been no longer necessary for the city to run its own plant. It is kept in condition to operate whenever the necessity may arise.

It is remarkable that, following the lead of Alexandria and Richmond, two other Virginia cities, Danville and Charlottesville, began municipal gas-works in 1876, and Fredericksburg in 1893; Henderson, Ky., dates from 1866, but today the developments are mostly in the North and in Canada, where the higher standards of municipal government render a large measure of success more likely. EDWARD W. BEMIS.

REFERENCES: See PUBLIC OWNERSHIP.

LINCOLN LEGION, THE: A temperance organization standing for Gospel temperance and pledge signing, organized at Oberlin, Ohio, in 1903, under the auspices of the Anti-Saloon League (q. v.). The name is derived from a pledge taken in his early days, worked for, and administered by Abraham Lincoln. The Lincoln pledge, which is made the pledge of the order, is as follows: "Whereas, the use of alcoholic liquors as a beverage is productive of pauperism, degradation, and crime, and believing it our duty to discourage that which produces more evil than good, we therefore pledge ourselves to abstain from the use of intoxicating liquors as a beverage."

Enrolled signers are formed into a very simple order by hundreds, thousands, county divisions, and state divisions. It is expected that in each locality at least one annual reunion shall be held, preferably upon Lincoln's birthday. Several

hundred thousand persons are now enrolled. Superintendent, Howard H. Russell, D.D., 103 East 125th Street, New York City.

LINDERBERG, FERNANDO: Director Sociale Secretariate and Bibliotek; writer; Socialist; born 1854, Copenhagen, Denmark; educated in the country until sixteen years of age; learned gardening and lived as a gardener until his twenty-fifth year. In 1880 began the publication of *Folkebladet*, a weekly paper for the working people; later published various historical writings for the people; in 1895 wrote a larger work on socialism and competition, and other writings on social questions and the labor movement. His latest and most important work treats of the relation of Christianity to social evolution. Mr. Linderberg had a *privat stipendium* from 1896-98 to enable him to study the social questions and movements in Germany, Switzerland, and England. On his return to Copenhagen he organized in 1898 a committee for promoting the knowledge of social conditions and problems; in 1900 the Social Secretariate and Library whose aim is to follow and further the enlightenment of social conditions and movements abroad and at home partly as the Fabian Society and partly as the Christian Social Union in England and the American Institute of Social Service.¹ He is the author of "Frikonkurrenzen og Socialismen"; "Werner Sombart and the Socialistic Working Movement"; "Henry George"; "Karl Marx"; "Kristendommen og den sociale Udvikling." Address: Sagasvej 14, Copenhagen, Denmark.

LINDSAY, SAMUEL McCUNE: Professor of social legislation in Columbia University, and director of the New York School of Philanthropy; born in Pittsburg, Pa., 1869; educated in public and private schools in Philadelphia; graduated from the University of Pennsylvania (1889). In 1894 he was appointed instructor in sociology in the University of Pennsylvania, and later professor. Expert for the Senate Finance Committee at the time of the Brussels Monetary Conference, 1892; special agent for the United States Industrial Commission, 1900 to 1902; 1902 to 1904 Commissioner of Education for Porto Rico; secretary of the National Child Labor Committee; 1904 a member of the Board of Public Education of the city of Philadelphia, 1906-7; is first vice-president and for several years was president of the American Academy of Political and Social Science. His chief interest is in the problems of public education and child labor, upon which he has written extensively. Among the more important contributions are: "Die Preisbewegung der Edelmetalle (Jena, 1893); "Social Aspects of Philadelphia Relief Work" (Philadelphia, 1895); "Railway Labor in the U. S." (Washington, 1902); "History of the Establishment of the Public School System in Porto Rico" (Washington, 1905); "Child Labor." Edited three Annual Reports of the National Child Labor Committee (New York, 1905-7).

LINDSEY, BEN. B.: Judge of the Juvenile Court; born in Jackson, Tenn., 1869; educated in public schools. On Jan. 8, 1901, he was appointed judge in the Denver County Court, where he sat over a number of children's cases. He soon found that sending minors to jail served mainly to get boys into contact with hardened criminals.

¹ Mr. Linderberg is a Fabian Socialist.

His principle was that institutions should serve man, and not man become a slave to institutions. So he had a law passed authorizing a Juvenile Court with large discretionary powers. In order to attack juvenile crime as a whole he formed the "Kids' Citizens League," which put boys on their honor. He interested adults in the children through his "Juvenile Association for the Betterment and Protection of Children," and had sand piles, playgrounds, swimming-pools, etc., provided for them. To prevent temptation of young girls he succeeded in getting the wineroms closed, and had the law concerning child labor made stricter and properly enforced. He found that adults were often partly responsible for juvenile crimes, and so he had the "Contributory

Delinquency Law Against Adults" passed, which held negligent parents, employers, etc., accountable. He freed Denver from the tyranny of the corporations by having the election law revised. The boys sentenced to the industrial school at Golden are put on their honor, and go unattended; only three out of several hundred have betrayed his trust. He travels and lectures on children's problems during vacation. Author: "Problems of the Children." Address: Denver, Col.

LIQUOR CONSUMPTION (see also LIQUOR TRAFFIC; INTemperance, for the evils of drinking; and TEMPERANCE, for what is done for their reform): In this article simple facts and statistics of liquor consumption are given.

THE UNITED STATES

Compiled from the Statistical Abstract of the U. S., 1906

¹ Since 1885 includes domestic spirits exported and returned.
² Does not include data with respect to commerce between the U. S. and insular possessions from 1901 to date.
³ Product less domestic exports.

NOTES.—(1) The production of domestic wines was estimated by the Department of Agriculture, by Mr. Charles McK. Looser, president of the Wine and Spirit Traders' Society of New York, and other well-informed persons, except that the production for 1889 is that officially reported by the Bureau of the Census Department of Commerce and Labor. (2) The consumption of domestic spirituous and malt liquors is derived from reports of the Commissioner of Internal Revenue.

GREAT BRITAIN

From statistics published annually in *The Times*, by Dr. Dawson Burns

| LIQUORS CONSUMED IN 1905 | | Quantities | Cost, 1905 | Total annual cost |
|--|--|------------|--------------|----------------------|
| British spirits, 56s. 6d. per gallon | | 32,598,932 | £43,193,585 | 1905... £164,167,941 |
| Other spirits, 56s. 6d. per gallon | | 6,770,334 | 8,971,355 | 1904... 168,987,105 |
| Total spirits (gallons) | | 39,369,766 | 52,164,940 | 1903... 174,445,272 |
| Beer, 60s. per barrel (barrels) | | 33,250,654 | 99,751,962 | 1902... 179,499,817 |
| Wine, 18s. per gallon (gallons) | | 11,945,599 | 10,751,039 | 1901... 181,738,243 |
| British wines, cider, etc., estimated 2s. per gallon (gallons) | | 15,000,000 | 1,500,000 | 1900... 184,881,190 |
| | | | | 1899... 185,927,227 |
| | | | £164,167,941 | |

This decreased annual expenditure on drink is notwithstanding an increasing population.

Dr. Burns figures the consumption per head as follows:

| ENGLAND | | | | |
|-----------------------|---------------------|----------|-------------|----------|
| LIQUORS | Quantities consumed | Per head | Expenditure | Per head |
| | | Gals. | £ | £ s. d. |
| British spirits | 22,305,046 | | 29,554,186 | |
| Other spirits | 5,496,567 | | 7,282,951 | |
| Total spirits (gals.) | 27,801,613 | .8 | 36,837,137 | 1 1 6 |
| Beer (barrels) | 29,670,987 | 31.3 | 89,012,961 | 2 12 2 |
| Wine (gals.) | 10,153,759 | .3 | 9,138,383 | 0 5 4 |
| Other liquors (gals.) | 14,000,000 | .4 | 1,400,000 | 0 0 10 |
| | | | 136,388,481 | 3 19 10 |

| SCOTLAND | | | | |
|-----------------------|-----------|-----|------------|--------|
| British spirits | 6,667,156 | | 8,833,982 | |
| Other spirits | 689,143 | | 913,115 | |
| Total spirits (gals.) | 7,356,299 | 1.6 | 9,747,097 | 2 1 8 |
| Beer (barrels) | 1,188,929 | 9.0 | 3,566,787 | 0 15 3 |
| Wine (gals.) | 1,194,560 | .3 | 1,075,104 | 0 4 7 |
| Other liquors (gals.) | 500,000 | .01 | 50,000 | 0 0 3 |
| | | | 14,438,988 | 3 1 9 |

IRELAND

| LIQUORS | Quantities consumed | Per head | Expenditure | Per head |
|-----------------------|---------------------|----------|-------------|----------|
| | | Gals. | £ | £ s. d. |
| British spirits | 3,626,730 | | 4,805,417 | |
| Other spirits | 585,124 | | 775,289 | |
| Total spirits (gals.) | 4,211,854 | 1.0 | 5,580,706 | 1 5 5 |
| Beer (barrels) | 2,390,738 | 2.0 | 7,172,214 | 1 12 8 |
| Wine (gals.) | 597,280 | .1 | 537,552 | 0 2 6 |
| Other liquors (gals.) | 500,000 | .1 | 50,000 | 0 0 3 |
| | | | 13,340,472 | 3 0 10 |

It should be noted that the official returns do not specify the quantities of beer and wine consumed in each kingdom. It is estimated, however, that 25 per cent of the beer paying duty in Scotland and Ireland is consumed in England; and that of the wine consumed 85 per cent is used in England, 10 per cent in Scotland, and 5 per cent in Ireland.

It would thus seem that of the United Kingdom England is consuming by far the largest amount of wine.

¹ The figures for 1899-1900 are from statistics published by the Board of Trade of Great Britain and Ireland. All others from Rowntree and Sherwell's "The Temperance Problem and Social Reform." ² 1889. ³ 1886-90. ⁴ 1887-89. ⁵ 1891-94. ⁶ 1893-94. ⁷ 1888-92. ⁸ 1894. ⁹ 1892-94. ¹⁰ 1893. ¹¹ 1892. ¹² 1888-92. ¹³ 1888-89. Alcohol strength of beer taken at 5 per cent for the United Kingdom and 4 per cent elsewhere. Wine taken at 15 per cent in the United Kingdom and United States, 12 per cent in Italy, 10 per cent elsewhere, except that in Norway it has been taken at 15 per cent since 1896. For the English colonies beer has been taken at 5 per cent and wine at 12 per cent.

CONSUMPTION OF ALCOHOLIC BEVERAGES (1902)

THE DRINK EXPENDITURE IN TWELVE PRINCIPAL TOWNS
IN 1905

| | | | |
|------------|-------------|-----------|------------|
| London | £18,779,996 | Sheffield | £1,748,828 |
| Liverpool | 2,994,144 | Bristol | 1,386,356 |
| Glasgow | 2,469,062 | Bradford | 1,151,612 |
| Manchester | 2,253,520 | Dublin | 1,148,379 |
| Birmingham | 2,173,100 | Belfast | 1,086,837 |
| Leeds | 1,818,344 | Edinburgh | 1,035,038 |

Of the progress since 1881, Messrs. Rowntree and Sherwell say ("The Taxation of the Liquor Trade"): Taking the whole of the United Kingdom, they point out that "the number of public-houses has fallen from 96,727 in 1881 to 91,502 in 1904, a decrease of 5,225, or 5.4 per cent. Meantime the population has increased from less than 35,000,000 to nearly 43,000,000, an increase of 23 per cent. The estimated national expenditure upon alcoholic beverages has also increased during the same period by at least £23,000,000, or 16 per cent."

LIQUOR TRAFFIC, THE: The total cost, direct and indirect, of the liquor traffic of any country, no man knows or can know. Various estimates have been made at different times of

the "drink bill" of various nations, but the amount of these depends very largely on the extent to which the costs of the administration of justice, crime, and pauperism are attributed to drink. On this point authorities differ. (See **POVERTY, CAUSES OF**.) All are agreed only that the contribution of drink to such cost is enormous and that the annual drink bill of each principal nation runs into hundreds of millions of dollars. Only actual figures can be given as to portions of the cost of the liquor traffic. The problems of drink, poverty, and unemployment are, moreover, so interwoven that it is practically impossible to separate them. They should always be treated as a whole, if one would like to get a picture of their dire influence. They must, nevertheless, be treated separately, in order to become intelligible.

I. The United States

(For the consumption of liquor in the United States, see **LIQUOR, CONSUMPTION OF**.) The following are the statistics of production:

FERMENTED LIQUORS AND DISTILLED SPIRITS PRODUCED, AND DISTILLED SPIRITS TAX PAID FOR CONSUMPTION
(From reports of the Commissioner of Internal Revenue)

| YEAR (ended June 30) | Production of fermented liquors | PRODUCTION OF DISTILLED SPIRITS, EXCLUSIVE OF BRANDY DISTILLED FROM FRUIT | | | | | | | | |
|----------------------------|--|---|---------------|------------|------------|------------|---------------|--|--------------------|-------------|

The census of 1900 gives the following statistics of persons engaged in the U. S. in the liquor traffic:

| OCCUPATION | Male | Female | Total |
|---|---------|--------|---------|
| Saloon-keepers..... | 81,789 | 2,086 | 83,875 |
| Bartenders..... | 88,497 | 440 | 88,937 |
| Retail dealers in liquors and wines..... | 12,928 | 191 | 13,119 |
| Bottlers (not soda- and mineral-water)..... | 8,942 | 776 | 9,718 |
| Brewers and maltsters..... | 20,709 | 275 | 20,984 |
| Distillers and rectifiers..... | 3,115 | 30 | 3,145 |
| Hotel-keepers..... | 46,386 | 8,545 | 54,931 |
| | 262,366 | 12,343 | 274,709 |

Besides these must be included a large number of druggists, grocers, restaurant- and café-keepers, waiters, and employees in transportation, etc.

The *National Temperance Almanac* for 1907 gives the statistics, taken from government sources, presented in tabular form on p. 720.

As to the total amount of money invested in the liquor traffic, we have only estimates. The *National Temperance Almanac* (1907) estimates the direct cost at \$1,500,000,000, and compares this with \$273,000,000 spent for public schools, \$25,000,000 for clergymen's salaries, and \$689,592,000, the net earnings of railroads. An estimate was made by an American delegate to the International Congress against Alcoholism at Stockholm (Aug., 1907), putting the total capital in the U. S. invested in the liquor traffic, in 1907, at \$415,000,000. One should remember, tho, that figures vary, and that even under the most favorable circumstances they do not give a true idea of the actual state of affairs. For instance, one can never state exactly what percentage is used in the trades; 20, 25, or 30.

Fermented and Malt Liquors

| | |
|---|------------------------|
| Ale, beer, lager-beer, porter, and other similar fermented liquors..... | \$54,651,636.63 |
| Brewers (special tax)..... | 162,637.57 |
| Retail dealers in malt liquors (special tax)..... | 311,698.04 |
| Wholesale dealers in malt liquors (special tax)..... | 515,886.32 |
| Total..... | \$55,641,858.56 |

CITIES

In New York City the number of liquor-tax certificates in force (1906) were, for hotels, 2,459, and saloons, clubs, etc., 8,317. The net revenue from licenses was \$11,470,142 (of which \$7,735,223 went to the state).

For Chicago, Mr. G. K. Turner (in *McClure's Magazine*, April, 1907) gives the following suggestive figures which may serve to show the extent and methods of the liquor trade in other cities. He says (in brief):

In 1906 the receipts in the retail liquor trade in Chicago were over \$100,000,000; they were probably about \$115,000,000. There are 7,300 licensed liquor sellers in Chicago, and in addition about a thousand places where liquor is sold illegally. The only business which approaches this in number of establishments, according to the Chicago directory, is the grocery trade, which has about 5,200. The city spends at least half as much for what it drinks as for what it eats—not counting the cost of the cooking and serving of food.

The great central power in the liquor business in America is the brewery. In the past thirty-five years the per-capita consumption of spirituous liquor in the U. S.

**Liquor
Traffic
Methods**

has increased not at all. The per-capita consumption of malt liquor has trebled. This increase has come, partly because of the demand for a milder drink, but largely also because of another fact: because the breweries own or control the great majority of the saloons of American cities. They have a distinct policy:

If there are not as many saloons as there can be, supply them. This is what has been done in Chicago. Fully 90 per cent of the Chicago saloons are under some obligation to the brewery; with at least 80 per cent this obligation is a serious one.

Almost every saloon-keeper sells the beer of one brewer only. There is now one retail liquor dealer to every 285 people,

| Total for year ended June 30, 1906.. | 2,405 | 243,400 | 6,311 | 41 | 1,747 | 17,094 | 10,871 |

disregarding, of course, the 1,000 unlicensed dealers. In the laboring wards the licensed saloons run as many as one to every 150.

Chicago expended not less than \$55,000,000 for beer in 1906.

II. Other Countries

Dr. Dawson Burns, who is considered the best authority on the subject in the United Kingdom, says (*Daily Mail Year Book*, 1907):

The total expenditure in the United Kingdom on distilled and fermented liquors in 1905 may be taken at £164,167,941, which amount, compared with the expenditure in 1904, shows a decrease of £4,819,224. On spirits there was a decrease of £1,857,169; on beer, of £2,222,093; on wine, of £39,962.

As this is the sixth year showing a consecutive annual decreased expenditure on alcoholic liquors, it will be interesting to enumerate each annual decrease since 1899, when the estimated expenditure was £185,927,227—1900 showed a decrease of £7,046,031; 1901, £3,142,953; 1902, £2,238,426; 1903, £5,054,546; 1904, £5,458,106; 1905, £4,819,224; decrease in six years, £21,759,286.

But it should be further observed that the population of the United Kingdom has increased since 1899 to the extent of 2,659,824, or about 6½ per cent; and, if the expenditure had proportionately increased, it would have amounted in 1905 to £198,012,495. But it not only failed to rise to that amount,

but fell to £164,167,941, thus giving an actual and proportional decrease of £33,844,554.

Dr. Burns estimates the drink expenditure for 1905 of London at £18,779,906; Liverpool, £2,799,144; Glasgow, £2,449,062; Manchester, £2,253,520; Birmingham, £2,173,100. The capital value of breweries, distilleries, and their licensed property, and of all licensed houses and the trade in all forms in the United Kingdom, was estimated in 1898 to be £230,000,000. The number of breweries licensed 1905-6 was 5,142, compared with 9,050 in 1894-95, there being a strong tendency to combination of the trade in a few large firms.

The German Empire spent (1905-6) 2,826,000,000 marks for alcoholic drinks, compared with 410,000,000 mk. for public schools, according to Dr. Waldschmidt. (*Der Alkoholisismus*, March, 1906.) For other countries the extent of the traffic can only be estimated from the amount of their liquor consumption. (See LIQUOR, CONSUMPTION OF.)

LIST, FRIEDRICH: German Nationalist; born at Reutlingen, Württemberg, in 1789. Professor of political economy at Tübingen in 1817, he resigned in 1819 to devote himself to the development of German industry. Elected to the Diet of Württemberg, he exposed the vices of the administration, and was condemned in 1822 to ten months' imprisonment. Fled to Switzerland, but returning in 1824, was imprisoned at Asperg, later was pardoned and allowed to emigrate to the United States. He settled in Pennsylvania, published here his "Outlines of a New System of Political Economy" (1827), in which he attacked the ideas of Adam Smith, and outlined an economy on a national basis. Having discovered a deposit of anthracite on his grounds, he was able to return to Europe in 1833 with an independent fortune. Settled at Augsburg and devoted himself to an agitation for a suitable system of railway lines and to economic writing. In a fit of despondency he shot himself, Nov. 30, 1846.

Ingram says of him:

Another element of opposition [to the *laissez-faire* school in Germany] was represented by Friedrich List (1798-1846), a man of great intellectual vigor as well as practical energy, and notable as having powerfully contributed by his writings to the formation of the German Zollverein. His principal work is entitled "Das Nationale System der Politischen Oekonomie" (1841; 6th ed., 1877; Eng. trans., 1885). . . . He was particularly against the cosmopolitan principle in the modern economical system that he protested, and against the absolute doctrine of free trade, which was in harmony with that principle. He gave prominence to the national idea, and insisted on the special requirements of each nation according to its circumstances and especially to the degree of its development. . . . The nation having a continuous life, its true wealth consists—and this is List's fundamental doctrine—not in the quantity of exchange-values which it possesses, but in the full and many-sided development of its productive powers.

LIVERMORE, MARY ASHTON (née RICE): Temperance advocate, woman suffragist, lecturer; born in Boston, 1821. Was a pupil and for some time a teacher in the female seminary in Charlestown, Mass. Left this to teach a family school in Virginia, and remained there three years, to return North a radical abolitionist. While teaching at Duxbury, Mass., she met Daniel P. Livermore, a Universalist clergyman, whom she married, devoting herself to aiding his temperance labors. In 1862 she became one of the agents of the northwestern branch of the United States Sanitary Commission, and during that year traveled throughout the Northwest, everywhere organizing sanitary aid societies. In the spring of 1863 she made a tour of the hospitals and military posts on the Mississippi.

After the war she labored in the woman's suffrage and temperance movements. In 1869 she established the *Agitator*, a woman's suffrage paper, but in 1870 became editor of the *Woman's Journal* of Boston. In 1872 she resigned to devote herself to the platform, and for years spoke five nights in the week for five months in the year.

Mrs. Livermore was much interested in politics; was twice sent by the Republicans of her town as delegate to the Massachusetts State Republican Convention, charged with the presentation of woman suffrage resolutions, which were accepted and incorporated into the party platform. She was for ten years president of the Massachusetts Woman's Christian Temperance Union. President of the Woman's Congress during the first two years of its organization, she also served as president of the American Woman Suffrage Association. She died in 1905.

LIVERPOOL: An English city of considerable antiquity. It has been identified as the British port called *Portus Segantiurum* by Ptolemy, the geographer of Alexandria, and dates therefore from the Roman occupation of Britain. The origin of the modern name is doubtful, but the most probable derivation is from the Teutonic *hlith* = a slope; thus Liverpool or Litherpool, as it was sometimes written, may mean the "pool on the slope." The topography of the city gives some support to this theory. The earliest charter of Liverpool was granted by Henry II. in 1173. King John granted a charter in 1207, and the history of Liverpool as a borough may be said to date from the latter year. The growth of the population was slow until the end of the eighteenth century. In 1700 the population was but 5,700 persons. Gradually the maritime and commercial business of the port assumed important dimensions. Beginning with Ireland and the coastwise trade, the merchants rapidly extended their operations to the Virginian tobacco trade, the West Indies, North America, and the west coast of Africa, the latter eventually becoming the most important market. Many of the ships were "privateers," adding the spoils of warfare to the profits of commerce, and quite a large number were engaged in the slave trade between the Guinea coast and the West Indies.

History

From a return made in the year 1771 it appears that 105 ships sailed from Liverpool to Africa, and carried to the West Indies 28,200 negroes. In 1788, when suppression of slavery was agitated, it was stated that the profit to Liverpool from the slave trade amounted to £300,000 per annum. In 1801 the population of the city had risen to 77,000; by 1851 it rose to 375,955; by 1901, to 686,332; and by 1904 to 723,430.

The system of docks for which Liverpool is world-famous originated in 1708, when Thomas

Docks

Steers recommended and carried out the conversion of the "Pool" into a wet dock by impounding the water with flood-gates, so as to keep vessels afloat regardless of tide. The flood-gate had been employed in ancient times, and by the Dutch and Italians at a more modern period, in connection with canals and irrigation, but Liverpool was the first to utilize it in a tidal estuary for the purpose of neutralizing its ebbs and flows. The first dock was opened in 1715. There are now in existence 63 wet docks, the largest of them being capable of accommodating the largest of steamships. The total water area of the docks is about 700 acres with a lineal quayside of about 50 miles. There are also numerous graving docks for repair work. Many of the docks are surrounded by warehouses for the storing of cargo. The Tobacco Warehouse at Stanley Dock, 125 feet high, with a floor area of 36 acres, is probably the largest warehouse in the world, and is capable of storing 60,000 hogsheads of tobacco. Special warehouses have been provided for grain, wool, and general produce. A landing stage for enabling passengers to land and embark at any state of the tide, extends for 2,478 feet along the river-front. The entire Dock Estate, a property of enormous value, is controlled and managed by a body of twenty-eight gentlemen known as the Mersey Docks and Harbor Board, constituted by act

The Dock Estate

of Parliament. Twenty-four of these are elected by the dock ratepayers, i. e., persons paying rates and dues on ships and goods, and the remaining four are appointed by a commission consisting of three members of the British Government. The aggregate tonnage entering and clearing at Liverpool during the year ending June 30, 1906, was 32,295,712 tons. There is perhaps no greater monument to the wisdom and efficiency of public management than the Liverpool Dock Estate. Without the incentive of individual gain, the representatives of the commercial community devote their best energies to the consolidation and enlargement of the public estate; they receive no remuneration whatever for their services—the position being regarded as an honor to be attained only by the best men in the various branches of trade. No interest, political or otherwise, is allowed the slightest footing in the councils of the board, and it would be difficult to find another instance of services so impersonal, yet highly expert and laborious, being given without any inducement save public spirit and honorable distinction.

Among the public services which are municipally controlled and managed in Liverpool only the more important can be described here. The Electricity Supply Department of the City Council took over by purchase in 1896 the undertaking of a private company which had operated in the city from 1883. The purchase price was £400,000 and the business had then a total plant capacity of 10,000 horse power. The pressure of supply was 110 volts. Immediately on taking over the system the municipality increased the pressure, and erected new generating stations. On Dec. 31, 1905, the capital expended amounted to £1,849,775, and the surplus profit, after paying all working costs and charges for interest and sinking fund for the year 1905, exceeded £50,775—a large portion of which was handed over to the general fund of the city in reduction of rating. During the year 1905 the department supplied in lighting and power, including supply to the Tramway Department, a total of 31,452,323 units at a charge which averaged 3.172d. per unit to private users, 2d. per unit for public purposes other than tramway power, and 1.107d. for tramway power. The charges have been several times reduced since the service was municipalized. The department is at present (1906) considering a scheme for supplying motors to small workshops on the hire system in order to increase the use of electricity for industrial purposes.

The Tramway Department has been similarly successful. Taking over by purchase in 1897 the undertaking of a joint stock company, the city speedily converted the horse tramway into an electric system. The capital expenditure Dec. 31, 1905, stood at £1,898,812, and the length of track operated was 104 miles. The surplus, after paying interest on loan capital, and setting aside sinking fund and depreciation, reserve, and renewal funds, amounted in 1905 to £27,108, which was transferred to general rate account and there served to reduce the rates levied upon the citizens. The success of the municipal tramway undertaking was achieved upon fares greatly reduced (a passenger is carried two miles and a half for 1d.), wages of em-

ployees increased, and hours of labor shortened by about one third.

The proper housing of the poorer citizens has for many years exercised the ingenuity of the Liverpool City Council. As far back

Housing as 1869 six blocks of cottages, known as St. Martin's Cottages, were erected out of funds of "Capital Personal Estate" belonging to the city. At a later period extensive clearances of slum property were made and the cleared sites were offered for sale on condition that workmen's dwellings at cheap rents should be erected. No purchaser coming forward, the City Council proceeded to erect the Victoria Square Dwellings and the Juvenal Street Laborers' Dwellings (371 tenements in all). These were opened in 1885 and 1890. It was found that, owing to the rent charge being somewhat higher than that of the demolished property, the new dwellings were tenanted by a class of workers superior to the former tenants of the site, the latter being crowded together in "sublet" houses in the neighborhood. It was felt to be desirable to rehouse the poorest of the poor, and eventually a new type of dwelling was designed—plain, but substantial and thoroughly sanitary—in which it was possible to accommodate the former tenants of the slum at a rent averaging about 1s. per room. A large number of dwellings have now been built, and the greatest care is taken to let these corporation tenements only to tenants who have actually been dispossessed or are about to be dispossessed by the slum demolitions of the City Council. Modifications of the original design are frequently made in the direction of greater comfort and convenience. In 1905 the Eldon Street Dwellings were opened. These houses, three stories high, comprising twelve three-roomed tenements, were built of crushed clinker (from the Council's refuse destructors) and Portland cement, molded into slabs, each slab forming a complete side or roof of a room, openings for doors and windows, as well as fireplaces and flues, being formed in the molding. The staircases, balconies, and chimneys above the roof are similarly molded in blocks. Owing to the difficulty and expense of transporting and hoisting the heavy slabs, this small experiment proved to be expensive. On a larger scale, however, it is expected to work out cheaper than the ordinary brick and mortar dwelling.

According to a report dated March 21, 1906, the Council had erected 1,820 tenements in all, with 4,359 rooms. The cost or valuation of the land for housing purposes and the cost of buildings amounted together to £356,705. The gross annual rental was £17,799. There were also in course of erection or projected, 340 tenements consisting of 951 rooms. For the year 1905 the net receipts, after deducting repairs and expenses, were £7,312—a little over 2 per cent on the capital outlay. It will be seen therefore that the result is not sufficient to pay interest and sinking fund, and the housing scheme thus necessitates a small charge upon the rates.

The Council has hitherto confined its building operations to the central part of the city. It will before long be compelled to turn its attention to the suburbs where private builders are erecting houses which are likely to deteriorate into slums in a very few years. During the last half century many building by-laws have been made to check the tendency to overcrowd the houses

upon a given area, but much remains to be done. Reformers are demanding increased powers for controlling the planning of streets and building areas on the outskirts of great cities so that ample space shall be secured about every dwelling.

Besides the important departments mentioned above, the city owns landed estate yielding about £100,000 per annum; it has constructed important engineering works for the purpose of procuring a constant and plentiful supply of pure water from the mountains of Wales; it owns and manages six markets which bring in a net revenue of £16,000 a year; it manufactures paving slabs from street refuse; it owns and works two large sewage farms producing crops of rye-grass, cabbages, potatoes, mangel-wurzels, and beet-root, the income from the produce covering the expenses of the farms; it paves its own streets and constructs its own sewers; it collects and disposes of all the refuse of the streets and houses; it constructs its tramways and repairs the cars. Besides these useful undertakings the city provides parks, gardens, recreation grounds, botanic gardens, palm-houses, aviaries, museums, art-gallery, libraries, baths, wash-houses, hospitals, and convalescent homes for the pleasure, health, or instruction of the citizens. Liverpool municipal effort has also largely contributed to the founding of the local university; and numerous elementary and secondary schools, technical schools, a nautical college, industrial schools, are controlled and managed by the City Council. A very recent departure was the establishment of depots for the sale of sterilized milk for infants. It is hoped by this venture to reduce the rate of infant mortality. In addition to the constructive work carried on directly by this enterprising municipality, there is a vast amount done in the way of inspection of private enterprise. A bacteriological department analyzes food and drugs; the medical officer's department inspects bakehouses, common lodging-houses, canal-boats, shippens, milk-shops, insanitary property, workshops where offensive trades are conducted, and endeavors to diminish the smoke nuisance. A special staff of female sanitary inspectors is occupied in visitation among the poorer classes in order to instruct mothers in the care of infants; they also inspect workshops where women are employed, assist the Police-Aided Clothing Association in clothing poor children, and render other useful services.

JOHN EDWARDS.

LLOYD-GEORGE, DAVID: President of the English Board of Trade (1905) and M.P.; born in 1863, at Manchester, England; educated in the Church School at Llanstymdury and privately. Read law and was admitted to practise as a solicitor in 1884. An eager and enthusiastic Liberal, Mr. Lloyd-George has always been active in politics and has had a most strenuous career. In 1890 was elected to Parliament for the Carnarvon District, North Wales. At the defeat of the Conservatives and the coming in of the Liberal Party in 1905 he was given a portfolio as President of the Board of Trade in the new

cabinet formed by Sir Henry Campbell-Bannerman. Address: Brynawel, Criccieth, Carnarvon, Wales.

LLOYD, HENRY DEMOREST: Socialist author; born New York City, 1847; educated public schools, Dr. Anthon's School, and Columbia College, class of '67. Studied at Columbia Law School, LL.D.; admitted to New York bar in 1869 and to bar of Chicago in 1872, but never practised. In 1871 he took an active part in the overthrow of Tammany and the Tweed Ring. He was secretary of the American Free Trade League, 1868 to 1872. Delegate for New York to Liberal Republican Convention at Cincinnati in 1872 he opposed the nomination of Horace Greeley. From 1872 to 1885 he was successively literary and financial editor and editorial writer on his *Chicago Tribune*, beginning here his study and observation of the great industrial combinations then forming. In 1881 he published "The Story of the Great Monopoly," the first arraignment of the Standard Oil Company and the railroads in granting it discriminating rebates. This was followed by other articles in like vein, notably "The Lords of Industry." He endeavored to save the lives of the Chicago anarchists, thinking them unjustly condemned. Lloyd gave much time to active work in the labor struggles of his time, was counsel for the Anthracite Miners before the Coal Strike Commission in 1902, and worked earnestly in 1903 for public ownership of the street railways of Chicago. It was in these last labors for the people that he contracted the illness of which he died in Sept., 1903. He was a radical opponent of the private use of public wealth, believing that the producers should own the wealth they produced. His ideals worked toward a cooperative commonwealth where social love would replace the present strife, and could see no limit to the development of man, who in his function of creator is to redeem both himself and society. Politically he believed party to be a necessary evil for the present and had determined to join the Socialists as being the only party which avowed a social ideal, international as well as national, and offered a program for the next great step, namely—the extension of the democratic principles to industry. In addition to the works already mentioned he wrote "Wealth Against Commonwealth"; "Labor Co-partnership"; "A Country Without Strikes"; "Newest England," etc.

LOBBY: "The lobby" is the name given to persons who undertake to influence the members of a legislature and thereby to secure the passing of bills. The term includes both those who, since they hang about the chamber, and make a regular profession of working upon members, are called "lobbyists" and those persons who on any particular occasion may come up to advocate, by argument or solicitation, any particular measure in which they happen to be interested. The name, therefore, does not necessarily impute any improper motive or conduct, tho it is commonly used in an unfavorable sense.

Says Mr. A. R. Spofford, Librarian of Congress, in the *American Cyclopaedia of Political Science*, article "Lobby":

What is known as lobbying by no means implies in all cases the use of money to affect legislation. This corruption is frequently wholly absent in cases where the lobby is most industrious, numerous, persistent, and successful. By casual interviews, by informal conversation, by formal presentation

of facts and arguments, by printed appeals in pamphlet form, by newspaper communications and leading articles, by personal introductions from or through men of supposed influence by dinners, receptions, and other entertainments, by the arts of social life and the charms of feminine attraction, the public man is beset to look favorably upon the measure which interested parties seek to have enacted.

Unfortunately, however, the lobby usually degenerates till it is mainly a lobby in the bad sense. This results almost inevitably from methods of legislation, particularly in the United States. In the U. S. legislatures all business goes before committees—not only private bills, but public bills—often involving great pecuniary interests. To give a bill a fair chance of passing, the committee must be induced to report in favor of it. The committees have no quasi-judicial rules of procedure, but inquire into the subject, and usually by giving hearings on the subject to interested parties. If the committee can be gained the bill usually passes. The fate of a bill, therefore, often really lies in the hands of a few men, tho the responsibility can be thrown on the whole legislature. This gives enormous opportunity for corruption. Great corporations are sometimes interested to the extent of millions on the wording of a bill. Politicians of the lowest type can, therefore, get large bribes from corrupt corporations. This all but compels other corporations to bribe likewise. If the corporation does not, the corrupt corporation will gain the legislation. As a result, the average corporation that seeks a bill goes to the legislature with money in its hand, and still oftener it goes with money to buy off legislation that would injure, legislation often simply introduced to make the corporation pay for preventing its passage, or legislative blackmail. The corporation often has to spend money to gain a perfectly just and right bill. It is on this all but inevitable result of present industrial and commercial methods that the lobby fattens. Nor does the money always need to be corruptly spent. A sharp lobbyist, who knows the ins and outs of legislative practise, who knows many of the legislators, who knows who is corruptible and who not, who knows how to bring political influence to bear in this way or that, can often obtain or defeat legislation without the use of money. He may sell his influence, and the corporation money go into his pocket without his buying the legislators. It is in such ways that around almost all American legislatures has grown up "a third house," which is sometimes more influential than the other two. (See CORRUPTION.)

Efforts have been made to check the practise of lobbying, both in Congress and in state legislatures. Statutes have been passed severely punishing any person who offers any money or value to any member with a view to influence his vote. It has been repeatedly held by the courts that "contracts which have for their object to influence legislation in any other manner than by such open and public presentation of facts, arguments, and appeals to reason as are recognized as proper and legitimate with all public bodies must be held void."

It has been attempted to lessen lobbying by restricting the legislatures. Some states enacted a law compelling all lobbyists to be registered, that it may be known who they are and whom they represent, and exacting an account of all money spent in lobbying. Lobbies have been formed to represent the public interest, but they have no definite organization.

LOCAL GOVERNMENT IN ENGLAND: Perhaps the most concise way of stating the present position of local government in England is to give the chief items in the accounts of the money received and spent by our local councils. The following figures are taken from the "Annual Report of the Local Government Board, 1905," which deals with the financial year 1902-3. The total receipts of local authorities in England and Wales were (the earlier figures are given for comparison):

| | | | |
|--------------|-------------|-------------|--------------|
| 1879-80..... | £52,600,000 | 1901-2..... | £121,500,000 |
| 1900-1..... | 111,900,000 | 1902-3..... | 129,000,000 |

Analysing the last year's accounts more closely we find that the total included receipts from:

| | |
|---|------------|
| Rates, £50,000,000 (as compared with £22,000,000 in 1879-1880). | |
| Gas..... | £7,000,000 |
| Water-works.... | 4,000,000 |
| Tramways..... | £3,750,000 |
| Electricity..... | 1,750,000 |

The total expenditure of these local authorities for this same year 1902-3 was £128,960,000; made up of the following chief items:

| | |
|----------------------------------|-------------|
| Repayment and interest of loans. | £20,250,000 |
| Highways..... | 16,600,000 |
| Poor relief..... | 15,500,000 |
| Education..... | 13,300,000 |
| Tramways..... | 7,000,000 |
| Gas..... | 6,300,000 |
| Water..... | 6,000,000 |
| Police..... | 5,900,000 |
| Electricity..... | 5,300,000 |
| Sewage..... | 4,500,000 |

The loans outstanding at the end of the year amounted to £370,500,000. All the above figures clearly demonstrate the vast increase in the importance of local government activities and the enormous nature of the sums already involved. It is useful to remember that the national revenue of Great Britain in 1903 was £151,550,000; while the national debt stood at about £650,000,000. There are periodicals, perhaps incessant, outcries that the local councils are spending too much money, but this is mainly the criticism of irresponsible persons who do not know the facts. The rational citizen has quite decided that the local councils are making a profitable use of the public money; and that an active policy on the part of the councils is an essential part of civilization. "Municipal trading" is pushing out its boundaries every day, just because it has been demonstrated beyond dispute that the public interest is better served by a public council than by a private company whose chief object is private gain.

Such being, in barest outline, the statistical facts of English local government, it remains to point out the more important problems which arise in this department of our public affairs. There are two problems which most urgently call for solution.

(1) *The law concerning English local government is in a state of extreme confusion, and must be made precise and clear.* It is a rash deed to write down a generalization from the data of social science, but we may say that the

Problems Municipal Corporation Act of 1835 was the first attempt to reduce medieval chaos to modern order in the affairs of local government. Until 1835 the power of local government had been the power to govern a neighborhood as the authorities of that place pleased; there was little attempt to force them to consider the wider interests of the whole nation; each borough had its own customs. The

Act of 1835 laid down a uniform code which was to apply to the bulk of the boroughs of England. This modern process of national uniformity has been continued and extended until at the present time we find our local affairs in the hands of various public bodies (Parish, District, both urban and rural, Borough, and County Councils, Boards of Guardians, and Magistrates), who are called to administer their duties under the terms of comprehensive acts of which the chief are the Local Government Acts of 1888 and 1894, the Municipal Corporations Act of 1882, and the Public Health Act of 1875. So far stated the position seems fairly simple, but closer examination reveals a very remarkable state of things; for example, the Public Health Act, 1875, requires 2,200 closely printed pages of notes and references to over 600 other acts of Parliament to explain its meaning. It is necessary to read innumerable acts of Parliament besides the Municipal Corporations Act before a citizen can understand the powers of borough councils. Besides the main Poor Law Acts of 1601, 1834, and 1868, there are 400 other acts bearing on the subject and explained in 1,800 reported cases. The law of rating is scattered in almost 100 acts and 1,200 cases. Further, special subjects of local government are dealt with by separate acts on tramways, electricity, gas, water, small holdings, allotments, housing for the working classes, burials, police, highways; to enter the domain of local government is immediately to be faced by a long row—many long rows—of acts of Parliament and law books. The layman is helpless in this confusion; be it whispered, the lawyer is often hard prest for an answer. If the people are to govern, if democracy is to be aught but a theory, then the law must be made infinitely more understandable. It must be still more codified and also revised toward more simplicity. There is, for example, no need for district councils; their work could be easily distributed between the Parish Councils and the County Councils. The District Council area is too small for economical administration; it is too large for its members to intimately know the needs of the inhabitants. Then the Boards of Guardians must be abolished and their duties handed over to the County Councils. Come what may, simple law is the price of democratic control.

(2) *The complicated business of local government must ultimately be conducted by the professional expert. The problem before the elected councilors is how to choose the expert official.* It is clear, for example, that the best managers of the city tramways, the electricity supply station, the municipal water-works, are not likely to be chosen by way of the ballot-box; the matter requires detailed discussion which would not be appropriate to the election platform. We must learn to conduct our public affairs as men of sound business sense. The problem is exactly the one before the shareholders in a private company. It is perhaps the greatest merit of the Education Act of 1902 that it will serve as a model for future local government in England. Its "Education Committee" system seems the most hopeful method of finding the proper officials. This system is, briefly, the County Council appoints a number of its own members to sit as an Education Committee; and also coopts a certain number of persons who have special knowledge of education; the whole committee controls the education of its area through the officials whom it selects. This judicious com-

bination of members elected directly by the people and members chosen, indirectly, for their special knowledge, is the basis of a new method in local government, which is perhaps its most significant recent development. The other important fact in this Education Act is that it selects the County Council as the proper authority to undertake great public affairs. No other local governing area is large enough to pay for the very best men or to administer with the utmost economy. The County Council is marked out as the most important administrative body in future English local government.

G. R. S. TAYLOR.

LOCAL GOVERNMENT INFORMATION BUREAU, THE: This bureau, conducted by the Independent Labor Party, and the Fabian Society of London, England, was formed for the purpose of giving information on the work and powers of municipal bodies, boards of guardians, and other local authorities. The bureau has not been long in existence, and unfortunately is not so well known as it should be; nevertheless the continued prosperity and widening usefulness of the society shows how deeply the work done for its members is appreciated. Address: The Fabian Society, 3 Clements Inn, Strand, London, W. C.

LOCAL OPTION: The privilege granted to a political division, as a county or town, of determining whether the sale of intoxicants shall be prohibited within its limits. Local option is prohibition brought down to the level of a workable public sentiment. The difference between the local optionist and the extreme prohibitionist is not in kind but in the size of the political units. Local option crystallizes public sentiment in a given community and brings it to bear upon the liquor question for immediate results. State-wide prohibition is after all but a large kind of local option.

The principle of local option does not refuse to abolish saloons where it can, because it cannot yet abolish them everywhere it would. It is sometimes argued that local option is a compromise with evil. This is not the case. It is prohibitory to the full extent of the public sentiment existing.

It is likewise argued that the saloon is an evil demanding the enactment of prohibitory laws the same as theft or murder. But persons presenting this argument forget that all agree that to steal or murder is wrong, but all do not agree that the traffic in intoxicating liquors is wrong. Vast numbers of our population, who must be regarded as good citizens because they are thrifty and law-abiding, do not believe that the traffic in and use of intoxicating liquors is wrong. With these people a long course of education is necessary to bring them to a full realization and recognition of the immorality and crime attendant upon the traffic in intoxicating liquors.

There are few better methods of education for accomplishing this work than the operation of the local-option principle. The agitation leading up to the annual or biennial local-option elections in the different political units is of immense educational value, and furnishes its advocates frequent and full opportunities for the discussion of the prohibition principle. Every municipality, township, or county that abolishes the saloons is, by the beneficial effects of this act,

a standing argument for the extension of the principle to the larger political units. As the steam in the boiler increases in pressure with the action of the engine, so does the public sentiment of the people develop in proportion to the frequency of the opportunities of putting it into effective operation.

The solution of the liquor problem is too great a task to be accomplished by any one church or political party. We are coming steadily to recognize the necessity of bringing to bear upon it the mobilized public sentiment of all churches and all parties. This can be done only by the separation of the question from all other essential public and political issues of government. Such a separation allows the Church to assume its proper place in the problem of temperance reform, and furnishes frequent opportunities for the exercise of its gifts and graces.

Again, laws abolishing the liquor traffic are not self-acting. No law is operative that has not a public sentiment behind it. The merits of local option may be seen most clearly in what has already been accomplished. The states of Louisiana, Kentucky, Florida, Texas, West Virginia, Virginia, Tennessee, Alabama, Arkansas, Georgia, North Carolina, Mississippi, and South Carolina, containing a population of 27,000,000,

Extent

taken as a whole are in point of territory seven eighths prohibition. This has been brought about entirely through local-option laws. In many of the Northern states from large and increasing territory the saloon is being abolished by the application of improved local-option laws which are being enacted by the various state legislatures. While the South is much in advance of the North because of the absence of the foreign population, nevertheless most rapid strides are being made in most of the Northern states. Ohio, for example, which because of its many large cities ranks third or fourth as a saloon state, is rapidly abolishing the traffic. Of the 1,371 townships in the state nearly 1,100 of them have abolished saloons. Of the 763 incorporated villages and cities about 470 are now dry.

The effort to put these local-option laws in operation has developed a sustained public sentiment, which in most instances compels the enforcement of the law. It has unified and given direction to the efforts of the Church against the liquor traffic. The operation of the law makes possible increased legislation for its application to still larger political units. Hence we conclude that local option is the gradual and natural approach to the ultimate overthrow of the beverage liquor traffic. (See TEMPERANCE.)

PURLEY A. BAKER.

LOCAL PROHIBITION: Term commonly applied to the policy of refusing license to sell intoxicating liquors in municipalities, townships, and counties. It commonly rests upon state statutes giving subdivisions to the state local option (that is, local choice). In a few cases local prohibition is secured for some community by direct act of the legislature, and in some cities, for example Chicago, sections are sometimes placed under a prohibitory policy by the city council. The earliest local option in America was granted in Indiana by the laws of 1832. In 1833 the legislature in Georgia gave local option, to be exercised by the local courts, to two counties in that state. Between 1833 and 1850

many communities in different states secured the right and voted out the legal traffic in liquor. With the rise of the idea of state prohibition interest in local prohibition grew less and was heard of again but little, until after the Civil War. New York readopted a local-option system in 1873, and it has come to be part of the laws of the majority of the states. The theory has three classes of advocates: temperance people who seek to obtain some advantage against the saloon without encountering partizan opposition; politicians who welcome it as an outlet for temperance sentiment without disturbance to party politics; liquor dealers who accept it as a last resort to segregate dangerous temperance sentiment and ward off prohibition of wider extent.

The growth of the Anti-Saloon League, which works almost solely for local prohibition, has caused a wide revival of interest in the subject during the last ten years. The league has introduced the idea of option by "residence districts" in cities, and in the State of Ohio has secured legislation with such provisions.

It needs to be noted that local prohibition deals only with the local evils of the liquor traffic and makes no attempt to cope with its wider financial and political problems. The manufactures and products of a no-license town are sold in license cities in competition with the saloon. The no-license town shares in the bad government made inevitable by the debauchery of politics by the liquor traffic. The youth reared amid clean surroundings go out to find the temptations of the saloon as soon as they pass beyond the shadow of the hearth-tree. Excepting a few of the Southern states, local prohibition has never approached the removal of the saloon from a whole state, and even in the South the centers of population and influence are commonly held by the saloon, either by legal provisions that deprive cities of option on the question, or through the control of the cities by the saloon element.

In favor of the local prohibition theory its advocates urge the principle of "home rule"; against the adoption of local prohibition, the liquor interests present the usual contention of tyranny and alleged "failure."

Radical Prohibitionists deny the right of the legislature to grant local option to a town or county, asserting that the sale of liquor is no more a question for local determination than is horse stealing or the propagation of typhoid fever. The Prohibitionists insist also that, by means of local prohibition, the public conscience is saved, and that the citizens of no-license towns or counties, relieved of the more repulsive manifestations of the liquor traffic, lose sight of its wider evils and forget their responsibility for the state and national features of the problem. Local option being granted, however, Prohibitionists commonly favor the use of the opportunity to perform what they consider a duty neglected by the legislature.

Of the local advantages of local prohibition there has never been ground to doubt, whenever the policy has had opportunity for fair test. No-license towns and no-license cities, compared with license towns and cities, invariably show less crime, less pauperism, and commonly a better condition of public health. Massachusetts has furnished numerous illustrations, the most marked being instances in which in alternate years the same city has had license and no-license. Interesting literature upon this question

is published by the National Temperance Society of New York.

The table which follows shows, with substantial accuracy, the degree to which local prohibition prevails in the principal states. Absolute accuracy is almost impossible, since the facts are not recorded in many states, the local authorities having little control. Colorado and Oregon have newly adopted local-option laws, and Delaware, in which there is already considerable prohibition territory, is upon the eve of a local-option election which is expected to eliminate the saloon from almost the whole state. Georgia, which has just adopted a state prohibitory law, had 125 of its 146 counties under local prohibition before that law was adopted.

| STATE | Number of counties, towns, cities, etc. | Number under local prohibition |
|---------------------|--|---|
| Alabama..... | 66 counties | 20 |
| Arkansas..... | 75 counties | 56 |
| California..... | | Parts of some 8 or 10 counties |
| Connecticut..... | 168 towns | 89 |
| Delaware..... | | About one half the state |
| Florida..... | 46 counties | 35 |
| Illinois..... | | 10 counties, 500 cities and villages, half of Chicago |
| Indiana..... | | About 150 towns |
| Iowa..... | 99 counties | 56 |
| Kentucky..... | 119 counties | 87 |
| Louisiana..... | 59 parishes | 18 |
| Maryland..... | 23 counties | 14 |
| Massachusetts..... | 33 cities | 19 |
| Michigan..... | 1321 towns | 249 |
| Minnesota..... | 83 counties | 1 and a few towns |
| Mississippi..... | 77 counties | About 1/2 of the rural districts |
| New Hampshire..... | 11 cities | 6 |
| New Jersey..... | 224 towns | 183 |
| New York..... | 933 towns | About 200 towns and cities |
| North Carolina..... | 97 counties | 308 |
| Ohio..... | 768 towns | 70 |
| Pennsylvania..... | | 480 |
| South Carolina..... | 41 counties | 1 county and a few towns |
| South Dakota..... | | 18 towns |
| Tennessee..... | All the state under local prohibition except 5 municipalities. | Possibly 15 per cent of the state |
| Texas..... | 243 counties | 140 and parts of 55 |
| Vermont..... | 6 cities | 3 cities |
| Virginia..... | 241 towns | 208 towns |
| West Virginia..... | 100 counties | 72 |
| Wisconsin..... | 55 counties | 22 |
| | 118 cities | 5 |
| | 206 villages | 16 |
| | 1,104 towns | 223 |

Oklahoma, which may be admitted to the union as a prohibition state, has many towns under local prohibition. In judging the value of local prohibition indicated in the table above it must be remembered that a very large part of the townships and counties mentioned lie in close

proximity to license territory. For example, many of the no-license towns of Wisconsin contain license villages. In New Hampshire the excise boards are empowered to grant hotel licenses in towns that vote no-license. In New York, where there are 308 no-license towns, it is possible in only two small sections of the state to establish a home fifteen miles away from a saloon.

WM. P. F. FERGUSON.

LOCKE, JOHN: Philosopher; born at Wrington, Somersetshire, England, in 1632. His father, a small landowner and attorney at Pensford, was a strict but genial Puritan. "From the time that I knew anything," Locke wrote in 1660, "I found myself in a storm which has continued to this time." Entered Westminster School, and in 1652 went to Oxford. Took his degree of A.B. in 1656, A.M. in 1658; made tutor of Christ Church in 1660, and lectured in Greek, rhetoric, and philosophy the following year. Locke was particularly attracted to the works of Descartes, which first gave him a taste for philosophical subjects.

In 1673 became secretary of the Board of Trade under Earl of Shaftesbury.

Among the writings of Locke during this period is an essay on the "Roman Commonwealth." But the most significant of all is an "Essay Concerning Toleration" (1666).

The fall of Shaftesbury in 1675 enabled Locke to spend four years of quiet in France, at which time at intervals his "Essay on the Human Understanding" was in process of construction, and here he enjoyed the society of distinguished men of letters and science; returned to London in 1679. After Shaftesbury's second downfall Locke retired in voluntary exile to Holland. The "Essay" was finished in 1687. He returned to England in 1689, and his fame as an author was established throughout Europe. He declined the embassy to Brandenburg, and accepted instead the modest office of commissioner of appeals. While in London (1689-90) he published his chief works on social polity, the "Epistola de Tolerantia," address to Limborch, and the "Two Treatises on Government," in defense of the sovereignty of the people; his "Essay on the Human Understanding" appeared in 1690. Locke died Oct. 28, 1704, at Oates, in Essex, where Sir Francis Masham had given him a home for many years. He passed away, as he declared, "in perfect charity with all men, and in sincere communion with the whole Church of Christ, by whatever names Christ's followers call themselves."

Locke is of importance in social reform because he is the intellectual father of the eighteenth-century philosophy, which, in France particularly, produced revolutionary ideas. Says Cousin:

Placed between the seventeenth and eighteenth centuries he forms the transition from one to the other. In fact, run over all the sensualistic philosophers of the eighteenth century, there is not one who does not invoke the authority of Locke, and I do not speak merely of metaphysicians, but of moralists, publicists, and critics.

The essence of Locke's philosophy is that there are no "innate ideas." He says:

Let us suppose the mind to be, as we say, white paper, void of all characters, without any ideas: how comes it to be furnished? Whence has it all the materials of reason and knowledge? To this I answer, in one word, from experience; in that all knowledge is founded, and from that it ultimately derives itself ("Essay on the Human Understanding," Book II.).

From his standpoint materialistic and un-Christian philosophers argued, as Locke did not, an individualistic revolt against the authority both of State and Church. As Locke in his "Civil Government" argued against arbitrary rule, they argued against all rule. (See POLITICAL SCIENCE; NATIONAL LIBERTY.)

LOCKWOOD, BELVA ANN BENNETT Mc-NALL: Woman suffragist; temperance reformer; born in Royalton, N. Y., 1830; graduated Genesee College, 1857; A.M. Syracuse University, 1871; graduated National University Law School, 1873. In 1879 secured passage of bill admitting women to United States Supreme Court. Mrs. Lockwood was attorney of record for 6,000 Eastern and emigrant Cherokees, carrying her case successfully through Congress, the U. S. Court of Claims, and the Supreme Court of the U. S., making extended legal arguments before these bodies with the result that the Supreme Court gave judgment for the Cherokees *versus* the U. S. in the sum of about \$5,000,000; secured passage of bill in 1873 giving to women employees of the government equal pay with men for the same work; and with others, in 1896, a bill giving to women of the District of Columbia equal property rights, and equal guardianship of their children, with men; six times a delegate to Universal Peace Congresses held in Europe. Mrs. Lockwood was nominated at San Francisco in 1884 by the Equal Rights Party for the Presidency of the U. S., and again by the same party in 1898 at its convention in Des Moines, Iowa. She has written many articles and brochures on peace and arbitration, and notably an exhaustive paper on "The Legal and Political Status of the Women of the U. S.," published in the Swiss *Jahrbuch* of 1897. Address: 619 F Street, N. W., Washington, D. C.

LODGING-HOUSES: In every great city the cheap lodging-houses where the homeless poor can pass a night if they are not yet absolutely destitute or dependent upon charity, are among the most wretched spots to be found, and often centers of vice, if not of crime. In Germany, and to a less extent in the United States and other countries, however, clean and cheap lodging-houses have been opened by private charity. New York has some 105 such houses accommodating 16,000 lodgers.

The best known examples of these are the two Mills hotels, in New York City, erected by the philanthropy of Mr. D. O. Mills, and giving attractive hotel accommodation for 2,250 men for twenty-five to forty cents per night. Yet they have paid a fair return.

Boston, New York, Chicago, and other American cities have also established municipal lodging-houses where those who cannot pay can do some work, like splitting wood, and are aided in securing work.

Municipal lodging-houses are found in almost all English cities.

As long ago as 1853 Huddersfield established a municipal common lodging-house, and twenty years later Glasgow tried the same experiment on a larger scale. Since 1879 the corporation has maintained six lodging-houses for men and one for women, in which beds are let at from 3d. to 4½d. per night. Merely as a commercial experiment this proved a success. The result upon the character of the inmates is, however, far more important than any pecuniary result. These

municipal lodging-houses are admirably managed; there is a recreation room, in which lectures are delivered, and music produced, while all possible facilities are provided for washing clothes, cooking, etc.

Paris has three institutes (*refuge de nuits*) absolutely free and where the unemployed are helped to find work.

For Germany, see RELIEF SHELTERS.

The Salvation Army in most cities, the Church Army in London, and similar religious organizations in various cities maintain many such shelters, for ten cents a night, or fifteen cents with a breakfast.

LOMBROSO, CESARE: Specialist in insanity and criminal anthropology; born at Venice, 1836; studied medicine at Turin, and entering the army in the campaign of 1859, was soon made surgeon. In 1862 he took a professorship in diseases of the mind at Pavia, and later became director of an establishment for the insane at Pisaro. From here he went to Turin as professor of medical law and of psychiatry. He has written many works, particularly on criminology (*q. v.*) and criminal anthropology (*q. v.*), on which he is a leading authority. Address: 26 Via Lequano, Torino, Italy.

LONDON: London is of special interest in social reform because of its size, giving its social problems an extent which compels attention, and because of its importance, as in a sense the commercial metropolis of the world. "A province covered with houses," it exceeds all Ireland or Scotland in population. It is the largest city in the world.

Originating, it is supposed, in the Celtic *Llyndin* (Lake Fort), Latinized into *Londinium*, Tacitus mentions it in 61 A.D. as a trading center. In 809 it was the capital of the East Saxons, and was made by William the Conqueror, (1066) the capital of England and given a special charter. Since then it has steadily grown, and latterly by absorbing whole towns and villages, as will be seen by the following table:

| Year | Population | Percentage of England |
|-----------|------------|-----------------------|
| 1350..... | 90,000 | 3.60 |
| 1600..... | 180,000 | 3.27 |
| 1700..... | 350,000 | 9.10 |
| 1801..... | 864,055 | 9.72 |
| 1851..... | 2,362,237 | 13.18 |
| 1881..... | 3,814,577 | 14.69 |
| 1891..... | 4,232,118 | 15.39 |
| 1901..... | 4,536,541 | 14.49 |
| 1906..... | 4,721,227 | 14.59 |

| POLICE DISTRICTS | POPULATION | |
|-------------------------------|------------|-----------|
| | 1891 | 1901 |
| County of London..... | 4,190,615 | 4,509,618 |
| 60 parishes in Middlesex..... | 542,894 | 792,316 |
| 39 parishes in Surrey..... | 295,759 | 384,539 |
| 19 parishes in Kent..... | 117,121 | 151,066 |
| 15 parishes in Essex..... | 413,679 | 672,184 |
| 16 parishes in Herts..... | 36,036 | 44,736 |
| City of London..... | 37,702 | 26,923 |
| Total: "Greater London"..... | 5,633,806 | 6,381,372 |

The name London was formerly only applicable to the City with an area of a little over one square mile, and the outside districts grew up without any homogeneity and without a common name until 1855, when they became officially known as the Metropolis. This area became in 1889 the administrative County of London, 118 sq. m. in extent, and as such includes the City, in which, however, certain services are performed by the Corporation which are in the rest of the county performed by the County Council. The administrative County of London had in 1901 a population of 4,536,541.

Greater London or the Metropolis under the Metropolitan and the City Police is made up of all parishes of which any part is within eleven miles of Charing Cross, or of which the whole is within fifteen miles of Charing Cross. It is 693 sq. m. in extent and contains a population of (1906) 7,113,561.

London, except the square-mile City, had no unity of government (which was till 1855). But by the Metropolis Management Act

Admini- stration

of 1855, a comprehensive system of local administration was provided for the parishes. The ratepayers of each parish elected a vestry of from 18 to 120 members, to whom were added the rector, churchwardens, and in some parishes the district rectors also. In twenty-three cases these bodies were administrative vestries which were given direct control of the local sewers, roads, sanitation, etc. The remaining parishes were grouped into fifteen districts under the administration of district boards appointed by the parish vestries.

At the head of the system was the Metropolitan Board of Works. It consisted originally of forty-five members, appointed by the City Corporation, the twenty-three vestries, and the fifteen district boards.

Between 1855 and 1888 many changes were made in the details of the Metropolis management system in the direction of direct representation and the constitution of manageable areas. The franchise, too, was extended to that of parochial voters.

The London Government Act of 1899 abolished the vestries and district boards and the parish overseers outside the city, and created the metropolitan borough councils.

The reform of 1899 still left nearly 300 different authorities engaged in the work of public administration in London. The following are the authorities:

London County Council, elected by parochial electors.
Common Council of the City of London, elected by City voters.

Twenty-eight Metropolitan Borough Councils, elected by parochial electors.

Commissioners of Metropolitan Police, appointed by the Home Office to perform functions which in the City of London and everywhere else in England are in the hands of the county or municipal authorities.

Metropolitan Asylums Board, appointed by the Local Government Board and the Boards of Guardians to provide Imbecile Asylums and Fever Hospitals.

Two Sick Asylums Boards, appointed by certain Boards of Guardians to make joint provision for infirmaries.

Four School District Boards, appointed by certain Boards of Guardians to provide joint poor-law schools.

Thirty-one Boards of Guardians, elected by the parochial voters to administer the poor-law.

One hundred and twelve Vestries of City Parishes.

One hundred and fourteen Boards of Overseers of City Parishes.

Metropolitan Water Board, appointed by the County Councils, Metropolitan Borough Councils, Municipal Corporations, and Urban District Councils in the metropolitan water area.

Thames Conservancy Board.
Lea Conservancy Board.

The jurisdiction of the last three bodies and of the police, however, extends far beyond the County of London.

The County Council authority extends over the City for some common purposes, but not for all, while the City Corporation has jurisdiction within the County of London and beyond for markets and port sanitation.

Since the passing of the Local Government Act of 1888 more than 200 measures have been placed upon the statute book giving further powers to the County Council.

In 1903 a bill was passed for the abolition of the School Board and the transfer of the work of that authority to the London County Council, and in December of the previous year a measure was

| | Total expenditure | Receipts in aid | Effect of transfers from local to county funds | DISTRIBUTION OF CHARGE BETWEEN | |
|--|-------------------|-----------------|--|--------------------------------|-------------|
| | | | | Imperial taxation | Rates |
| London County Council: | | | | | |
| General county account..... | £ 2,333,395 | £ 209,181 | + 581,110 | £ 554,104 | £ 2,050,079 |
| Special county account..... | 982,272 | 619,508 | + 71 | 10,837 | 381,659 |
| Equalization fund..... | | | + 993,933 | | 993,933 |

+ Increase.

- Decrease.

passed for the purchase of the London Water Companies' undertakings, and their administration by a Water Board.

No complete statement of the expenditure of all the local authorities in London is regularly published, but many of the details are included throughout the Local Taxation returns for England and Wales, from which, for the most part, the figures on page 729 have been compiled for the last year for which statistics are available.

The total given above does not represent the whole expenditure. There must be added the expenditure out of borrowed capital, amounting (in the same year) to £6,149,204. This gives a gross expenditure of £23,897,845, or about £5 5s. per head of population, of which £3 18s. per head is for current expenditure.

Most of the loans of the other bodies are made through the London County Council, which thus acts as banker to the other public bodies. In March, 1903, 1904, and 1905, the loan liabilities of the Council were:

| | 1903 | 1904 | 1905 |
|---|-------------|-------------|-------------|
| Consolidated stock... | £53,761,638 | £58,761,638 | £63,902,465 |
| London county bills | 1,966,160 | 982,739 | 1,415,294 |
| Former county loans | 171,765 | 143,372 | 117,980 |
| Consolidated Loans | | | |
| Fund advances to capital accounts and to late School Board..... | 896,034 | 854,167 | 3,574,677 |
| Public Works Loans | | | |
| Commissioners' part debt of late School Board..... | | | 2,285,221 |
| Overdrawn balances.. | 831,342 | 389,165 | 291,538 |
| | £57,626,939 | £61,131,081 | £71,587,175 |

There are five electorates in London: (1) the Parliamentary Borough; (2) the Parliamentary County; (3) the County Council; (4) the Parochial; and (5) the Common Council; of these only the County Council and the Parochial franchises are identical. Until 1901 the County Council differed in part from the Parochial franchise; but by the London County Council Electors' Qualification Act, 1900, the two electorates were assimilated. The chief alteration was the addition of lodger service, married women, and ownership voters to the County Council franchise, thereby increasing that electorate. The main conditions for the Parliamentary and County Council franchises are to be householders (or servants) with occupation and residence within the borough for twelve months previous to July 15th, or to be occupiers with occupation within the borough as above and residence within seven miles of the borough for six months previous to July 15th, or to be lodgers with occupation and residence as above in qualifying rooms in one definite place within the borough.

For Parliamentary purposes London is divided into fifty-eight constituencies, with one member each, except the City, which returns

Electorate two members. The total electorate at last election (Jan., 1906) was 620,424. There were no uncontested seats, whereas at the previous general election (Oct., 1900) there were no contests in twelve constituencies. Liberal and Labor candidates polled 250,362 votes, and Conservatives 234,216. The results of the last and five previous elections in London were as follows:

| | 1885 | 1886 | 1892 | 1895 | 1900 | 1906 |
|-------------------|------|------|------|------|------|------|
| Conservative..... | 36 | 48 | 36 | 51 | 51 | 19 |
| Liberal..... | 23 | 11 | 23 | 8 | 8 | 40 |
| Majority..... | 13 | 17 | 13 | 143 | 143 | 211 |

¹Conservative majority.

²Liberal majority.

The Liberal Unionists are included in the Conservatives.

In 1905 there were 894,368 children of the elementary school class in London, and there was accommodation in council schools for 588,703, and in voluntary schools for 209,119—total, 797,822. There were at that date 545 council schools open, and seven projected, which, with the projected enlargements of six existing schools, together will provide 805,606 school places. In addition to the above there are fifty sites for future requirements; the accommodation to be provided has not yet been settled.

In 1885 the average attendance on the board (now L. C. C.) schools was 298,317. In 1906 it was 495,901. For voluntary schools the figures are 167,242 in 1885 and 165,603 in 1906.

In addition there were 185 cookery centers, 144 laundry centers; and 36 housewifery centers, 200 manual training centers, 75 centers for the instruction of mentally defective children, 17 centers for the instruction of physically defective children, 12 centers for the education of the deaf, 10 centers for the blind. The Council has seven industrial schools, two truant schools, three day industrial schools, an industrial home for little boys, and several residential schools for the defective. Secondary schools are also being somewhat rapidly developed.

For higher education the Council has adopted the policy of subsidizing existing institutions, polytechnics, technical institutes, trade and workshop classes, art schools, some eight colleges, several secondary schools.

In 1902 a Metropolitan Water Board was created which in 1903 took over the plants of the private companies, paying the companies £30,000,000 in cash and debentures of £11,000,000, the companies having claimed £50,000,000.

For electric supply and street lighting the Board of Trade can grant orders, to be confirmed by Parliament, for installation by companies or municipal bodies, the preference being given to the latter. Companies once installed cannot be bought out except by friendly agreement for forty-two years, for the "then value," without additional pay for good-will. Some sixteen municipal undertakings have been begun.

London's gas is supplied by three principal gas companies consolidated from fifteen in 1870, which in 1905 received some £6,000,000 with gross profits of some £1,500,000. The price raised from 2s. to 2s. 11d.

As to tramways, of the 120 miles of tramway in London practically all the lines in the County of London have been acquired by the Council. According to the London Manual for 1905, the results have been as follows:

- (1) The relief of rates from the profits of the undertaking.
- (2) The institution of all-night car services.
- (3) The running of workmen's cars at reduced fares.

Municipal Ownership

(4) Reduced fares for ordinary passengers on many of the principal routes.

(5) The removal of advertisements from the windows of the cars.

(6) The institution of a ten-hours day (or sixty hours per week) for all tramway employees.

(7) The recognition of the principle of "one day's rest in seven."

(8) Increased wages for employees.

(9) Provision of uniforms for drivers and conductors.

The tramways, however, as yet play a minor part in London's transit systems. It is estimated that the metropolitan and other railroads bring 1,000,000 people into the city every day. The omnibuses carried 265,500,000 passengers in 1900. Cabs and carriages are very numerous and cheap. The underground railroads carry some 160,000,000 per year.

For the large work done by the London County Council on the housing question, see HOUSING.

But the problem still remains unsolved and acute. (See OVERCROWDING.) The death-rate of London, however, has steadily fallen since the beginning of the nineteenth century. In 1881 the death-rate was 21.6 per 1,000, less than that of the twenty other largest cities of England; in 1899, 19.4, and in 1904 (for administrative county area), 16.1, much less than the birth-rate. Nevertheless conditions are anything but satisfactory. Says a Fabian tract, No. 45 (1904): "As regards the four millions of persons in the metropolis, Mr. Charles Booth tells us that 37,610, or 0.9 per cent, are in the lowest class (occasional laborers, loafers, and semi-criminals); 316,834, or 7.5 per cent, in the next (casual labor, hand-to-mouth existence, *chronic want*); 938,293, or 22.3 per cent, form 'the poor' (including alike those whose earnings are small, because of irregularity of employment, and those whose work, though regular, is ill paid). These classes, on or below the 'poverty line' of earnings not exceeding a guinea a week per family, number together 1,292,737, or 30.7 per cent of the whole population. To these must be added 99,830 inmates of workhouses, hospitals, prisons, industrial schools, etc., making altogether nearly 1,400,000 persons in this one city alone whose condition even the most optimistic social student can hardly deem satisfactory ('Labor and Life of the People,' edited by Charles Booth, 1891, vol. ii., pp. 20-21).

Poverty

The ultimate fate of these victims it is not easy adequately to realize. In London alone, in 1902, no less than thirty-four persons, of whom twenty-four were fifty years old and upward, were certified by the verdicts of coroners' juries to have died of starvation, or accelerated by privation. Actual starvation is, however, returned as the cause of death in but a few cases annually; and it is well known that many thousands of deaths are directly due to long-continued underfeeding and exposure. Young children especially suffer.

"In London one person at least in every four will die in the workhouse, hospital, or lunatic asylum. In 1900, out of 84,534 deaths, 48,955 being twenty years of age and upward, 13,542 were in workhouses, 10,572 in hospitals, and 345 in lunatic asylums, or, altogether, 24,459 in public institutions (Registrar-General's Report)."

London's markets have long been a scandal in

the opinion of the Fabian Socialists. A Fabian tract says:

"The Corporation of the City is the largest owner of London's market property, levying an annual market revenue of about £217,000 against an expenditure of some £95,000 and a payment of £96,000 for interest on market debt. The parish of St. Saviour, Southwark, absorbs a net annual income of over £7,000 from the Borough Market, which is virtually a subsidy levied on London's potato supply in aid of the local rates, and so of the local landlords.

"Out of the total, moreover, the Duke of Bedford draws at least £15,000 a year from Covent Garden; and Sir Julian Goldsmid, M.P., a clear £5,000 a year net rental from his monopoly of the right to hold a market by Spital Church. This is an utterly unjustifiable tax on the food of the people.

"These monopoly rights are derived, not from any express charter or enactment, but by an old inference of the common law. What Charles II. gave to the Duke of Bedford's ancestor and Sir Julian Goldsmid's predecessor was merely the permission to hold a market; it is the lawyers who invented the doctrine that such a permission implies the prohibition of competing markets within about six miles and two thirds."

The London County Council is claiming that the various local authorities have the right to establish smaller retail markets and is taking steps in this direction. Various proposals are being put forth for municipalizing the port of London and buying out the dock companies.

The immense importance of the port of London may be gathered from the fact that the total tonnage entered in 1904 was 17,073,852 tons. Liverpool, which ranks next in the United Kingdom in the quantity and importance of its shipping, had a tonnage entered of 11,083,856 tons. Of continental ports Hamburg comes first with 9,611,732 tons, which is equal to 56.3 per cent of London's total. Then follow Antwerp with 9,400,335 tons, or 55 per cent, and Rotterdam with a total of 7,657,907 tons, equivalent to 44.7 per cent of that of London.

In 1901 the total valuation was £39,643,618; in 1906 it was £43,486,437, an increase of £3,842,819 in the quinquennium. Between

Commerce

1901 and 1905 the average of the supplemental lists, which may be taken as the average annual value of new property, was £503,362. The increase of the revaluation of 1906 over the 1905 valuation was, however, £1,829,371, and the excess of this over the average annual value of new property may be taken as representing the increase in the general value of property in London, and as indicating to some extent the "unearned increment" of five years. It amounted to £1,326,000. Included in the quinquennial valuation of 1901 are the ratable values of the following special properties: Railways, £2,307,864; tramways (including, L. C. C.), £140,575; gas, £923,924; electricity, £202,729; water, £634,206; canals, £19,192; docks, £226,770; hydraulic, £30,018; telephones and telegraphs, £32,456. Total, £4,517,734.

The total gross value (used for king's taxes) is £52,928,707; but as there is no gross valuation put upon government property, the total gross value of London corresponding to the total ratable value cannot be given. On the basis of the known values, however, the gross rental value

of London may be put at £53,643,000, gross value being on an average 23 per cent higher than ratable value.

The supreme control of the London police force is vested in a chief commissioner (appointed by and acting under the control of the Home Office), who is assisted in his task by three assistant commissioners and five chief constables. The strength of the force Jan. 1, 1905, was 30 superintendents, 539 inspectors, 2,148 sergeants, and 14,129 constables, giving a total of 16,846; but of these nearly 2,000 were retained by the government for service at the dockyards, military stations, and other State establishments. The cost is over £1,750,000, and the revenue is derived from the proceeds of a 5d. rate and from a government grant equal to a 4d. rate.

LONDON, JACK: Socialist, novelist; born in San Francisco, Cal., 1876; educated in the University of California. To gain material for writing he became (1893) successively sailor, gold-miner, salmon-fisher, oyster pirate, fish-patrol, longshoreman, seal hunter in Bering Sea, and in 1900 began writing his very successful novels. But became interested in social subjects and eventually a Socialist. To get further experience he tramped over the United States and Canada, more than once getting into jail, and living also as a vagabond in East London. He went to the

Klondike in the gold rush of 1897, then as war correspondent to Japan and Manchuria. He was nominated Socialist candidate for the mayoralty of Oakland, Cal., and has done much lecturing for the Socialist Party. In 1906 he started on a seven years' cruise around the world, in a fifty-foot yacht. Among his novels are: "The Son of the Wolf" (1900); "The Call of the Wild," "The Sea Wolf" (1904); "The Game" (1905); "Before Adam" (1907). His main Socialist writing: "War of the Classes." Address: Glen Ellen, Sonoma County, Cal.

LONDON COUNTY COUNCIL, THE: The London County Council was established in 1889 by act of Parliament under the Local Government Act of 1888. (See LONDON.)

The Council consists of 19 aldermen, 118 councilors, and a chairman. Aldermen serve 6 years, and 9 or 10 must retire every 3 years, but may be reelected. The councilors are elected for 3 years. The councilors are elected directly by the rate-payers; and they elect the aldermen from their own members. The positions of aldermen and councilors vary only in regard to the term of office.

The powers and duties of the Council may be grouped under four heads: *First*, those formerly belonging to the Metropolitan Board of Works, e. g., raising and borrowing money, and loaning money to the councils of the metropolitan boroughs; drainage, and the sanctioning of local sewers; fire-brigade; parks and open spaces; construction of embankments; Thames crossings—bridges, tunnels, and ferries; street improvements—building lines, width of new streets, naming and numbering of streets; supervising buildings and district surveyors; dangerous structures; construction of theaters, music halls, artisans' dwellings; cattle diseases; testing of gas, gas-meters, and electric meters; protection of infants' life, etc. *Second*, powers transferred from former county judges affecting the granting of music and dancing licenses; provision of asylums for pauper lunatics, of reformatory and industrial schools; testing weights and measures; county buildings; coroners, and other minor matters. *Third*, powers transferred from various sources in regard to highways, licensing of theaters, slaughter-houses, cattle-yards; supervision of common lodging-houses, etc. *Fourth*, new powers in regard to the registration of voters, public health, historic buildings; inspection of factories and fire-escapes; suppression of nuisances; regulation of traffic; administration of the Shop Hours' and Shop Seats' Acts, of the Employment of Children Act, of the Midwives Act; reformatories for inebriates; registration of automobiles; the establishment of a steamboat service on the Thames, etc. Since the passing of the Education Act (London, 1903), the Council has become the authority for all public education in the county, both elementary and higher. As the central representative body of London, the Council is interested in numerous other affairs, and has delegates on all the important boards in London.

The Council elects numerous committees which report at the weekly meeting. The *Finance Committee* is the most important and has many statutory powers, since the Council is the principal money-raising body for all the different local boards in the county. It has a gross debt of £74,500,000. The annual expenditure amounts to £15,000,000, more than one third of which goes for education.

No costs, debt, or liability exceeding £50 may be incurred by the Council, except on a resolution passed on an estimate submitted by the Finance Committee. The *Asylums Committee* have special powers under the Lunacy Acts, and manage eight asylums. An experimental working colony for 300 male epileptics has been established on the Horton estate, and a new asylum for 2,000 patients is in course of erection. The different institutions provide for 17,000 patients. The *Housing of the Working Classes Committee* perform the duties conveyed to the Council by the Housing of the Working Classes acts, including the clearance of insanitary areas and the building of dwellings for working men. The Council has established a model municipal lodging-house for men at Parker Street, Drury Lane; and another for 800 men at Mill Lane, Deptford. In 1906 a third house of this class was opened. The Council has also built a large number of houses on estates in the suburbs, which are self-supporting. The *Bridges Committee* are concerned with the crossings and embankments of the Thames.

The most popular work of the Council is that connected with parks and open spaces.

The *Main Drainage Committee* have in charge the disposal of sewage. There are 290 miles of main, storm-relief, intercepting, and outfall sewers; nine pumping-stations and two sewage precipitation stations. The sewage of London is conveyed to Barking and Crossness, and there the solid matters held in suspension are precipitated, the harmless effluent being allowed to flow into the river. The Council obtained an act in 1900 for a comprehensive scheme of enlarging the main drainage system, and this was supplemented in 1904 by a scheme of extensive flood relief works. Work on these schemes is well under way. The total expenditure on main drainage up to March 31, 1905, was £9,633,000.

The Council has gradually bought up the different tramway systems of London, and is now in possession of all the tramways with the exception of a few miles, chiefly in the northwest—the system of the London Southern Company having been acquired in 1906. The Council leased one of the purchased lines to the North Metropolitan Tramways Company for a period of years expiring in 1910. But in 1906 the Council compensated the company for the surrender of the lease and took over the working of the line with a view to reconstructing all London tramways for the purpose of installing electric traction. The lines south of the river are furnished with an electric system, and 60 miles of double track are already equipped and working. The total mileage of tramways under the Council is 110; 50 miles north and 60 south of the river. The system is extended constantly. The total capital outlay on tramways up to March 31, 1906, was £4,724,477; the outstanding debt, £4,274,459; the yearly revenue is about £1,400,000.

The *Education Committee* is composed of 38 members of the Council and 5 coopted lady members. During 1904-5 the Council had a staff of about 20,000 teachers, 17,000 of whom were engaged in public elementary schools; there was an administrative staff of 500, and a corps of about 400 attendance officers. The average roll of public elementary schools was about 750,000. The estimates of expenditure for 1906-7 for education is £5,177,132, of which £4,322,798 is for elementary and £854,334 for higher educa-

tion. The latter includes now evening schools, pupil teachers' centers, secondary schools, polytechnics, and technical schools, and university teaching.

The charge falling on the rates, after deducting grants and other receipts in aid, is £3,441,990, or 1s. 7d. in the pound—an increase of 1d. in the pound over 1905-6.

The attempt of the Council to provide better facilities for traffic on the Thames by means of a good steamboat service has not been financially successful, and the boats have been laid off over the winter of 1906-7 until spring.

The Council obtained authority from Parliament in 1906 to build a new county hall.

The Council has two principal sources of revenue—the sale of stock and the county rate. The Imperial Exchequer makes contributions, chiefly for education. The current expenses, interest on debt, are paid out of the rates; disbursements in behalf of working-class dwellings and street improvements are generally recouped from receipts. Capital expenditures and current expenses of tramways are wholly covered by receipts. Permanent disbursements, e. g., purchase of tramways, are met by the sale of stock or bonds. During the year 1906 the Council issued no London County Council Consolidated stock, but provided for its capital expenses partly by stock issue of 1905, partly by London County bills. All borrowings of the Council are subject to the provision of a sinking-fund—under treasury approval—sufficient to repay all expenditure within sixty years. The total stock now outstanding amounts to £67,000,000. The rating for 1906-7 is 2s. 9½d. per pound over the whole county, including the city; and a further rate of 2½d. per pound over the county outside the city—owing to street improvements in the new parts. This includes 1s. 7d. for education.

The assessable value of the county on April 6, 1906, was £43,477,772; the estimated amount of a 3s. rate per pound for 1906-7 is £6,460,246.

The Council from its beginning until the last election has had a majority of Progressives, including such well-known Labor and Fabian leaders as John Burns, Sidney Webb, Graham Wallas, W. Crooks, W. C. Steadman, H. Gosling, and others.

THE RESULT OF ELECTIONS LONDON COUNTY COUNCIL

| | Councillors | | | Aldermen | | | Prog. majority |
|----------|-------------|------|-------|----------|-------|-------|----------------|
| | Prog. | Mod. | Ind. | Prog. | Mod. | Ind. | |
| 1889.... | 73 | 45 | | 18 | 1 | | 45 |
| 1892.... | 83 | 34 | 1 | 17 | 1 | | 65 |
| 1895.... | 58 | 59 | 1 | 12 | 5 | 1 | 6 |
| 1898.... | 69 | 48 | 1 | 12 | 7 | | 25 |

| 1907.... | 36 | 79 | 3 | | | | (1) |

¹ A majority of 40 councillors for the Moderates.

In 1907 the elections favored the Moderates, largely owing to desperate efforts on the part of private interests to defeat the Progressive program of municipalism and using the immediately increased expenditures as their weapon, while ignoring the prospective and partly realized income from the expenditures.

LORIA, ACHILLE: Professor of economy; born at Mantua, Italy, 1857. He held a pro-

fessorship first at Sienna, and since then has been at Padua. Cossa places him among the ablest of Italian economists, and says of his views: "In criticizing the established order of things economic he goes with the Socialists, lavishing upon them expressions of attachment with a profusion which is quite out of place, and yet he will none of their schemes and remedies, and abides steadfastly in the expectation that the course of nature will heal social wounds by a simple process which is already at work and consists in the 'diffusion' of property and the 'elision' of rent." Author: "La rendita fondiaria e la sua elisione naturale"; "La legge di popolazione ed il sistema sociale"; "Carlo Darwin e l'economia politica"; "Analisi della proprietà capitalista" (2 vols.).

LOS ANGELES FELLOWSHIP, THE: An association of people united together for the purpose of encouraging trustful and unselfish living. Other than this purpose, this young and virile organization authorizes no platform, program, or creed. The fellowship is the direct outgrowth of a series of addresses delivered in southern California by the Rev. B. F. Mills during the winter and spring of 1904. It is not a church in the technical sense, but yet in the best sense it means to be thoroughly religious and to endeavor to be what a church ought to be and do all that a living church should do for the community. The founder of the fellowship declares: "This society means to meet the demand of our time, a time when, as Mazzini says, 'The old world passes away but a new world comes into existence.'" It proposes to minister to every need of humanity, individually and collectively. The object of this organization is nothing less and it could be nothing greater than the attempt to put the true content into the idea of religion.

The officers of the society are not rulers but administrators.

The fellowship has adopted the two great modern principles of the initiative and referendum and of the recall or imperative mandate, by which methods the entire membership is enabled to partake in the government of the fellowship and in the administration of its affairs. The officers are Benjamin Fay Mills, Permanent Minister and President of the Council; Mary Russell Mills, Senior Associate Minister; Clarence Thompson, Assistant Minister, and a Board of Trustees. Clark R. Mahan, Associate Secretary. Offices, 434 South Hill Street, Los Angeles, Cal.

LOTTERIES. See **GAMBLING.**

. LOVEJOY, ELIJAH PARISH: Abolitionist; born at Albion, Me., 1802. Studying theology at Princeton, was ordained a Presbyterian minister in 1833, and became editor of the *St. Louis Observer*, a religious paper. While disclaiming any connection with the abolitionists, he nevertheless wrote sympathetically of the antislavery agitation, which was then beginning. This greatly offended many of the citizens, and the feeling against him increased in bitterness, until finally the office of the *Observer* was destroyed by a mob. He then resolved to remove his paper to Alton, Ill., but as soon as his press was brought there a mob broke it into fragments. The town reimbursed him for his loss, and another press was procured, only to be destroyed by the mob. He bought a third press, but it met the same fate.

By this time the question had become serious. A convention comprizing many of the noblest men in Illinois was held at Upper Alton. It supported him and bought another press, which arrived Nov. 7, 1837. At midnight a mob of thirty or forty men came from the neighboring drink-shops and commenced to throw stones at the warehouse, to fire shots, and at last attempted to burn it. The roof being set on fire, Mr. Lovejoy and several others stepped out and were fired upon by the rioters. One of the bullets struck Mr. Lovejoy, who only lived long enough to return to the warehouse.

LOVEJOY, OWEN R.: Secretary (1907) of the National Child Labor Committee; born 1866 at Jamestown, Mich. Graduated from Albion College, 1893. Minister in Methodist Episcopal Church in Michigan (1893-1900) and in Congregational Church, Mt. Vernon, N. Y. (1900-6). Assistant secretary of the National Child Labor Committee since 1905, mainly engaged in investigation of child-employing industries in the Northern states. He believes that society is to become politically and industrially democratic and free in the production and use of the ever-increasing store of wealth, through the development of higher ethical standards and systematic training for industrial efficiency.

LOVETT, WILLIAM: Chartist; born near Penzance, Eng., 1800. He was apprenticed to a ropemaker, then moved to London in 1821, where he found a precarious living in cabinet-making and by opening a confectionery store. Joining the First London cooperative association he became (1830) secretary of the British Association for Promoting Cooperative Knowledge, which, however, failed in three or four years. Becoming acquainted with Owen Coblett and others, he became active in various reforms—for the opening of museums on Sunday, against stamp-duties on papers, etc. In 1831 he refused to serve in the militia and execution was levied on his furniture, tho this led to Parliament's abolishing drawing. He was arrested in 1832 for taking part in a procession (rioting), but was soon acquitted. He joined the National Union of the Working Classes (1831) and the London Working Men's Association (1836). He drafted the bill afterward circulated as the "People's Charter." (See **CHARTISM.**) He was secretary of the first Chartist's Convention. He was imprisoned several times, once for twelve months. In 1844 he organized a society for political refugees, called Democratic Friends of All Nations. In 1848, with Hume and Cobden, he formed a People's League to try and unite the middle classes and the working men. For this he was much criticized by O'Connor and other Chartists, and after this he largely devoted himself to educational reform. He tried teaching and wrote extensively. He died in 1877. His main works are: "Chartism" (1841); school text-books, and an "Autobiography." (See **CHARTISM.**)

LUDLOW: One of the best model villages in America, near Springfield, Mass., where the Ludlow Manufacturing Associates (jute and hemp mills) offer over 500 attractive houses to their employees. No land can be bought, at any price, in the portion of the village owned by the company, and on which all the houses stand. The houses, tho built on streets somewhat scattered

and picturesquely placed, are built too closely together (tho they do allow of small gardens in front and behind), and tho with considerable variety in their own architecture, are in too stiff rows to be altogether pleasing. Nevertheless, the company does offer wonderfully convenient and attractive houses, at marvelously low rents for what is offered. Rents, across the river, outside the company's grounds, are almost twice as high for equal accommodations. Yet the company finds that it pays, and more than pays. Commencing in a small way, it is now steadily and rapidly putting up new streets of buildings. And the employees appreciate them. Wages in Ludlow are not high, yet the employees are more than content. An almost luxurious memorial clubhouse with appointments of parlors, billiards, gymnasium, swimming-baths, etc., offer both the men and young women unusual opportunities. A fair house, eight rooms and bath, rents for \$10.75 per month. Running water is furnished all the houses and baths, gas for cooking, steam-heat, and electric-heat can be had at only slight additional cost. Attractive apartments for girls only can be had at \$2.75 per week for a single room and full board. Boys and girls earn from \$4 to \$6 per week, and women (spinners) from \$6.50 to \$9. (See MODEL VILLAGES.)

LUDLOW, JOHN MALCOLM: English lawyer associated with Maurice and Kingsley in their Christian socialism, and to a degree the originator of the movement. A letter of his to Maurice, written from Paris in 1848, and describing the French Socialist movement of that period, seems first to have directly turned Maurice's thoughts in the direction of Christian socialism. Ludlow was associated with Maurice and Kingsley in the weekly paper, *Politics for the People*, and in 1850 he became editor of the *Christian Socialist*, which became in 1851 the *Journal of the Association*. He also wrote for the series "Tracts by Christian Socialists." Among those who started in 1850 the first association of cooperative working tailors Ludlow was prominent, and was one of the convening committee of the first cooperative congress in London, in 1860, together with Kingsley, Hughes, and Neale. After that date he took little prominent part in social reform save to write certain able articles on the early Christian Socialists in *The Economic Review* (Oct., 1893) and *The Atlantic Monthly* (Jan., 1896). Address: 35 Upper Addison Gardens, W. London, England.

LUTHER AND SOCIAL REFORM: A well-known modern writer has represented the German Reformation as mainly an economic revolt. Such a view is inadequate. At heart the movement was deeply religious, and even its theological aspects became, as the years passed, increasingly important. But this much is true—the beginning of the movement was a protest against an economic injustice, and this tangible economic side of the revolt was what brought to it the support of the people and the secular rulers. Luther became a force to be reckoned with by pope and emperor when he was seen to be striking at great social wrongs. When the popular religious life, the intellectual power of humanism, the new patriotism—the whole revolutionary upheaval of medieval life that marked the age—seemed in Luther to have found a voice, he became the central figure in Germany and the leader of a great national movement.

This gave popular force to the famous Theses. Ostensibly academic propositions from a scholar and for scholars, they were really words of earnest practical appeal and warning. That indulgences deceive and debase the people was their theme, and the monetary aspect of this wrong Luther keeps well to the fore.

"Christians should be taught," he says, "that he who gives to a poor man, or lends to a needy man, does better than if he bought pardons. Because by a work of charity, charity increases, and the man becomes better, while, by means of pardons, he does not become better, but only freer from punishment" (Thesis 43).

The wrong that he attacks is a gross form of the world-old substitution of churchism for true religion. The words which set Germany on fire were directed not against wrong theology, but against a church which had become a great financial system, enormously corrupt, but also enormously efficient in extorting the money of the people. Because the evil was grown intolerable and Luther's words rang true, men of every class rallied to his side. The princes with their increasing territorial power protected him from the common fate of heretics. The towns with their rapidly growing wealth and influence backed his program of reform. And the oppressed peasantry hailed him as their prophet.

In 1520 Luther, the acknowledged leader of radical Germany, presented in three treatises his full position. The address "To the Christian Nobility of the German Nation concerning the Reformation of the Christian Commonwealth" outlined in twenty-seven specific recommendations his positive program. Seven of these, a fourth of the whole, concern distinctly social questions. One urges the reform of popular education. Two discourage religious pilgrimages.

"Let the priest tell [the intending pilgrim] to spend his money, and the labor a pilgrimage would cost, on a thousandfold better work, namely, on his family and on his poor neighbors."

In the same spirit he denounced monasticism and the numberless saints' days. Granted their holy origin and the pope's approval, they must be abolished because in men's use of them they dishonor God. So he attacked begging, even when encouraged by religion, as an economic menace, and proposed that each town should feed its own poor and no others. To strip such questions of all pretense to sacredness and consider them merely in relation to the common good was a great advance step, as it was also a return to the attitude of Jesus. Many a genuine wrong fortified by the name of religion can be destroyed when we insist on regarding it only as economically and socially bad.

The last recommendation address to the secular affairs takes up what he regarded as the great social perils of his time. Were he to have used modern terms he would have named them extravagance and debt, the unrestrained power of the trusts, intemperance, and the social evil. Luther was afraid of the increasing tide of imports, particularly of expensive luxuries. He could not understand the use of credit, and so, in true medieval fashion, condemns it as an invention of the devil. But with all his foggy economics, the earnestness of his warning persuades us that he saw a real menace to society. And we, who live in a like time of rapidly increasing

wealth and rising values, may recognize it as money-madness, with its accompaniments of extravagance, speculation, debt, and greed. Related to this was the menace of the powerful commercial companies, like the Fuggers of Augsburg. In the then unsettled state of Germany, commerce ran many risks, but its profits were even greater. The questions we are still asking about this source of wealth were already in Luther's mind.

"Is it possible," he says, "that in a single man's lifetime such great wealth should be collected together, if all were done rightly and according to God's will? I am not skilled in accounts. But I do not understand how it is possible for 100 guilders to gain twenty in a year, or how one guilden can gain another, and that not out of the soil, or by cattle, seeing that possessions depend not on the wit of men, but on the blessing of God."

This was the May-time of the Reformation. Luther was writing on great questions of theology and the Church, but also on things that imperiled sobriety and industry among the people. In the social reforms he urged he was conservative, with no thought of a reorganization of the whole social structure, but he was not narrow. The whole scope of life, even down to its basis of economic justice, occupied his vision.

The Reformation marked a long step forward in the slow progress toward democracy. Only in democracy could its essential principles find complete expression. But, since a man seldom understands all the implications of his teaching, we may well ask Luther's attitude toward the democratic ideal. In "The Liberty of the Christian Man" (1520) he defends the thesis that the Christian man is free of all restraint, but is also under obligations to serve all. In particular, the priest is no different from any ordinary Christian, save in that he has a special task to perform. So of every class in society. One is not superior to another, but each has his own duty to perform for the whole body. And to Luther this was more than the beautiful dream that, through the centuries, has found so many noble expositions. In the "Address to the Nobility" he argued frankly that not the consecration of pope or bishop, but the consent of the people, gives authority to priest or bishop.

"For, since we are all priests alike, no man may put himself forward, or take upon himself, without our consent and election, to do that which we have all alike power to do." "We teach clearly, according to the Apostle, that every town should elect a pious, learned citizen from the congregation, and charge him with the office of minister."

And not only did he carry this into practise, but writing to the Bohemian churches in 1523 he further maintained the right of the congregations of a district to elect a bishop, and so build up a national church on a democratic basis.

Such radical views of the structure of the Church would readily spread to the secular power.

A treatise of 1523 on "The Temporal Authority" is in spirit thoroughly revolutionary. But this marked the high tide of Luther's iconoclastic teaching. The radical movement at

Wittenberg during his concealment at the Wartburg seems to have thoroughly frightened him. The Reformation movement had now acquired momentum. And Luther was no longer the free

lance of revolt, but a leader weighed down by the responsibility of power. In 1525 came the fearful events of the Peasants' War. In his "Exhortation to Peace," published at the height of the rising, Luther was inclined to favor their claims. Only a month later came another pamphlet, "Against the Murderous and Thievish Bands of Peasants," of which the best we can say is that it was written in the heat of violent passion.

"Crush them," he says of the peasants, "strangle them and pierce them, in secret places and in sight of men, he who can, even as one would strike dead a mad dog."

The wrongs of the peasants were undoubted. But in the play of great political forces, the Lutheran movement was in gravest danger. The rise of the peasants at just this time seemed to imperil the whole cause. So for the sake of the new Church he abandoned the cause of the people. At first the religious motive had led him directly to the social problems and wrongs in the life of his nation. But now the success of an institution usurped the chief place in his thought. His Church loomed larger to him than justice or the needs of men. Such a step once taken could not be retraced. As the years passed the Reformation from being a popular movement became a semipolitical issue of the princes. The place of the disowned authority of Rome was taken by the secular rulers. To-day there is no place for the democratic or representative element in the Lutheran churches of Germany. Naturally such a Church is not among the forces that work for democracy and freedom.

HARRIE R. CHAMBERLIN.

LUXURY, says Prof. Émile de Laveleye, "consists in the consumption of what has cost great labor to produce, for the satisfaction of spurious needs." So defining it, he condemns it, and says: "Luxury is pernicious to the individual and fatal to society. Primitive Christianity reformed it in the name of charity and humility; political economy condemns it in the name of utility, and justice condemns it in the name of equity."

Prof. R. T. Ely writes in the *Kingdom* (June 5, 1896):

A newspaper writer, speaking of certain extravagant social events which occurred a few years since, used these words: "Murmurs against luxury may be heard among people in straitened circumstances when the lavish expenditures and sumptuous pleasures of great society entertainments are discussed. But such persons are prone to forget that these expenditures that seem so prodigal go in large part to benefit the working people." We cannot consider now all the economic fallacies involved in arguments of this kind. They have been exposed over and over again by able men. It may, however, simply be pointed out that the same expenditure made in behalf of others would give equal employment to labor. Let us take the case of a man who contributes \$1,000,000 for a public building, and contrast it with the case of a man who spends \$1,000,000 on his own private house. Labor has equal employment in both cases, but the benefit of the toil accrues to the public in the one case and in the other to the selfish enjoyment of an individual. Another comparison: Contrast the expenditure of \$10,000 for an evening's entertainment with an expenditure of \$10,000 for books for a public library. Labor is alike employed in both cases, but in the second case the enjoyment is more widely diffused and is of a far more enduring character. This attempted justification is precisely on a line with that which people advance for the maintenance of gambling-dens and the support of the traffic in intoxicating beverages.

Yet tho this view is supported by all moralists and all economists, the development of luxuries and extravagance goes on in all modern cities and perhaps most of all in New York City and among

Reactionary
Views

Americans of the wealthiest class. Mr. Cleveland Moffett, writing in *Success* in 1906 on "The Shameful Misuse of Wealth," gives many instances. We read of \$1,000 a year spent on clothes for a poodle; dog collars set with pearls or diamonds; dogs themselves worth \$3,000-\$5,000 (St. Bernards, \$7,000); ordinary families among the wealthy with 24 servants; chefs with salaries of \$5,000 to \$10,000. We read of dinners of every extravagance, dinners served on golden dishes, appendicitis dinners, horseback dinners on luxuriously trapped horses, monkey dinners, bull and bear dinners, dinners with opera singers as centerpieces, clown dinners, singing-bird dinners, and even a dinner given by a New Yorker where the table represented an Egyptian desert and the guests dug up jewels with gold shovels and picks. The jewelry worn by the wealthy in New York has been estimated at \$200,000,000. Pearl necklaces for women cost \$200,000 or more; twenty men in New York are said to wear link cuff buttons costing \$5,000. The estimate is made for New York that for dress 100 women spend each \$30,000 annually, or \$3,000,000; 1,000 women spend each \$15,000 annually, or \$15,000,000; 5,000 women spend each \$5,000 annually, or \$25,000,000; 6,100 women spend each \$50,000 annually, or an annual total of \$43,000,000.

Yachts for the wealthy cost from \$500,000-\$750,000 and cost fortunes annually to maintain. W. K. Vanderbilt's private car is valued at \$50,000. Single individuals have 17 automobiles. On cottages at Newport \$100,000 are spent for a stone wall or \$100 for a tree. To prevent ennui the men gamble for \$10,000 in an evening; women for smaller amounts. Ladies have strange pets—snakes, pigs, lions, and bears. Their poodles have gold-filled teeth, are sent in victorias for fresh air, accompanied by liveried servants, or taken to the opera. And so through all the nauseating round.

In Europe it is much the same, tho perhaps with less tawdry display of wealth. In England and Wales people spend annually in licenses alone: For carriages, £513,261; armorial bearings, £68,479; male servants, £148,690; killing game, £581,232.

LUZZATTI, LUIGI: Italian statesman; born 1841, of Jewish parents, in Venice. He studied law and political sciences, and taught for a short time at the Instituto Tecnico in Milan, and later accepted a professorship of political economy and constitutional law at the University of Padua (1867). Elected to the House of Deputies in 1871, he soon became prominent in matters of finance, and was appointed Minister of the Treasury in Rudini's cabinet of 1891-92 and 1896-98. His principal activity in philanthropy consists in the establishment of numerous savings-banks and mutual relief associations.

LYNCING (for statistics, see **HOMICIDES**): The following article, by Cardinal Gibbons, is condensed by his permission from *The North American Review* for Oct., 1905:

It is a law of all Christian and civilized nations, based on the Mosaic ordinance, that all deliberate murderers and other atrocious criminals shall expiate their transgressions by the death penalty.

But private individuals, how exalted soever may be their station and influence in the community, or how grievous soever the offense, cannot constitute themselves the agents for punishing the

guilty. A claim of this kind would destroy or imperil security of life, and lead to indiscriminate bloodshed.

The prerogative of exacting life for life, and blood for blood, is vested exclusively in the public authorities, who are charged with maintaining the peace and good order of the commonwealth.

But even civil rulers are forbidden to make an arbitrary use of their prerogatives, at least in times of peace. Their powers are strictly defined. They can pronounce sentence of death only after a judicial verdict has been rendered. The Constitution of the United States expressly provides that no man may be condemned to death till declared guilty after a judicial trial.

I admit that there are exceptional times and circumstances when summary executions may be tolerated and condoned; when, for instance, a territory is suddenly occupied by a mixed and heterogeneous population, and is in a formative state; when the civil law and the usual machinery and appliances of a stable government are not yet established. On occasions like this, the recognized leaders of the people may punish notorious criminals in the interests of social order. But it is manifest that this method of chastising offenders cannot be tolerated in a state where the courts of justice are in free operation.

What aggravates the crime of lynch law is the circumstance that not unfrequently it sentences to death an innocent person, while the guilty party escapes. Cases of mistaken identity and ungrounded suspicion are liable to occur when we consider the excited frame of mind of the unhappy victim of violence and lust, and the eagerness of an outraged community to avenge an atrocious and brutal crime.

Unfortunately, also, the lynching of one individual is sometimes attended by the accidental and promiscuous slaying or wounding of bystanders in the conflict.

Another deplorable result of lynching is that public sympathy is sometimes drawn from the innocent victim of lust and murder, and is transferred for the time being to the brute who outraged and killed her. Her defenseless condition, her agonies and cries for help, her vain entreaties, her dishonor worse than death, culminating often in torture and murder in order to cover the crime—all this horrible picture fades from view and is almost forgotten, while the iniquity of the human fiend is condoned or palliated on account of the lawless manner in which his crime was expiated. He often becomes the hero of the hour, and is regarded by some even as a martyr. And, while the malefactor's crime is almost lost sight of, and he becomes the object of morbid pity, popular denunciation falls on the heads of those who participated in his summary execution.

If, indeed, the illegal and violent infliction of the death penalty on criminals had a deterrent effect on other evil-disposed persons, and acted as a warning to them, that circumstance, while not justifying lynch law, might at least offer some excuse or palliation for its exercise. But experience shows that it rather increases instead of diminishing the calendar of crime. Far from terrorizing the colored race who are the usual sufferers from hasty executions, it inflames them with indignation, and excites them to perpetrate deeds of violence on the weaker sex as much from a spirit of revenge, and from a triumph in the humiliation of their victims, as from a desire to gratify their animal passions.

Let us now examine into the principal grounds of excuse for the exercise of lynch law. One of the causes of hasty and violent executions without the forms of law is the needless and often irritating delay in bringing a notorious criminal to the bar of justice, and the infliction of punishment inadequate to the enormity of the offense.

Yet another crying evil and incentive to lynching is the wide interval that so often interposes between a criminal's conviction and the execution of the sentence, and the defeat of justice by needless procrastination. Human life is indeed precious and sacred, but the effort to guard it has gone beyond reasonable bounds. It is blessed to be merciful, but mercy should not be exercised at the expense of justice and social order. Misplaced clemency often works infinite harm to the community.

Of late years the difficulty of carrying out the judgment of the court (in murder trials especially) has greatly increased from the widened application of pleas in bar—notably that of insanity. When a conviction has been reached, innumerable obstacles generally stay the execution. The many grounds of exception allowed to counsel, the appeals from one court to another of higher jurisdiction, involving an enormous expense to the commonwealth, the long periods of time intervening between the terms of the lower and higher courts, the impossibility of recalling the original witnesses by reason of their death or removal to distant parts of the country, the apathy or fading interest of the friends of the prosecution, the untiring efforts of the advocates and friends of the accused, the facility with which signatures for pardon are obtained, with the final application for mercy to the governor—all these circumstances have combined to throw around the transgressor an extravagant protective sys-

tem, and have gone far to rob jury trials of their substance and efficacy.

When the crime of the accused has been manifestly proved, and no extenuating circumstances can be advanced, the lawyers for the defense have often recourse to the plea of insanity as a last resource. Medical experts are always available to testify to the moral irresponsibility of the culprit, bewildering the jury by their technical phrases. This subterfuge not unfrequently succeeds in defeating the ends of justice, tho the sanity of the guilty party had never before been called in question.

A sovereign remedy for the suppression of lynching and for the restoration of the law's supremacy is found in a speedy trial and conviction of the accused, if he is found guilty, followed by the rigorous execution of the sentence.

It would be a great blessing for society if our lawmakers were to revise the criminal code now in force, and to sweep away, or at least considerably diminish, the barriers which interpose between the crime and its punishment. A prompt execution of the verdict would strike terror into evil-doers, and satisfy the public conscience.

But it is far more merciful to stop crime than to punish it by legislation. It is better to remove the cause than to repair its evil effects. From data before me, I infer that about 70 per cent of those who perished by lynching in the Southern states between 1885 and 1903 belonged to the colored population. If the deep-rooted antipathy between the white and the black races were removed, or assuaged, these violent executions would be considerably diminished.

This blessed result can be accomplished only by submission to the teachings of the Gospel, which proclaims the equality of all men before God.

J. CARD. GIBBONS.

M

MABLY, GABRIEL BONNOT DE: Political economist; born in Grenoble, 1709. Pursued his studies with the Jesuits of Lyons; entered the Seminary of St. Sulpice, but later became secretary to his relative, the Cardinal of Teucin, Minister of Foreign Affairs. The true minister was Mably. However, a misunderstanding arose between the minister and his secretary, and Mably withdrew to devote himself to political science. Already in 1742 his "*Parallèle des Romains et des Français par rapport au gouvernement*" had established his fame. In 1748 appeared the "*Droit public de l'Europe fondé sur les traités*"; afterward the "*Entretiens de Phocion sur le rapport de la morale avec la politique*" (1763); "*Doutes proposés aux philosophes économistes sur l'ordre naturel des sociétés*" (1768); "*De la législation, ou Principes des lois*" (1770); "*Observations sur le gouvernement et les lois des États-Unis d'Amérique*" (1784)—a curious work, in which he predicts the approaching downfall of the new republic "unless it turn away from the line of commercialism in which it is involved." Invited by the Polish Diet to prepare a code of laws for Poland, his "*Gouvernement de Pologne*" appeared in 1781.

Mably died in 1785, author also of several posthumous works, among them "*Les Droits et les Devoirs du Citoyen*."

The economic ideas of Mably are scattered through all his works; they form a complete system and make him one of the first thinkers of his age.

MACARTHUR, MARY R. (MISS): Secretary Women's Trade-Union League; born at Glasgow, Scotland, 1880. Joined National Union of Shop Assistants and Clerks in 1900; was elected first president of Ayr Branch, and afterward became its secretary. Elected first president of Scottish National Council of Shop Assistants' Union; was also elected first woman member of the National Executive of the Union. In 1903 Miss Macarthur was appointed secretary of the Women's Trade-Union League; has attended Scottish Trade-Union Congress and British Trade-Union Congress annually since 1903. She represented the Women's Trade-Union League at the Women's International Congress at Berlin in 1904. Miss Macarthur is at present the only woman member of the Executive of the London Trades' Council; she has been very successful as an organizer of women's trade-unions; during the past few years has been instrumental in adding many thousands to the ranks of the British women trade-unionists. In politics she is a Socialist and a member of the Independent Labor Party. Author of many articles and papers published in *The Labor Record*

and other newspapers and periodicals. *Address:* Women's Trade-Union League, Club Union Buildings, Clerkenwell Road, London, E. C.

McBRIDE, JOHN: American labor leader; born in Wayne County, Ohio, in 1854; commenced working in the mines at the age of nine. In 1870 he joined the Miners' Union; in 1883 was elected its president. In 1881 was nominated to the state legislature, and tho defeated, was renominated and elected in 1883 and again in 1885. In 1886 was Democratic candidate for Secretary of State. In 1894 was elected president of the American Federation of Labor (*q. v.*), but defeated in 1895.

McCULLOCH, JOHN RAMSAY: Editor; author; born at Whithorn, Scotland, 1789; became editor of *The Scotsman*, a Liberal organ, and one of the editors of *The Edinburgh Review*. He wrote the article on political economy in the supplement to the "Encyclopædia Britannica" (1824), and expanded it in 1825 into the "Principles of Political Economy, with a Sketch of the Rise and Progress of the Science." In 1828-32 he was professor of that science in the University of London. In 1838 was controller of the royal stationary office, and received a pension of £200. One of the first to develop free-trade views. His "Dictionary, Practical, Theoretical and Historical, of Commerce and Commercial Navigation" and a "Dictionary, Geographical, Statistical, Historical, of the Various Countries, Places, and Principal Natural Objects of the World" were long standard authorities. Died at Westminster in 1864.

MacDONALD, ALEXANDER: Miner; Commissioner on Labor Laws; born 1821 in Lanarkshire, the son of a miner; worked in the pit at the age of eight years. Having an ardent desire for education, prepared himself for Glasgow University; entered in 1846, working as a miner in the summer; became a leader of the miners all over Scotland. In 1850 became a school-teacher; in 1857 gave this up to give all his time to agitation on behalf of the miners. In 1863, on the formation of the National Union of Miners, was elected president. Meanwhile, by some commercial speculations acquired a modest fortune, which enabled him to devote all his time to advocating a parliamentary program among the miners. In the general election for 1874 was returned to Parliament for Stafford with Mr. Bright (*q. v.*), the first Labor member. He was appointed on the Royal Commission on Labor Laws, and brought in a minority report. Died in 1881.

MACDONALD, JAMES RAMSAY: English Socialist and Labor M.P.; born Lossiemouth, 1866, his parents being agricultural laborers. Worked as a clerk in London, but also studied and taught. In 1888 he became secretary to Mr. T. Lough, M.P. A contributor to the reform press, he was one of the pioneers of socialism in the south of England, joined the Independent Labor Party, and was chosen on its administrative council, and on the executive of the Fabian Society. In 1900, on the formation of the Labor Representation Committee, he was elected its first secretary, and so continued, till last year it became the Labor Party, with Mr. Macdonald as its secretary and Parliamentary whip. He has also served the London County Council, 1901-4. Strongly op-

posed to the Boer War, in 1903 he went to South Africa, and wrote "What I Saw in South Africa." He has been editor of the *Socialist Library*, and writer of numerous articles on Socialist and Labor topics. In 1906 he was elected to Parliament for Leicester. *Address:* 3, Lincoln's Inn Field, London, W. C.

McGLYNN, EDWARD: Priest; born New York City, 1837; was educated at the College of the Propaganda in Rome. Entering the Roman Catholic priesthood, became in 1866 pastor of St. Stephen's Church, in New York City, where he rapidly gained influence and popularity. His opposition to the establishment of parochial schools and his advocacy of the land doctrines of Henry George (*q. v.*) brought him into disfavor with the Church, and he was summoned to Rome, and, on refusing to go, excommunicated. In 1887 he aided in founding the Anti-Poverty Society (*q. v.*) and became its president, lecturing on its principles before enthusiastic audiences in New York City and elsewhere. In 1893 he was reconciled to the Church, tho without renouncing his economic views; the ban of excommunication was removed, and he was restored to his rank and to office in the Church. Died in 1899.

McGUIRE, PETER J.: First vice-president of the American Federation of Labor; born New York City, 1852; was educated in public schools and evening classes at the Cooper Institute; in 1867 apprenticed as a wood joiner; joined the union of his craft in 1872, and interested himself in the labor movement. In 1880 secured the passage of labor bills in Missouri and organized the labor bureau of that state; became a Greenbacker in 1876 and stumped Missouri in 1880. In 1881 organized the Brotherhood of Carpenters and Joiners (*q. v.*); was arrested that year for conspiracy, but acquitted. In 1881 was delegate to the International Working Men's Congress in Switzerland, and studied industrial conditions in Europe. In 1882 he became general secretary of the Brotherhood of Carpenters; has address many thousand meetings in all portions of the United States; was for years vice-president of the American Federation of Labor.

McKENZIE, HON. JOHN: Minister of Lands in New Zealand; born in Rosshire, Scotland, 1838; went to New Zealand in 1866 and became a prosperous farmer. For over thirty years he has held important political positions, as member of Parliament and later Minister of Lands. In this position he mainly has carried out New Zealand's new policy of "land for the people."

McMAHON, JOHN R.: Author and journalist; born 1875 at Roy Bareilly, India, of missionary parents. Entered New York journalism 1893; private in 202d Regiment, New York Volunteers, in Spanish-American War, 1898. Resumed journalism in work on newspapers, magazine stories, dramatic collaboration. He is author of "Toilers and Idlers," a socialistic novel (1907), and in politics is a supporter of socialism.

McNEILL, GEORGE E.: Sometimes called "The Father of the American Federation of Labor"; born in Amesbury, Mass., 1836, his father one of the early workers in the antislavery movement, a friend of John G. Whittier. He

worked as a boy in the woolen mills of his native town, organized a union among the boys, took part in a strike, and was blacklisted. In 1856 he went to Boston and earned a precarious living in many occupations. He joined the Sons of Temperance and wrote for temperance papers. Becoming convinced, however, that intemperance was largely the result and not the cause of poverty, he gave his life to the Labor movement. He first became prominent as a writer and worker for *The Daily Voice*, a Boston Labor paper, and spoke for this all over New England. Coming to believe with Ira Steward (*q. v.*) in the Eight-Hour Philosophy (*q. v.*) as the main philosophy of labor, he became its main spokesman and imbued the whole American Labor movement with its views. He was an active member of the great Eight-Hour League, and had much to do with the establishment of the ten-hour law of Massachusetts; he founded the Working Men's Institute, and in co-operation with Wendell Phillips, Governor Claflin, and others, led to the establishment of the Massachusetts Bureau of Statistics of Labor, the first labor bureau. Upon its organization in 1869, he was made deputy chief, but displaced for political reasons in 1873, the bureau having shown that the Massachusetts savings-banks received their capital largely not from working men but from capitalists. (See LABOR BUREAUS.) He was president of the famous Boston Eight-Hour League for eight years. (See EIGHT-HOUR DAY.)

He joined the Sovereigns of Industry, and became state secretary. Upon the formation of the International Labor Union of America was made president; in that capacity address public meetings all over the United States. He was connected as editor or associate editor with the *New York Labor Standard*, *Fall River Labor Standard*, Paterson (N. J.) *Labor Standard*, Paterson *Home Journal*, as well as *The Voice*. He founded the *Labor Leader* at Boston. He was an active member of the Labor Congress at Rochester in 1874, and there wrote a declaration of principles later adopted by the Knights of Labor (*q. v.*).

He served for a time as a member of the school committee of the city of Cambridge, Mass. He joined the Knights of Labor in 1883; became prominent in District 30 of that order, when District 30 was the largest district of the largest labor organization that had existed up to that time, and was appointed district treasurer in 1884. He favored, however, the principle of trade autonomy for each trade, and on that issue, differing from Mr. Powderly (*q. v.*), he largely led in the movement which resulted in the formation of the American Federation of Labor (*q. v.*), and became one of its foremost councilors, the intimate friend and adviser of Mr. Gompers (*q. v.*). He was successful as arbitrator of differences between employers and employees; notably in the great horse-car strike in Boston, 1885, and in the case of the employees of the Union Pacific Railroad. In 1886 he was the working men's candidate for Mayor of Boston. The first systematic history of the Labor movement in America was undertaken by McNeill, resulting in the publication of "The Labor Movement, or the Problem of To-day," in 1886, edited and the larger portion written by himself. He was appointed by the Governor of Massachusetts a Commissioner of Manual Training (1892); later on taxation, and on codification of laws. Mr. McNeill was an independent and radical Democrat, his economic

ideals being those of trade-union socialism. He was an ardent Anti-Imperialist, and a constant speaker and writer in protest against every kind of oppression. In 1883 he founded the Massachusetts Mutual Accident Association, and, after years of struggle, found in this pecuniary success. He wrote some verse—"Unfrequented Paths." He was in religion a Christian Socialist (and warden of the Church of the Carpenter). (See BLISS, W. D. P.) He died in 1906.

MACHIAVELLI, NICCOLÒ DI BERNARDO:

Writer and diplomat; born Florence, 1469, of middle-class parentage. A man of affairs rather than a student, he grew up in the brilliant court of Lorenzo the Magnificent, and after the reestablishment of the republic in 1498 he was, till the return of the Medici in 1512, chancellor or secretary of the second chancery in Florence, thrown intimately with public men, and sent on repeated embassies to Cesare Borgia, Pope Julius II., the Emperor Maximilian, Louis XII. of France, and the various Italian states. The return of the Medici ended his public career, tho he sought favor with them, and in 1521 was commissioned by them to write a history of Florence; but in 1527 the Medici were again driven from Florence, and Machiavelli died in disappointment the same year.

His political writings have made his reputation. "Dell'arte della guerra" (1520) advocates the present system of standing armies instead of the Middle Age use of mercenaries. His "Lettere familiari" and "Istorie Fiorentine" (1525) give unrivaled insight into his times. His "Discorsi sopra la prima deca di Tito Livio" gives his ideas of republican government; but his great work is "Il Principe," in which he considers absolute monarchy, and has made the word *machiavellism* a synonym for evil. There has been interminable discussion whether Machiavelli wrote this book satirically, cynically, immorally, or honestly. It is a remorseless and scientific examination of the principles and methods an absolute monarch as a matter of fact follows and seemingly must follow in order to succeed. All factors of rights and morals are eliminated. Every point is proved and illustrated from contemporary history. Some of his principles need a Cesare Borgia to execute. Like the "Discorsi," it was published after his death in 1532. (See POLITICAL SCIENCE.) Machiavelli was undoubtedly a man of the world, but he always seems to have been true to Florence, and to have had a true, devoted wife in Marietta Corsini.

MACHINERY: The importance of machinery in production can scarcely be overestimated. The part that it has played in the development of the modern labor problem can scarcely be put too strongly. We shall consider: I. The Facts of Machine Production; II. Social Results; III. The Right Use of Machinery.

I. THE FACTS OF MACHINE PRODUCTION.

Tools and machinery are not identical; a tool is an instrument, usually simple, tho, as in the case of the lathe and potter's wheel, sometimes complex, which is guided and directed by the skill of the craftsman. When the tool grows complex, and is not guided by the individual skill of the craftsman, but by a mechanism which governs its action, it is called a machine. Ma-

chinery usually includes motor mechanism transmitting mechanism, and working or tool mechanism.

Machinery increases man's productivity in two ways. It enables him, as with the steam-hammer, to concentrate enormous power upon a fixed point, and to make motion regular and continuous. Says Mr. J. A. Hobson ("The Evolution of Modern Capitalism," pp. 51, 52):

Machinery can increase the scope of man's productive ability in two ways: The difficulty of concentrating a large mass of human force upon a given point at the same time provides certain quantitative limits to the productive efficiency of the human body. The steam-hammer can perform certain work which is quantitatively outside the limit of the physical power of any number of men working with simple tools and drawing their motor power from their own bodies. The other limit to the productive power of man arises from the imperfect continuity of human effort and the imperfect command of its direction. . . .

Use

Machinery can also do work which is too fine or delicate for human fingers, or which would require abnormal skill if executed by hand. . . .

The continuity and regularity of machine-work are also reflected in certain economies of measurement. The faculty of self-registering, which belongs potentially to all machinery, and which is more utilized every day, performs several services which may be summed up by saying that they enable us to know exactly what is going on. When to self-registration is applied the faculty of self-regulation, within certain limits a new economy of force and knowledge is added. But machinery can also register and regulate the expenditure of human power. Babbage well says: "One of the most singular advantages we derive from machinery is in the check which it affords against the inattention, the idleness or the knavery of human agents."

These are the sources of all the improvements of economies imputed to machine production. All improvements in machinery, as applied to industrial arts, take therefore one of the following forms:

(1) Rearrangement or improvement of machinery so as to utilize more fully the productive power of nature or man. Improvements enabling one man to tend more spindles, or enabling the same engine at the same boiler pressure to turn more wheels, belong to this order of improvement.

(2) Economies in the source of power. These will fall under four heads: 1. Substitution of cheaper for dearer kinds of human power. Displacement of men's labor by women's or children's. 2. Substitution of mechanical power for human power. Most great improvements in the "labor-saving" character of machinery properly come under this head. 3. Economies in fuel or in steam. The most momentous illustration is the adoption of the hot blast and the substitution of raw coal for coke in the iron trade. 4. The substitution of a new mechanical motor for an old one derived from the same or from different stores of energy—e. g., steam for water-power, natural gas for steam.

(3) Extended application of machinery. New industrial arts owing their origin to scientific inventions and their practice to machinery arise for utilizing waste products. Under "waste products" we may include (a) natural materials, the services of which were not recognized or could not be utilized without machinery—e. g., nitrates and other "waste" products of the soil; (b) the refuse of manufacturing processes which figured as "waste" until some unsuspected use was found for it.

The development of machinery may be divided into four periods:

1. The period of the earlier mechanical inventions, marking the displacement of domestic by factory industry (1764-85).

2. The period of application of steam to manufacturing (1785-1814).

3. The period of steam locomotion, with its bearing on industry (1814-56).

4. The period of the construction of machinery by machinery (1856-66).

Important dates in the development of machinery are the invention of Hargreave's spinning-jenny (1764), Arkwright's mill (1771), Crompton's mule (1779), Cartwright's power-loom and Watt's engine for cotton-mills (1785), Whitney's cotton-gin (1792), Stephenson's locomotive (1814), the opening of the first railway (1822), the hot blast (1829), ring-spinning (1841). The revolution in the industrial world created by

machinery has been often dwelt upon. The following facts are taken from the first report of the United States Commissioner of Labor for 1886:

In the timber business twelve laborers with a Buckner machine will dress 12,000 staves. The same number of men by hand labor would have dressed in the same time only 2,500. In the manufacture of paper a machine now used for drying and cutting, run by four men and six girls, will do the work formerly done by 100 persons, and do it much better. In the manufacture of wall-paper the best evidence puts the displacement in the proportion of 100 to 1. In a phosphate mine in South Carolina ten men accomplish with machinery what 100 men handle without it in the same time. There has been a displacement of 50 per cent in the manufacture of rubber boots and shoes. In South Carolina pottery the product is ten times greater by machine processes than by muscular labor. In the manufacture of saws, experienced men consider that there has been a displacement of three men out of five. In the weaving of silk the displacement has been 95 per cent, and in the winding of silk 90 per cent. A large soap manufacturing concern carefully estimates the displacement of labor in its works at 50 per cent. In making wine in California a crushing machine has been introduced with which one man can crush and stem 80 tons of grapes in a day, representing an amount of work formerly requiring eight men. In woolen goods modern machinery has reduced muscular labor 33 per cent in the carding department, 50 per cent in the spinning, and 25 per cent in the weaving. In some kinds of spinning 100 to 1 represents the displacement. In the whole United States in 1886 the machinery was equal to 3,500,000 horse-power. If men only had been employed, it would have required 21,000,000 to turn out the actual total product; the real number was 4,000,000. To do the work accomplished in 1886 in the U. S. by power machinery and on the railways would have required men representing a population of 172,500,000. The actual population of the U. S. in 1886 was something under 60,000,000, or a little more than one third.

Commenting on these very remarkable statistics, the Labor Commissioner says: "The apparent evils resulting from the introduction of machinery and the consequent subdivision of labor have to a large extent, of course, been offset by advantages gained; but it must stand as a positive statement, which cannot be successfully controverted, that this wonderful introduction and extension of power machinery is one of the prime causes, if not the prime cause, of the novel industrial condition in which the manufacturing nations find themselves."

Machinery, too, has revolutionized agriculture. Mr. D. A. Wells considers it to have made greater changes here than in any other occupation. He says ("Recent Economic Changes"):

In respect to no other one article has change in the conditions of production and distribution been productive of such momentous consequences as in the case of wheat. On the great wheat-fields of the State of Dakota, where machinery is applied to agriculture to such an extent that the requirement for manual labor has been reduced to a minimum, the annual product of one man's labor, working to the best advantage, is understood to be now equivalent to the production of 5,500 bushels of wheat. In the great mills of Minnesota, the labor of another one man for a year, under similar conditions as regards machinery, is in like manner equivalent to the conversion of this unit of 5,500 bushels of wheat into 1,000 barrels of flour, leaving 500 bushels for seed purposes; and altho the conditions for

analysis of the next step in the way of results are more difficult, it is reasonably certain that the year's labor of one and a half men more—or, at the most, two men—employed in railroad transportation, is equivalent to putting this 1,000 barrels of flour on a dock in New York ready for exportation, where the addition of a fraction of a cent a pound to the price will further transport and deliver it at almost any port of Europe.

Here, then, we have the labor of three men for one year, working with machinery, resulting in the producing all the flour that 1,000 other men ordinarily eat in a year, allowing one barrel of flour for the average consumption of each adult. Before such a result the question of wages paid in the different branches of flour production and transportation becomes an insignificant factor in determining a market; and, accordingly, American flour grown in Dakota and ground in Minneapolis, from 1,000 to 1,500 miles from the nearest seaboard, and under the auspices of men paid from \$1.50 to \$2.50 per day for their labor, is sold in European markets at rates which are determinative of the prices which Russian peasants, Egyptian "fellahs," and Indian "ryots" can obtain in the same markets for similar grain. (See AGRICULTURE.)

Mr. Hobson says (as above):

It must not be forgotten that by far the most important factor in the decline of English agricultural employment is the

transport machinery which has brought the produce of distant countries into direct competition with English agricultural produce.

Of England, Mr. William Clarke, in the "Fibian Essays," says:

A cotton-mill in one of the dismal "hell-holes" called towns in Lancashire is a wonderful place, full of bewildering machines. Here is a machine called an "opener," by which 15,000 pounds of cotton can be opened in fifty-six hours. There is a throstle, the spindles of which make from 6,000 to 7,000 revolutions per minute. Here is a man who, with the aid of two pieces to take up and join the broken ends, can work 2,000 spindles. Among the distinct separate machines used are opener, scutcher, and lap machine, drawing frame, slubbing frame, intermediate frame, roving frame, throstle, self-acting mule and hand mule, doubling frame, and mule doublers or twiners. By means of these appliances the following results have been attained: Within eight years, from 1792 to 1800, the quantity of cotton exported from the U. S. to Lancashire had increased from 138,000 pounds to 18,000,000 pounds. In 1801 Lancashire took 84,000 bales of cotton from the U. S.; in 1876 she took 2,075,000 bales; and whereas in the former year only 14,000 bales came from India, in 1876 from that country came 775,000 bales, besides a great increase in Brazilian cotton, and a new import of 332,000 bales from Egypt.

England

In 1805 1,000,000 pieces of calico were sold in the Blackburn market during the whole year; and that was considered a very large sale. In 1884, according to Ellison's "Annual Review of the Cotton Trade," there were exported 4,427,000 yards of piece goods, besides the vast quantity produced for home consumption. In 1875, in place of the little cottages with their hand-loom of a century before, Lancashire contained 2,655 cotton factories with 37,515,772 spinning-spindles and 403,118 power-looms; and she produced yarn and piece goods to the weight of 1,088,800,000 pounds, and of the value of £95,447,000. See, too, how through the use of machinery the cost of production has been lowered. In 1790 the price of spinning the yarn known technically as No. 100 was 45. per pound; in 1826 it had been reduced to 64d. The sale price of yarn No. 100 in 1786 was 38s.; in 1793 it was reduced to 15s. 1d.; in 1803 to 8s. 4d.; in 1876 to 25. 6d. The decreased cost in each case followed on economy in production, itself dependent on increased differentiation in machinery; that in turn involving larger and larger capital; and that again necessitating aggregation and the crushing out of small concerns which could not command machinery or sell at a profit in competition with it.

And this process is by no means an ended one. Mr. Carroll D. Wright, in his "Industrial Evolution of the U. S.," chap. xxvii., gives some instances of recent improvements in machinery:

One of the latest sextuple stereotype perfecting presses manufactured by R. Hoe & Co., of New York, has an aggregate running capacity of 72,000 eight-page papers per hour; that is to say, one of these perfected presses, run by one pressman and four skilled laborers, will print, cut at the top, fold, paste, and count (with supplement inserted if desired) 72,000 eight-page papers in one hour. To do the presswork alone for this number of papers would take, on the old plan, a man and a boy, working ten hours per day, 100 days. By the use of Goodyear's sewing-machine for turned shoes one man will sew 250 pairs in one day. It would require eight men, working by hand, to sew the same number in the same time. By the use of a heel-shaver or trimmer one man will trim 300 pairs of shoes a day, while formerly three men would have been required to do the same work; and with the McKay machine one operator will handle 300 pairs of shoes in one day, while without the machine he could handle but five pairs in the same time. So, in nailing on heels, one man, with the aid of machinery, can heel 300 pairs of shoes per day. In the days of the single-spindle hand-wheel, one spinner, working fifty-six hours continuously, could spin five hanks of No. 32 twist. At the present time, with one pair of self-acting mule-spinning machines, having 2,124 spindles, one spinner, with the assistance of two small boys, can produce 55,098 hanks of No. 32 twist in the same time. . . . Even in power machinery, a weaver formerly tended but one loom. Now one weaver minds all the way from two to ten looms, according to the grade of goods. In a large establishment in New Hampshire, improved machinery, even within ten years, has reduced muscular labor 50 per cent in the production of the same quality of goods. In weaving in the olden time, in this country, a fair adult hand-loom weaver wove from forty-two to forty-eight yards of common shirting per week. Now a weaver, tending six power-looms in cotton factory, will produce 1,500 yards and over in a single week; and a very recent invention will enable a weaver to double this product.

In many lines of manufactures new machinery has to be put in every few years to keep up with

the competition. Steamers ten years old are usually worthless for fast voyages.

In his "Recent Economic Changes," chap. ii., Mr. D. A. Wells says:

The power capable of being exerted by the steam-engines of the world in existence and working in the year 1887 has been estimated by the Bureau of Statistics at Berlin as equivalent to that of 200,000,000 horses, representing approximately 1,000,000,000 men; or at least three times the working population of the earth, whose total number of inhabitants is probably about 1,400,000,000. The application and use of steam alone up to date (1889) has accordingly more than trebled man's working-power, and by enabling him to economize his physical strength has given him greater leisure, comfort, and abundance, and also greater opportunity for that mental training which is essential to a higher development. And yet it is certain that four fifths of the steam-engines now working in the world have been constructed during the last quarter of a century, or since 1865.

But the present steam-engine will probably be discarded. Many believe that the use of electricity as a motor power will still more revolutionize industry. (See ELECTRICITY. For further illustrations of the productive power of machinery, see PRODUCTIVITY.)

II. SOCIAL RESULTS

In his "Political Economy," Book IV., chap. vi., John Stuart Mill wrote his oft-quoted words: "Hitherto it is questionable if all the mechanical inventions yet made have lengthened the day's toil of any human being." This is considered by many an exaggeration. If hours of labor were at first lengthened by the introduction of machinery they are to-day steadily being lessened. (See EIGHT-HOUR MOVEMENT.) If machinery has developed the factory system, that to-day is by no means what it was. The most evil results of machinery are thus temporary, its good results permanent. Realizing what machinery means in the way of cheapened production and how it makes it possible that wage-earners should own a hundred commodities that the wealthy could not have a hundred years ago, most economists believe that machinery has been to the vast benefit of working men as of all classes. There are, however, two sides to this. The most serious discussion has been on the question of how far machinery has permanently displaced labor. Writers like Mr. Carroll D. Wright claim that if machinery has displaced labor in one direction it has created more employment for them in others. Mr. Wright shows, e.g., in his "Industrial Evolution of the U. S.," chap. xxviii., that the average per capita consumption of cotton in this country was 5.9 pounds in 1830, 13.91 pounds in 1880, and 19 pounds in 1890, which figures, he says, "clearly and positively indicate that the labor necessary for such consumption has been kept up to the standard, if not beyond the standard, of the olden time—that is, as to the number of people employed." In iron he says the increase has been as great proportionally: 105.64 pounds in 1870, 204.90 pounds in 1880, and 283.38 pounds in 1890. In steel it was 46 pounds in 1880 and 144 in 1890. Many occupations have been created. He says (we abridge his words):

If we could examine scientifically the number of created occupations, the claim that inventions have displaced labor on the whole would be conclusively and emphatically refuted. In telegraphy thousands and thousands of people are employed where no one has ever been displaced. Electroplating, a modern device, has not only added wonderfully to the employed list by its direct influence, but indirectly by the introduction of a class of goods which can be secured by all persons.

The railroads offer another grand illustration of the expansion of labor. It now requires more than three quarters of a million of people to operate our railroads, and this means a population of nearly four millions, or one sixteenth of the whole population of the country. The displacement of the stage-coach and the stage-driver was nothing compared to the expansion of labor which the railroad systems of the country have created. As a means of expansion of labor the sewing-machine is a striking illustration. It has displaced no one; it has increased demand, and it has been the means of establishing great workshops to supply the thousands of machines that are sold throughout the world.

Creates Work

The expansion of values as the result of the influence of machinery has been quite as marvelous as in any other direction, for educated labor, supplemented by machinery, has developed small quantities of inexpensive material into products of great value. This truth is illustrated by taking cotton and iron ore as the starting-point. A pound of cotton, costing at the time this calculation was made but 13 cents, has been developed into muslin which sold in the market for 80 cents, and into chints which sold for \$4. Seventy-five cents' worth of common iron ore has been developed into \$5 worth of bar iron, or into \$10 worth of horseshoes, or into \$180 worth of table knives, or into \$6,800 worth of fine needles, or into \$29,480 worth of shirt buttons, or \$200,000 worth of watch-springs, or \$400,000 worth of hair-springs, and the same quantity of common iron ore can be made into \$2,500,000 worth of pallet arbors.

The illustrations given, both of the expansion of labor and the expansion of values, are sufficiently suggestive of a line of study which, carried in any direction, will show that machinery is the friend and not the enemy of man, especially when man is considered as a part of society and not as an individual.

Mr. Hobson, however, who has made a more minute analysis, comes to less pronounced results. He says (as above, pp. 234, 235):

Facts and figures seem to support the following conclusions:

1. That along with the increased application of machinery to the textile and other staple manufactures there has been in these industries a decrease of employment relative to the growth of the working population.
2. That in the transport industries the increase of employment is in inverse proportion to the introduction of machinery into the several branches as a dominating factor.
3. That the considerable diminution of agricultural employment is not compensated by any proportionate increase of manufacturing employment, but that the displaced agricultural labor finds employment in such branches of the transport and distributive trade as are less subject to machinery.

So far, therefore, as the statistics of employments present a just register of the influence of machinery upon demand for labor, we are driven to conclude that the net influence of machinery is to diminish employment so far as those industries are concerned into which machinery directly enters, and to increase the demand in those industries which machinery affects but slightly or indirectly. If this is true of England, which, having the start in the development of the factory system, has to a larger extent than any other country specialized in the arts of manufacture, it is probable that the net effect of machinery upon the demand for labor throughout the industrial world has been to throw a larger proportion of the population into industries where machinery does not directly enter.

Effect on Employment

Machinery has, too, Mr. Hobson argues, a greater effect in increasing the irregularity of employment. He says:

While it is the interest of each producer of machine-made goods to give regular employment, some wider industrial force compels him to irregularity. What is this force? It is uncontrolled machinery. In the several units of machine production, the individual factories or mills, we have admirable order and accurate adjustment of parts; in the aggregate of machine production we have no organization, but a chaos of haphazard speculation. "Industry has not yet adapted itself to the changes in the environment produced by machinery." That is all.

When production was slower, markets narrower, credit less developed, there was less danger of this big miscalculation, and the corrective forces of industry were more speedily effective. But modern machinery has enormously expanded the size of markets, the scale of competition, the complexity of demand, and production is no longer for a small, local, present demand, but for a large, world, future demand. Hence machinery is the direct material cause of these great fluctuations which bring, as their most evil consequence, irregularity of wages and employment.

How far does this tend to right itself? Professor Nicholson

believes that time will compel a better adjustment between machinery and its environment.

"The enormous development of steam communication and the spread of the telegraph over the whole globe have caused modern industry to develop from a gigantic starfish, any of whose members might be destroyed without affecting the rest, into a *myx* *flow* which is convulsed in agony by a slight injury in one part. A depression of trade is now felt as keenly in America and even in our colonies as it is here. Still, in the process of time, with the increase of organization and decrease of unsound speculation, this extension of the market must lead to greater stability of prices; but at present the disturbing forces often outweigh altogether the supposed principal elements."

The organization of capital under the pressure of these forces is doubtless proceeding, and such organization, when it has proceeded far enough, will indisputably lead to a decrease of unsound speculation. But these steps in organization have been taken precisely in those industries which employ large quantities of fixed capital, and the admitted fact that severe fluctuations still take place in these industries is proof that the steady influences of such organization have not yet had time to assert themselves to much purpose. The competition of larger and larger masses of organized capital seems to induce heavier speculation and larger fluctuations. Not until a whole species of capital is organized into some form or degree of "combination" is the steady influence of organization able to predominate.

But there is also another force which, in England, at any rate, under the increased application of machinery, makes for an increase rather than a diminution of speculative production. It has been seen that the proportion of workers engaged in producing comforts and luxuries is growing, while the proportion of those producing the prime necessities of life is declining. How far the operation of the law of diminishing returns will allow this tendency to proceed we cannot here discuss. But statistics show that this is the present tendency both in England and in the U. S.

So long, then, as a community grows in numbers, so long as individuals desire to satisfy more fully their present wants and continue to develop new wants, forming a higher or more intricate standard of consumption, there is no evidence to justify the conclusion that machinery has the effect of causing a net diminution in demand for labor, tho it tends to diminish the proportion of employment in the "manufacturing" industries; but there is strong reason to believe that it tends to make employment more unstable, more precarious of tenure, and more fluctuating in market value.

(See also OCCUPATIONS; UNEMPLOYMENT.)

Less discut but perhaps more important is the effect of machinery upon the *quality* of labor. Some believe that machinery improves labor, taking it out of tenements and rude huts into factories, which are now usually comparatively hygienic (for proof, see article SWEATING, where it is shown how terrible are the conditions in trades not using machinery). Others argue, too, that machinery replaces muscular labor by higher forms of labor. Professor Marshall inclines to this view ("Principles of Economics," 2d ed., pp. 314, 322). Others dwell upon the educative effect of machinery, teaching inventiveness, love of order, cooperation, etc. But there is another side to the question. Says Mr. Hobson (as above, chap. ix.):

As regards those workers who pass from ordinary manual work to the tending of machinery, there is a good deal of evidence to show that, in the typical machine industries, their new work taxes their physical vigor quite as severely as the old work. Prof. Shield Nicholson quotes the following striking statement from the *Cotton Factory Times*: "It is quite a common occurrence to hear young men who are on the best side of thirty years of age declare they are so worked up with the long miles, coarse counts, quick speeds, and inferior material, that they are fit for nothing at night, only going to bed and taking as much rest as circumstances will allow. There are few people who will credit such statements; nevertheless they are true, and can be verified any day in the great majority of the mills in the spinning districts."

Schulze-Gaevernitz shows that the tendency in modern cotton-spinning and weaving, especially in England, has been both to increase the number of spindles and looms which an operative is called upon to tend, and to increase the speed of spinning. "A worker tends to-day more than twice or nearly three times as much machinery as his father did; the number of machines in use has increased more than fivefold since that time, while the workers have not quite doubled their numbers." With regard to speed, "since the beginning of the seventies the speed of the spinning-machines alone has increased about 15 per cent." ("Der Grossbetrieb," pp. 126-127). . . . "There is a temptation," as Mr. Cunningham says, "to treat

the machine as the main element in production, and to make it the measure of what a man ought to do, instead of regarding the man as the first consideration, and the machine as the instrument which helps him; the machine may be made the primary consideration, and the man may be treated as a mere slave who tends it" ("Uses and Abuses of Money," p. 222).

The factory is organized with military precision, the individual's work is definitely fixed for him; he has nothing to say as to the plan of his work or its final completion or its ultimate use. "The constant employment on one sixty-fourth part of a shoe not only offers no encouragement to mental activity, but dulls by its monotony the brains of the employee to such an extent that the power to think and reason is almost lost" ("Contemporary Review," 1889, p. 392).

Dr. Arlidge expresses a decided opinion: "Generally speaking, it may be asserted of machinery that it calls for little or no brain exertion on the part of those connected with its operations; it arouses no interest, and has nothing in it to quicken or brighten the intelligence, tho it may sharpen the sight and stimulate muscular activity in some one limited direction" ("Diseases of Occupations," pp. 25, 26).

A locomotive superintendent of a railway was recently questioned as to the quality of engine-driving. "After twenty years' experience he declared emphatically that the very best engine-drivers were those who were most mechanical and unintelligent in their work, who cared least about the internal mechanism of the engine." Yet engine-driving is far less mechanical and monotonous than ordinary tending of machinery.

Effect on Character

Mr. Hobson concludes:

The net influence of machinery upon the quality of labor, then, is found to differ widely according to the relation which subsists between the worker and the machine. Its educative influence, intellectual and moral, upon those concerned with the invention, management, and direction of machine industry, and upon all whose work is about machinery, but who are not detailed machine-tenders, is of a distinctly elevating character. Its effect, however, upon machine-tenders in cases where, by the duration of the working-day or the intensity of the physical effort, it exhausts the productive energy of the worker, is to depress vitality and lower him in the scale of humanity by an excessive habit of conformity to the automatic movements of a non-human motor. This human injury is not adequately compensated by the education in routine and regularity which it confers, or by the slight understanding of the large cooperative purposes and methods of machine industry which his position enables him to acquire.

Machinery is, too, the creator of the factory system and the factory town. It is this, perhaps, which makes it most unpopular with the worker. Says Mr. Robert Blatchford ("Merrie England," chap. iii.):

My reasons for attacking the factory system are:

1. Because it is ugly, disagreeable, and mechanical.
2. Because it is injurious to public health.
3. Because it is unnecessary.
4. Because it is a danger to the national existence.

The Manchester school will tell you that the destiny of this country is to become "the workshop of the world."

I say that is not true; and that it would be a thing to deplore if it were true. The idea that this country is to be the "workshop of the world" is a wilder dream than any that the wildest Socialist ever cherished. But if this country did become the "workshop of the world," it would at the same time become the most horrible and the most miserable country the world has ever known.

Let us be practical and look at the facts.

First, as to the question of beauty and pleasantness. You know the factory districts of Lancashire. I ask you is it not true that they are ugly and dirty and smoky and disagreeable? Compare the busy towns of Lancashire, of Staffordshire, of Durham, and of South Wales, with the country towns of Surrey, Suffolk, and Hants.

I know that the Manchester school will tell you that this is mere "sentiment." But compare their actions with their words.

To make wealth for themselves they destroy the beauty and the health of your dwelling-places; and then they sit in their suburban villas, or on the hills and terraces of the lovely southern countries, and sneer at the "sentimentality" of the men who ask you to cherish beauty and to prize health.

Or they point out to you the value of the "wages" which the factory system brings you, reminding you that you have carpets on your floors, and pianos in your parlors, and a week's holiday at Blackpool once a year.

But how much health or pleasure can you get out of a cheap and vulgar carpet? And what is the use of a piano if you have neither leisure nor means to learn to play it? And why should you prize that one week in the crowded, noisy watering-place, if health and fresh air and the great salt sea are mere sentimental follies?

III. THE RIGHT USE OF MACHINERY

Some writers, like John Ruskin, imply, if they do not state, that there is no right use of machinery. They say that it must destroy art and life and beauty. (See ART.) Ruskin says in "Fors Clavigera":

A man and a woman, with their children properly trained, are able easily to cultivate as much ground as will feed them; to build as much wall and roof as will lodge them, and to spin and weave as much cloth as will clothe them. They can all be perfectly happy and healthy in doing this. Supposing that they invent machinery which will build, plow, thrash, cook, and weave, and that they have none of these things any more to do, but may read, or cricket, all day long, I believe myself that they will neither be so good nor so happy as without the machines. . . . No machines will increase the possibilities of life. They only increase the possibilities of idleness. . . . There was a rocky valley between Buxton and Bakewell, once upon a time, divine as the Vale of Tempe; you might have seen the gods there morning and evening—Apollo and all the sweet muses of the Light—walking in fair procession on the lawns of it, and to and fro among the pinnacles of its crags. You cared nether for gods nor grass, but for cash (which you did not know the way to get); you thought you could get it by what the *Times* calls "Railroad Enterprise." You enterprised a railroad through the valley—you blasted its rocky away, heaped thousands of tons of shale into its lovely stream. The valley is gone, and the gods with it; and now, every fool in Buxton can be at Bakewell in half an hour, and every fool in Bakewell at Buxton; which you think a lucrative process of exchange.

Wiser, however, seems the position of those who believe that machinery should be largely used, but used to increase the simplicity of life, not its complexity. Mr. Blatchford, whom we have quoted above as opposed to the factory system, would make English life more agricultural and less manufacturing, but he would have machines do even more than they do to-day, only as the servant of the whole community, not as the property of capitalists for whom wage-workers slave. He says:

I propose to make our material lives simple; to spend as little time and labor as possible upon the production of food, clothing, houses, and fuel, in order that we may have more leisure. And I propose to employ that leisure in the enjoyment of life and the acquirement of knowledge. . . . Let us go back to our Manchester street of two working-class families. Suppose, instead of keeping up the wasteful system I described, we abolish all those miserable, imperfect drying-grounds, wringing-machines, wash-kitchens, and kitchen-ranges, and arrange the street on communal lines.

We set up one laundry with all the best machinery; we set up one big drying-field; we set up one great kitchen; one general dining-hall, and one pleasant tea-garden. Then we buy all the provisions and other things in large quantities, and we appoint certain wives as cooks and laundresses, or, as is the case with many military duties, we let the wives take the duties in turn.

So with the housework when we had simple houses and furniture. Imagine the difference between the cleaning of all the knives by a rapid knife machine turned by an engine, and the drudgery of 100 wives scrubbing at 100 clumsy knife-boards.

Says another socialistic writer:

At present machinery completes against man. Under proper conditions machinery will serve man. There is no doubt at all that this is the future of machinery; and just as trees grow while the country gentleman is asleep, so while humanity will be amusing itself, or enjoying cultivated leisure—which, and not labor, is the aim of man—or making beautiful things, or reading beautiful things, or simply contemplating the world with admiration and delight, machinery will be doing all the necessary and unpleasant work. The fact is that civilization requires slaves. The Greeks were quite right there. Unless there are slaves to do the ugly, horrible, uninteresting work, culture and contemplation become almost impossible. Human slavery is wrong, insecure, and demoralizing. On mechanical slavery, on the slavery of the machine, the future of the world depends. . . . A great deal of nonsense is being written and talked nowadays about the dignity of manual labor. There is nothing necessarily dignified about manual labor at all, and most of it is absolutely degrading. It is mentally and morally injurious to man to do anything in which he does not find pleasure, and many forms of labor are quite pleasureless activities, and should be regarded as such. To sweep a slushy crossing for eight hours

on a day when the east wind is blowing is a disgusting occupation. To sweep it with mental, moral, or physical dignity seems to me to be impossible. To sweep it with joy would be appalling. Man is made for something better than disturbing dirt. All work of that kind should be done by a machine.

And I have no doubt that it will be so. Up to the present man has been, to a certain extent, the slave of machinery, and there is something tragic in the fact that as soon as man had invented a machine to do his work he began to starve. This, however, is, of course, the result of our property system and our system of competition. One man owns a machine which does the work of 500 men. Five hundred men are, in consequence, thrown out of employment, and, having no work to do, become hungry and take to thieving. The one man secures the produce of the machine and keeps it, and has 500 times as much as he should have, and probably, which is of much more importance, a great deal more than he really wants. Were that machine the property of all, every one would benefit by it. It would be an immense advantage to the community. All unintellectual labor; all monotonous dull labor; all labor that deals with dreadful things, and involves unpleasant conditions, must be done by machinery. Machinery must work for us in coal-mines, and do all sanitary services, and be the stoker of steamers, and clean the streets, and run messages on wet days, and do anything that is tedious or distressing.

Nicholson's *Effect of Machinery on Wages* (1892); Cooke Taylor's *The Modern Factory System* (1891); Charles Allen's *The Effect of the Factory System* (1904); Carroll D. Wright's *The Industrial Evolution of the U. S.* (1901).

MADDISON, FRED: Labor member British Parliament for Burnley; born 1856 at Boston, Lincolnshire; educated in a Wesleyan school at Hull; learned the compositor's trade; was the first workman member of the Hull Corporation; and was elected president of the Trade-Union Congress in 1886. Later he was editor of *The Railway Review*, the official organ of the Amalgamated Society of Railway Servants, until 1897, and was offered a position in the Labor Department of the Board of Trade in 1902. He sat for Parliament for the Brightside division of Sheffield from 1897 to 1900, and was returned for Burnley in 1906 by Labor votes. Address: 12, Acris Street, Wandsworth, London, S. W., England.

MAGNA CHARTA ("Great Charter"): An instrument signed at Runnymede, June 15, 1215, by King John of England, forced thereto by the barons of the kingdom, led by Stephen Langton, Archbishop of Canterbury. Besides restraining certain royal prerogatives that had been abused, and introducing various improvements into the law, it provided for the protection of every free-man from loss of life, liberty, or property, except by the judgment of his peers or the law of the land, while the king was compelled to say, "We will sell to no man; we will not deny or delay to any man right or justice." Magna Charta was the foundation of English liberties, and its chief protective provisions have been incorporated in the Constitution of the United States and the separate states. (See JURY.)

MAHAIM, ERNEST A. J.: Professor at the University of Liège; born 1865 in Morniques, Hainaut, Belgium; educated at University of Liège; took all his degrees to the faculty of law there, Doctor of Law, Doctor of Political Science, Special Doctor in Public Law and Political Science; was the preferred pupil of the Belgian economist, Émile de Laveleye; studied two years abroad: in Berlin, where he met Schmoller and Wagner; in Vienna, in Paris, and in England. Mahaim is one of the founders of the International Association for the Legal Protection of Working Men.

Professor Mahaim believes in the "Socialism

of the Chair," being largely for the interference of the State in social questions without adopting, however, the collectivist views. He is author of "Études sur l'Association professionnelle," "La politique Commercial de la Belgique," "Enquête sur la situation hygienique des habitations ouvrières a Liège et dans les communes suburbaines," "Enquête sur la situation hygienique des habitations ouvrières dans les communes, Angleur, Grivegnée, Bressoux, et Inpille." Has also written numerous papers on housing questions, etc., for the great periodicals and reviews of London, Paris, Berlin, and Brussels. Address: 9 Avenue du Hêtre, Comte, Sclessin, Belgium.

MAILLY, WILLIAM: Member of National Executive Committee, Socialist Party; born in Pittsburgh, Pa., 1871; spent boyhood in Scotland and England; left school at the age of twelve; worked as errand boy and clerk until return to United States in 1889. Worked in mines and at other manual labor in Illinois and Alabama, and at Nashville, Tenn., as bookkeeper. First active in labor movement in United Mine Workers' Union in Alabama, 1893. Since then has continuously done journalistic work both for labor and socialist party; has acted as organizer both for unions and Socialist Party; was state secretary of Massachusetts Socialist Party in 1902 and national secretary of the party 1903-4. Mr. Mailly believes in a social revolution to be brought about by organization of working class into the Socialist Party; he believes that the political and economic organizations should be kept separate and distinct, but should work together to resist all encroachments of the capitalist class upon the liberties of the workers, whether in the political or economic field; labor-unions at present perform a useful function, tho largely negative in results; but the Socialist Party has the greater function of achieving the ultimate emancipation of labor from the capitalist class ownership and capitalist class rule. Since Feb., 1905, he has been one of the publishers of *The Socialist*. Address: 239 East 84th Street, New York.

MAINE, SIR HENRY JAMES SUMNER, LL.D.: Professor of international law; born in England, 1822; educated at Pembroke College, Cambridge; was afterward a tutor in Trinity College. In 1847 he was appointed regius professor of civil law in the university, but resigned in 1854 to become reader on jurisprudence at the Middle Temple. From 1862-69 he resided in India as law member of the supreme government. On returning to England he was elected professor of jurisprudence at Oxford; next year was made a member of the council of the Secretary of State for India, and was knighted. In 1875 he published as a pamphlet a lecture delivered at Cambridge on "The Effects of Observation of India on Modern European Thought." In 1877 he was elected master of Trinity Hall, Cambridge; in 1887 professor of international law. He died at Cannes in 1888. Among his numerous works are "Roman Law and Legal Education"; "Ancient Law"; "Village Communities"; "Lectures on the Early History of Institutions"; "Early Law and Custom"; "Popular Government"; "International Law."

MAINE LAW, THE: Maine was the first of the United States to pass a vigorous prohibitory act. It was first outlined by General James Appleton,

but perhaps owes most to Neal Dow (*q. v.*). A crude prohibitory law was passed in 1846, but in June, 1851, the law that has since been known as the Maine Law was enacted. (See PROHIBITION.)

MALON, BENOIT: French Socialist; born near St. Etienne, 1841; worked first as a day-laborer, later as a dyer. In 1868 he joined the International, and was imprisoned for three months. On being released he was made one of the society's organizers, and secretary of a cooperative store founded by himself at Puteaux. He later joined the editorial staff of *The Marseillaise*. In 1870 he was again imprisoned for a year. Released by the revolutionaries (Sept. 4th), he was thenceforth a firm opponent of the government. In 1871 he was elected member of the National Assembly, but soon left and joined the Paris Commune. On its overthrow he escaped to Switzerland, where he began publishing a journal, *La Revanche*, which, in 1872, was suppressed by the government. In Switzerland Malon joined Bakursin's Alliance, and fought zealously against the London Council of the International. Leaving Switzerland he traveled through Italy, and at the close of the "seventies" settled in Lugano, where he published a weekly, *Le Socialisme Progressif*, which, however, existed only a short time. In 1879 he went to Zurich, and in 1880, on being granted an amnesty, returned to Paris. At first he inclined toward Marxism; but later, when he had commenced publishing the *Emancipation* at Lyon, he was won by Brousse and became a strenuous opponent of Guesde and Lafargue. From about 1885 until his death in 1893, Malon edited the *Revue Socialiste*. His main works are: "L'Internationale, son Histoire et ses Principes" (1872); "Exposé des Écoles Socialistes Françaises" (1872); "Il Socialismo, suo Passato, suo Presente e suo Avvenire" (1875); "Histoire Critique de l'Economie Politique" (1876); "Le Nouveau Parti" (1881); "Le Parti Ouvrier en France" (1882); "Histoire du Socialisme et des Proletaires" (5 vols., 1881-84); "Le Socialisme Réformiste" (1885); "La Morale Sociale" (1887); "Le Socialisme Intégral" (1890-91).

MALTHUS, THOMAS ROBERT (see MALTHUSIANISM): English sociological writer; born Albury, Surrey, England, 1766; was graduated with honors at Jesus College, Cambridge, in 1788, and in 1797 became a fellow of the college. He entered holy orders and divided his time between the university and a small parish in Surrey. In 1798 published the first edition of his great work under the title "An Essay on the Principle of Population as it Affects the Future Improvement of Society, with Remarks on the Speculations of Mr. Godwin, M. Condorcet, and other Writers." The book aroused very general interest and discussion, and Mr. Malthus went abroad and traveled in Sweden, Norway, France, and portions of Russia, collecting material for a new edition, which appeared in 1803, and was, in his own words, "a new book." He had found, upon investigating the subject, that "much more had been done" upon it "than he had been aware of." It had "been treated in such a manner by some of the French economists, occasionally by Montesquieu, and, among our own writers, by Dr. Franklin, Sir James Steuart, Mr. Arthur Young, and Mr. Townsend, as to create a natural surprise that it had not excited more of the public attention." "Much, however," he thought,

"remained yet to be done. The comparison between the increase of population and food had not, perhaps, been stated with sufficient force and precision," and "few inquiries had been made into the various modes by which the level" between population and the means of subsistence "is effected." The first desideratum here mentioned—the want, namely, of an accurate statement of the relation between the increase of population and food—Malthus supposed he supplied by the celebrated proposition that "population increases in a geometrical, food in an arithmetical, ratio."

This exact mathematical proposition, however, he introduced but incidentally, and omitted in later editions, contenting himself with the general proposition that population, unless checked by war, poverty, etc., tended to increase faster than sustenance. His book ran through various editions, the last of which during his lifetime appeared in 1826 and bore the modified title, "An Essay on the Principles of Population, or a View of its Past and Present Effects on Human Happiness, with an Inquiry into the Future Removal or Mitigation of the Evils which It Occasions."

In 1805 Malthus was appointed professor of modern history and political economy in the East India Company's College at Haileybury. This situation he retained till his death in 1834.

Besides his great work, Malthus wrote "Observations on the Effect of the Corn Laws" (1815); "An Inquiry into the Nature and Progress of Rent" (1815); "Principles of Political Economy" (1820); and "Definitions in Political Economy" (1827). His views on rent were of especial importance, and are believed by some to be the origin of the famous Ricardian law of rent. (See RICARDO; POLITICAL ECONOMY.) The "Encyclopædia Britannica" says of Malthus:

Malthus was one of the most amiable, candid, and cultured of men. In all his private relations he was not only without reproach, but distinguished for the beauty of his character. He bore the popular abuse and misrepresentation without the slightest murmur or sourness of temper. The aim of his inquiries was to promote the happiness of mankind, which could be better accomplished by pointing out the real possibilities of progress than by indulging in vague dreams of perfectibility apart from the actual facts which condition human life.

The only checks on population advocated by Malthus are the moral checks of abstinence from marriage and sexual intercourse. Other checks like war come in as merely natural checks.

MALTHUSIANISM (see MALTHUS) may be defined as the theory, first popularized, tho not first taught, by Malthus, that population has a tendency to multiply faster than subsistence, and that some people must necessarily, therefore, fail to have food unless the race as a whole adopts some measures to prevent the natural increase of its numbers. This is undoubtedly one of the most contested and yet most important questions in social science.

Mr. Benjamin Kidd says ("Social Evolution," chap. viii.): "Underneath all Socialist ideals there yawns the problem of population." Individualism (*q. v.*) rests one of its main arguments upon Malthusianism.

There are two strongly contested views or sets of views upon the subject, but before we can notice these we must see a little more exactly what is meant to-day by Malthusianism. The doctrine as now held by its advocates is not exactly the view advocated by Malthus. Malthus himself somewhat modified his views in the successive editions of his book. (See MALTHUS.) He

omitted from the later editions any exact mathematical statement of the relation between population and sustenance. Secondly, Malthus and the earlier Malthusians based their theory on an asserted general tendency in all animate creation to increase beyond the nourishment prepared for it, as evidenced in the vegetable and animal worlds, in the savage and semisavage civilizations, and even in civilized communities.

Modern Malthusianism, as illustrated, for example, in Pres. A. T. Hadley's "Economics" (1896, pp. 41-51), takes a more scientific form.

Statement

It carefully analyzes the difference between the birth-rate and death-rate of various countries; it finds in agriculture a law of diminishing returns (*q. v.*); it argues that the pressure of population and consequent family responsibility has largely produced the present surplus of food in civilized countries, so that the removal of this pressure would diminish the supply; above all it connects itself with the evolutionary principle of the necessity of natural selection to progress (see *EVOLUTION*), and contends that a removal of the pressure of population would mean biological degeneration.

The correctness of this view is asserted and denied. Most individualists and some Socialists accept the theory at least far enough to admit that there is a tendency for population to outstrip sustenance. The individualists usually assert it to be a necessary principle, and that it cannot be prevented without interfering with social progress. Says President Hadley (as above, p. 41): "If poverty is inevitable and simply represents a sacrifice of individuals for the sake of the progress of the race, we may and must view with resignation a number of evils which can only be made worse by attempting to eradicate them." Socialist Malthusians, however, while admitting that population does tend to outstrip sustenance, argue that competition is not the only path to progress, and that there may and should be found some way of limiting population to the means of sustenance. They urge that not enough attention has been given to the biological principle of progress by functional adaptation and by cooperation of organisms. John Stuart Mill, accepting the Malthusian doctrine, argues that socialism is the state of society most favorable to limiting population to means of sustenance. He says ("Political Economy," Book II., chap. i.):

Results

Another of the objections to communism is similar to that so often urged against poor-laws: that if every member of the community were assured of subsistence for himself and any number of children, on the sole condition of willingness to work, prudential restraint on the multiplication of mankind would be at an end, and population would start forward at a rate which would reduce the community through successive stages of increasing discomfort to actual starvation. There would certainly be much ground for this apprehension if communism provided no motives to restraint equivalent to those which it would take away. But communism is precisely the state of things in which opinion might be expected to declare itself with greatest intensity against this kind of selfish intemperance. Any augmentation of numbers which diminished the comfort or increased the toil of the mass would then cause (which now it does not) immediate and unmistakable inconvenience to every individual in the association; inconvenience which could not then be imputed to the avarice of employers or the unjust privileges of the rich. In such altered circumstances opinion could not fail to reprobate, and if reprobation did not suffice, to repress by penalties of some description this or any other culpable self-indulgence at the expense of the community. The communistic scheme, instead of being peculiarly open to the objection drawn from danger of overpopulation, has the recommendation of tending in an especial degree to the prevention of that evil.

Many, however, deny the correctness of the Malthusian theory. Professor Marshall ("Economics of Industry," p. 31) says:

Malthus's statements with regard to the misery that has existed in past ages have been confirmed by more recent historians; but the practical conclusions that he deduced from them are more liable to be disputed. For he could not foresee the inventions and discoveries which were just about to be made when he wrote. He could not foresee how the growth of steam traffic would enable England, on the one hand, to import food from countries where there was a scanty population; and, on the other, to send out her surplus population to cultivate new soils, and to spread the energy and genius of the English people over the earth.

Professor Symes says ("Political Economy," pp. 10, 11):

There seems no sufficient ground for the assertion that population tends to increase more rapidly than production. In England it is certain that production has increased far more rapidly than population during the past century, and it may fairly be questioned whether the density of the population has not been one of the causes of the high average productiveness of English laborers. These

Objection

not only support themselves, but produce enough to support a large class in idle luxury, a large class in pauperism, a large class who live by crime, and many classes who labor with more or less advantage to the community, but not at work which is directly productive of material wealth. The idle rich and the idle poor, clergymen, schoolmasters, actors, musicians, thieves, domestic servants, and others, have to live on what the directly productive classes produce; and tho in all communities there must be a certain proportion of non-producers, it is doubtful whether a thinly populated country could possibly support so large a proportion as England does at the present day.

On the whole, then, we conclude that every increase of population opens up opportunities for fresh and superior ways of applying labor, and that if the community avails itself of these, the produce of its labor will, in most cases, be more than proportionately increased.

Many seem to forget, too, the enormously increased power of providing food made potent by modern science. Says Mr. D. A. Wells ("Recent Economic Changes"):

Forty years ago a deficient harvest in any one of the countries of Europe entailed a vast amount of suffering and starvation on their population. To-day the deficiency of any local crop of wheat is comparatively of little consequence, for the prices of cereals in every country readily accessible by railroad and steamships are now regulated not by any local conditions, but by the combined production and consumption of the world; and the day of famines for the people of all such countries has passed forever. The extent to which all local advantages in respect to the supply and prices of food have been equalized in recent years through the railway service of the United States is demonstrated by the fact that a full year's requirement of meat and bread for an adult person can now be moved from the points of their most abundant and cheapest production, 1,000 miles, for a cost not in excess of the single day's wages of an average American mechanic or artisan.

Great improvements have been made during the last ten or twenty years in the breeding of live stock and its economical management, whereby a greatly increased product of animal food can be obtained from a given number with comparatively little increased labor or expense. In the matter of dairy produce, recognized authorities in England estimate that the average increase in the yield of milk per cow in that country has been at least 40 gallons per annum since 1878; and this for the 3,500,000 cows in milk, owned by British farmers, "means 140,000,000 extra gallons of milk over and above what the same animals yielded in 1878; and at 6d. per gallon would amount to an extra return of no less than £3,500,000 for the United Kingdom, or £1 per cow."

Furthermore, not only has the supply of food increased, but the variety of food available to the masses has become greater. Nearly all tropical fruits that will bear transportation have become as cheap in non-tropical countries as the domestic fruits of the latter, and even cheaper. Thirty or forty years ago fish in its most acceptable form—viz., fresh—was only available to consumers living in close proximity to the ocean; but now fish caught on the waters of the North Pacific, and transported more than 2,000 miles, are daily supplied to the markets of the Atlantic slope of the U. S.; and sea products of the coast of the latter, transported 2,000 miles, are regularly furnished in a fresh condition to British markets. To this it should be added that on the

very possibility of propagation which Malthus says applied to the animal and vegetable world, the supply of vegetable

Marvelous Increase of Food Supply

and animal (including fish) food can be, under proper care, almost indefinitely multiplied. What can be done is shown in part in Japan. Recent investigations by Professor Rein, of the University of Bonn, Germany, show "that with an area about the same as the state of California (157,000 sq. m.), and with only one tenth of such area practically available for cultivation, Japan supports a population of 36,000,000 almost entirely from her own product. Making due allowance for what may be eked out of the nine tenths taken up by forest, desert, and mountain, it appears that the incredible number of 2,500 inhabitants are supported from each square mile of cultivated land, or four to the acre. It is well known that this can be done on a small scale, but its application to a nation is marvelous." Nothing is wasted in Japan; everything is utilized, and all arable land has been brought to the highest state of cultivation.

There is thus, however, to say the least, no very pressing fear of the world's being unable to sustain its population from lack of food. In the U. S., to ignore all the rest of the world, if our population were as dense as that of France, we should have, this side of Alaska, 555,000,000; if as dense as that of Germany, 658,000,000; if as dense as that of England and Wales, 1,452,000,000; if as dense as that of Belgium, 1,574,000,000, or more than the present estimated population of the globe.

Many opponents of Malthusianism also argue that with increasing civilization and popular education fecundity will, on biological principles, decrease.

The American Cary argued the physiological theory that the total sum of nutriment received by an organized body directs itself, in largest proportion, to the parts of the system which are most used, and that this meant a diminution in the fecundity of human beings, in spite of more abundant feeding, through the greater use of their brains incident to an advanced civilization.

Nevertheless, there is strong evidence claimed for Malthusianism. The possible natural productivity of the human race is undoubtedly very large. It has been calculated by some that population may double itself in thirteen years. Malthus considered it safer to argue that it could at least double itself in twenty-five years. Mill says on this point ("Political Economy," Book I., chap. x., § 2):

The power of multiplication inherent in all organic life may be regarded as infinite. There is no one species of vegetable or animal which, if the earth were entirely abandoned to it and to the things on which it feeds, would not in a small number of years overspread every region of the globe of which the climate was compatible with its existence. . . . It is but a moderate case of fecundity in animals to be capable of quadrupling their numbers in a single year; if they only do as much in half a century, 10,000 will have swelled within two centuries to upward of 2,500,000. The capacity of increase is necessarily in a geometrical progression; the numerical ratio alone is different.

To this property of organized beings the human species forms no exception. Its power of increase is indefinite, and the actual multiplication would be extraordinarily rapid if the power were exercised to the utmost. It never is exercised to the utmost, and yet in the most favorable circumstances known to exist, which are those of a fertile region colonized from an industrious and civilized community, population has continued for several generations, independently of fresh immigration, to double itself in not much more than twenty years. That the capacity of multiplication in the human species exceeds even this is evident if we consider how great is the ordinary number of children to a family where the climate is good and early marriages usual, and how small a proportion of them die before the age of maturity in the present state of hygienic knowledge where the locality is healthy and the family adequately provided with the means of living. It is a very low estimate of the capacity of increase, if we only assume that in a good sanitary condition of the people each generation may be double the number of the generation which preceded it.

Pres. A. T. Hadley (as above, p. 42) says:

The physiological possibilities of the birth-rate in the human race, when not restrained by intellectual, social, or

moral conditions, are thought to be as high as 60 per 1,000, tho no statistics show a birth-rate as large as this over any considerable extent of space or time. . . . The difference between the birth-rate and the death-rate in any one year represents the rate of increase of population for that year. If the birth-rate is 45 per 1,000 and the death-rate 25 per 1,000, the increase of population is 20 per 1,000, or 2 per cent. (For the facts as to birth-rates and death-rates, see BIRTH-RATES AND DEATH-RATES.)

As to the fact that modern civilizations have an oversupply of food, President Hadley argues (idem, pp. 47-51) that this is due to competitive and individualistic family responsibility, and under socialistic conditions would disappear. In uncivilized countries he says there is no surplus of food. The history of the English poor-law, he argues, shows that natural selection has not done its work. Criminals and paupers habitually defy the principle that every man should earn a living for himself and his family. As to the assertion that fecundity necessarily tends to decrease with civilization, President Hadley denies that we have any reason for believing this. He says (p. 48):

It is true that as society exists at present high comfort and low birth-rate are commonly associated, because comfort is made to depend upon prudence. Let the comfort be made independent of prudence, as in the case of the pauper or criminal, and the birth-rate tends to increase rather than diminish. It may not be exactly true, as some Malthusians would have us believe, that the low birth-rate is the cause of the comfort; but it is much farther from the truth to assert that the comfort is the cause of the low birth-rate. Both are the results of a common cause, the exercise of prudence, which gives high comfort and low birth-rate to those who are capable of practising it.

Finally, as to the future, President Hadley argues (p. 43) that the improvements in the arts of producing and utilizing food may increase the power of the world's sustenance, "it is a fact thoroughly established by observation that in any given stage of the arts there is a certain point beyond which increased application of labor and capital does not obtain correspondingly increased supplies of food from a given area."

The views thus quoted present, perhaps, a fair statement of the present condition of the problem. We have quoted President Hadley on the Malthusian side rather than any biologist, because President Hadley is among the latest economists to treat the subject, and because the question is practically to-day economic or psychologic rather than biologic. All authorities are agreed that as a matter of fact in civilized countries to-day there is abundance of food if it were rightly distributed, and that science can at least increase this supply for a considerable time under modern social conditions.

The only question is, What has produced this condition in modern countries? President Hadley, e. g., says that "no amount of facts such as are accumulated by writers like Nitti will prove anything against the Malthusian theory. Statistics show that high comfort and low birth-rate go hand in hand. They are absolutely incapable of showing which is cause and which is effect." Individualists say it is individual responsibility and pressure of existence that causes a low birth-rate, so that under Socialist conditions, removing pressure, you would not have the present supply of food. Socialists claim that under socialism you would increase supply and not increase the rate of human fecundity; and this is mainly a psychologic problem. (See INDIVIDUALISM; SOCIALISM.) As for the problem which is purely biologic, how far progress depends on the strug-

gle for existence and natural selection, see **EVOLUTION**; **INDIVIDUALISM**; **SOCIALISM**; **SOCIOLOGY**.

One other view, however, must be here noticed. Many writers and workers for social reform accept the Malthusian theory as to the tendency to overpopulation, and argue

Neo-Malthusianism

that it is moral and necessary and humane to check population, especially among the poor, by physical means.

This view is sometimes called *Neo-Malthusianism*, and is earnestly defended on moral and humanitarian grounds. Richard Carlisle, Dr. Charles Knowlton, R. D. Owen, James Watson, and later Austin Holyoake, Charles Bradlaugh, and Mrs. Annie Besant (who has since, we believe, given up belief in Malthusianism), were the most active in popularizing this theory among the poor, and in spite of misrepresentation, abuse, persecution, and prosecution in the courts, continued the propaganda, supported by such men as John Stuart Mill, George J. Holyoake, Robert Dale Owen, and a long list of physicians. Knowing well and horrified by the conditions of life in the slums, seeing the suffering involved in large families, feeling that under conditions where modesty and privacy were all but impossible (see **SLUMS**), and hope equally faint, late marriages inevitably mean early prostitution, they argued that Neo-Malthusianism was the most moral course. Women, they said, in the slums were but slaves, sometimes of drunken husbands, at best of foul surroundings. Neo-Malthusianism, they said, was the only practical escape from overpopulation and wretched demoralization. Boldly, therefore, they preached as right what they said the wealthy denounced but practised.

REFERENCES: For further consideration of this question, and for the modern literature of the question, see **BIRTH-RATES** and **DEATH-RATES**; also **SOCIOLOGY**.

MANCHESTER, ENGLAND: Incorporated as a municipality only in 1878, but its municipal industries in magnitude excel to-day those of any other provincial city in Great Britain. Its undertakings not only serve Manchester, but its smaller neighbors. It is the center of an aggregate population of over a million, to whom it supplies water. The area of its gas supply extends to 30,422 acres, and includes 14 outlying townships. Its own population is 631,465 on 19,698 acres. The city possesses the most profitable markets in the country—yielding in 1904-5 a surplus of £14,000 to the municipal exchequer. Its gas undertaking paid over in 1905 £60,000 in aid of rates. Manchester can boast of being the birthplace of free libraries. Infectious diseases, hospitals, cemeteries, slaughter-houses, and laborers' dwellings are also under its control. It has been liberal in its provision of parks for the people. It keeps up a municipal art-gallery and a museum. But by far the greatest work of the Manchester Corporation—its boldest municipal enterprise—is its assistance of the Manchester Ship Canal. To maintain that undertaking it has advanced £5,000,000, and elects 11 members to the Board of Directors against 10 nominated by the company, and it is provided by the Manchester Ship Canal (Finance) Act, 1904, that the right of the corporation to appoint a majority of one on the directorate shall continue in perpetuity. By the provisions of the same act the rate of interest on the £5,000,000 is reduced from 4½ to 3½ per cent, making the annual payment £160,000, which amount is payable in perpetuity, and if in any

year the revenue of the company is insufficient to pay the whole of this amount the balance may be provided by the issue of 3½ per cent preference stock. The city has in hand a large housing scheme and additional sewage disposal works. A great tramway scheme has just been completed. The tramway service has been municipalized and electricity introduced.

On the passing of the Housing Act (1890), Manchester began to develop and has now 1,313 artisans' dwellings. There are 13 sets of baths in the city. The bathers, in 1905, numbered 1,220,463. There are 4 municipal cemeteries. The Manchester public libraries include a central reference library with over 133,000 volumes, 19 lending libraries with news-rooms, reading-rooms, and also, with two exceptions, with children's reading-rooms. The libraries contain 358,287 volumes. The 17 city markets cover an area of 28 acres, and are very profitable, valued at £998,534. The Cleansing Department of Manchester is the largest in the kingdom. The department is a great manufacturing concern: it makes manure, oil, soap, tallow, mortar; it has two large estates of 3,681 acres, upon which part of the refuse of the city is disposed of, and has workshops where it makes implements, vans, railway trucks, brushes, machines, etc. Nearly 2,000 men are employed by the department, which has over 425 horses and 500 vans and carts. The following are significant figures: Average city rate for year ending March 31, 1906, 6s. 8½d. Cost of police (net ordinary payments for last financial year), £72,742; fire brigade, £16,621; hospitals and infectious diseases, £45,386; parks and open spaces, £56,754; lunatic asylums, £17,788; street lighting, £73,563; improvements and buildings, £82,776; highways and sewers, £113,247; sewerage and sewage disposal, £67,972.

MANDELLO, JULIUS GEORGE: Professor of political economy; born in 1868; studied economics and politics in the Universities of Budapest, Geneva, and Strasburg. In 1890 he took the degree of Doctor of Political Sciences, and in 1900 became professor of political economy and finance at the Royal Faculty of Law and Political Science in Pozsony, Hungary. Traveled extensively, spending much of his time in France, Germany, Belgium, and the United States. In England he lectured before the British Association for the Advancement of Science in Oxford, and for one term at the London School of Economics and Political Science of London University on the factory laws of Europe. In 1896 became a fellow in commons at St. John's College, Cambridge, England. Member British Economic Association; American Academy Political and Social Sciences; American Statistical Association. Member also of Institut International de Sociologie and Institut International de Statistique, general secretary of Hungarian Economic Association. Correspondent International Labor Bureau in Basle, editor of Hungarian "Economic Dictionary," and the Hungarian "Economic Review." Besides university lectures and addresses before scientific bodies, Dr. Mandello has lectured a great deal for the university extension and at workmen's clubs, etc. Author of many books and articles on economics, statistics, and social science. Address: I. Tábor utca, Budapest, Hungary.

MANGER, HON. SAMUEL: Member of Federal Parliament of Australia for Melbourne, Vic-

toria; born at Seelong, Nov. 12, 1857. He was educated in the national schools, and became a retail hatter. He was and is still interested in social reform. He is the honorary secretary of the Anti-Sweating League of Victoria, the leader of the Temperance Party in the House of Representatives, president and superintendent of the United Victoria Fire Brigades. He secured the passage of the Fire Brigade Bill, and has represented the government on the board for over twenty years, and was for thirteen years a member of the governing board. He was elected to the Victorian Assembly 1878-1901, and to the first Federal House of Representatives with an overwhelming majority in 1901; reelected 1903. He is a progressive in politics. He is interested in fraternal orders and was Chief Ruler of the Independent Order of Rechabites. Address: 66 Bourke Street, Melbourne.

MANN, HORACE: Educationalist; philanthropist; born 1796, at Franklin, Mass. His father was a farmer in limited circumstances, and the son was early taught self-reliance and independence by a severe and frugal life. He graduated at Brown University in 1819; was admitted to the bar 1823; elected to the legislature 1827; in that body was active in the interests of education, public charities, and laws for the suppression of lotteries and intemperance. In the practise of his profession he adopted the principle never to take the unjust side of any case, and is said to have gained four fifths of the cases entrusted to him, as all juries felt perfect confidence in the honesty of his purpose; 1837-48 was secretary of the Massachusetts Board of Education; introduced a thorough reform into the school system of the state, establishing normal schools, and instituting county educational conventions; opposed corporal punishment in school discipline. He visited Europe, investigated the condition of the schools, and embodied his observations in a published report. By his lectures and writings he awakened an interest in the cause of education that had never been so strongly felt before. For eleven years he labored fifteen hours a day in the interests of better education. In 1848 he was elected to Congress. His first speech in that body was in advocacy of its right and duty to exclude slavery from the territories. "I consider no evil as great as slavery," he said. Opposing Webster on this question, he was defeated by one vote; but on appealing to the people as an independent antislavery candidate, he was re-elected and served till 1853. He was nominated for Governor of Massachusetts by the Free Soil Party, but was unsuccessful. He was chosen president of Antioch College, Yellow Springs, Ohio, accepted the office, and continued in it until his death in 1859.

MANN, JOHN, JR.: Socialist; born in 1863 at Glasgow, Scotland; a graduate of the University of Glasgow, he is now practising as a chartered accountant in Glasgow and London. Mr. Mann has for many years taken an active interest in practical social work, more particularly in connection with housing experiments in Glasgow, and also in the formation and development of the Public House Trust movement, a scheme for controlling the saloons in the interest of the public and for handing over the profits to foster counter attractions. Address: 142, St. Vincent Street, Glasgow, Scotland.

MANN, TOM: English Labor leader, now in Australia; born at Foleshill, Warwickshire, 1856, the son of a colliery clerk. At the age of nine he worked in coal-mines, dragging on his hands and knees heavy trolleys through low, dark passages. He gradually worked his way up, coming to serve an apprenticeship as machinist in Birmingham, and in 1877 going to London as an engineer. He also had a short experience of work in the United States. He early became interested in social movements, and manifested a religious bent. When he came to London he took a Sunday-school class at St. Stephen's, Westminster, but later joined the Swedenborgians. He became an ardent teetotaler at Birmingham, and started "A Mutual Improvement Society." In 1885 he joined the Social Democratic Federation, for which he worked as a lecturer and organizer, taking also a prominent part in the eight-hour agitation. Mr. Mann especially worked among the dockers, and a trade-union was formed, of which he was elected president. In the great London dock strikes (*q. v.*), which almost marks an epoch in the English Labor movement, he was one of the chief leaders, and contributed largely to its satisfactory result. In 1891, appointed by the Conservative administration a member of the Royal Commission of Labor, he signed the minority report; was later chosen first secretary of the London Reform Union; left this post, however, in a year to become the general secretary of the Independent Labor Party (*q. v.*). In 1894 and 1895 Mann was an unsuccessful candidate for Parliament, but polled a large vote. A few years later he went to Australia and is now a Socialist leader there.

MANNING, HENRY EDWARD: Cardinal of the Roman Catholic Church. He was born in 1807 at Totteridge, Hertfordshire; received his education at Harrow and Balliol College, Oxford. After his ordination in the Church of England, in 1832, he was appointed rector of Lovington and Graffham. In 1851, however, he made submission to Rome, and was sent to Rome for further studies. In 1857 he came in close touch with Cardinal Wiseman as provost of the Chapter of Westminster, and was appointed Archbishop of Westminster in 1865, and Cardinal in 1875. During the Vatican Council of 1870 he was a strong advocate of papal infallibility. In his official position he was indefatigable in all kinds of good works, e. g., the care of the poor, the temperance movement, and education, and in his utterances often very radical. He was, with the Bishop of London and the Lord Mayor, one of the committee which settled the dock laborers' strike in 1889. He wrote numerous works, chiefly on ecclesiastical and religious matters. Died Jan. 14, 1892. (See ROMAN CATHOLIC CHURCH; also CHRISTIAN SOCIALISM.)

MANOR: The name given in medieval England to a landed estate. The exact nature of the English manor is, however, in dispute. Professor Nasse argues in a work on "Agricultural Communities of the Middle Ages in England," that down to the Norman Conquest agricultural England was tilled by communities of free peasant proprietors, similar to the communal conception of the German *mark* (*q. v.*). Mr. F. Seeborn, in his "The English Village Communities and the English Manor," has contested this opinion, and argues that the manor, as the estate of a lord or

thane with villeins under him, was the original and universal system in England. Both views find defenders. (See PRIMITIVE PROPERTY.) Authorities at present seem to incline to the views of Seebohm, with, however, some modifications, finding no trace of communal holding, but rather of a feudalism by no means light. (See FEUDALISM.)

MANSFIELD HOUSE: One of the leading and most successful social settlements in East London (Canning Town), founded in 1890, under Congregational auspices, largely under the lead of Mr. Perry Alden, M. P. (q. v.). (See SETTLEMENTS.)

MANSION HOUSE COUNCIL ON THE DWELLINGS OF THE POOR: This important council began its work in the year 1884, but was reorganized in 1903. The objects of the council as stated in the scheme of reorganization are:

1. To study all questions relating to housing and sanitation, especially in London and its suburbs; to watch parliamentary action, and to influence public opinion in connection with the same, and generally to act as a bureau of information in regard to such matters.
2. To encourage and press for efficient sanitary administration on the part of the central and local authorities, and to undertake inspection, where expedient, for testing the efficiency of such administration.
3. To form and assist the work of sanitary aid committees in London and its suburbs and to affiliate to the council, when desired, any other societies or committees working on similar lines within that area.
4. To cooperate with bodies carrying on similar work in other places.

The executive committee of the council promotes the formation of local committees, to consist of persons interested in the sanitary well-being of some special locality and willing to give their services to promote sanitary reform. Such local committees, however, shall pursue their work according to the rules and methods prescribed by the council and shall be affiliated to the council. The Lord Mayor of London is the president of the council, and among its vice-presidents is the Archbishop of Canterbury, the Roman Catholic Archbishop of Westminster, the president of the London Congregational Union, and the chief Rabbi of the Jews. *Secretary's offices:* 31, Imperial Buildings, Ludgate Circus, London, E. C., England.

MANUFACTURES (see also FACTORY LEGISLATION; INDUSTRIAL BETTERMENT, etc.): We are concerned here simply with the facts and statistics of manufactures.

EXPORTS OF DOMESTIC MANUFACTURES

(From the U. S. Bulletin of Commerce and Finance, Sept., 1904)

¹ Includes municipalities having a population in 1900 of at least 8,000.

manufactures entering the international markets of the world, the total exports of manufactures from these countries being, in round terms, \$3,000,000,000, and the total value of manufactures entering the world's international markets being about \$4,000,000,000. A study, however, of the relative growth of manufacture and of exportations of manufactures in these four countries indicates that the U. S. is making more rapid gains than any other of the group.

Studies of production of manufactures as a whole are extremely difficult because no country other than the U. S. makes any measurement, by census or otherwise, of the value of its manufactures as a whole. Estimates have been made by Mulhall and other statisticians of the value of the manufactures produced in the principal countries of the world at various dates. These estimates of the value of manufactures produced in the United Kingdom, Germany, France, and the U. S. are for the years 1888 and 1900, respectively, as follows:

ESTIMATED VALUE OF MANUFACTURES IN THE UNITED KINGDOM, GERMANY, FRANCE, AND THE UNITED STATES, 1888 AND 1900

[Figures of 1888 are Mulhall's estimates, those of 1900 for European countries are estimates of W. J. Clark, those of 1900 for U. S. are census figures of gross production]

POWER EMPLOYED

| | DATE OF CENSUS | | Per cent of increase 1900 to 1905 |
|-----------------------|----------------|-----------|--|
| | 1905 | 1870 | |
| Total horse-power.... | 14,464,940 | 2,346,142 | 39.0 |
| Owned: | | | |
| Steam..... | 10,664,566 | 1,215,711 | 31.0 |
| Gas..... | 289,514 | | 114.9 |
| Water..... | 1,647,969 | 1,130,431 | 13.3 |
| Electric..... | 1,138,208 | | 266.4 |
| All other..... | 91,784 | | 83.6 |
| Rented..... | 632,905 | | 98.1 |

GREAT BRITAIN

No official statements are made in Great Britain concerning the total value and growth of her manufactures, but it is generally understood that manufactures constitute quite four fifths of the exports of the United Kingdom, and of these statistics are given.

EXPORTS OF ARTICLES WHOLLY OR MAINLY MANUFACTURED

| | | | |
|-----------|--------------|-----------|--------------|
| 1891..... | £211,071,300 | 1901..... | £223,823,211 |
| 1893..... | 186,578,295 | 1902..... | 227,537,037 |
| 1895..... | 192,743,374 | 1903..... | 234,787,859 |
| 1897..... | 197,109,161 | 1904..... | 243,825,894 |
| 1899..... | 219,590,874 | 1905..... | 269,767,795 |

¹ Beginning 1899, the exports include the value of ship and boats (new) with their machinery.

In England and Wales 56.9 per cent of the breadwinners are engaged in manufactures and mining; the highest percentage in the world, except Scotland, which is 58.1. In Ireland, 30.7 per cent. (For other details, see COMMERCE.)

GERMANY

For recent statistics, see COMMERCE. No manufacturers' census has been made since 1895. The number of persons employed in the German Empire in trades, manufactures, commerce, etc., according to the census of June 14, 1895, was as follows ("Statistik des Deutschen Reiches," Band 119):

NUMBER OF ESTABLISHMENTS AND OF PERSONS EMPLOYED

| ESTABLISHMENTS GROUPS | Small, 1-5 persons | | Medium, 6-50 persons | | Large, 51 persons and over | | Total | |
|---|---------------------|-----------|----------------------|-----------|----------------------------|-----------|---------------------|------------|
| | Estab- lishments | Persons | Estab- lishments | Persons | Estab- lishments | Persons | Estab- lishments | Persons |
| All Industries: | | | | | | | | |
| Total 1895..... | 2,934,723 | 4,770,669 | 191,301 | 3,454,333 | 18,953 | 3,044,267 | 3,144,977 | 10,269,269 |
| Total 1882..... | 2,882,768 | 4,335,822 | 112,715 | 1,391,720 | 9,974 | 1,613,247 | 3,005,457 | 7,340,789 |
| Increase in per cent of 1895 over 1882..... | 1.8 | 10.0 | 69.7 | 76.3 | 90.0 | 88.7 | 4.6 | 39.9 |
| Industries According to Classes in 1895: | | | | | | | | |
| A. Gardening, cattle-raising, fishing..... | 39,698 | 70,091 | 3,571 | 25,853 | 59 | 7,184 | 42,321 | 103,128 |
| B. Manufacturing, independent of mining and building trades..... | 1,989,572 | 3,191,125 | 139,459 | 1,902,049 | 17,941 | 2,907,329 | 2,146,979 | 8,000,503 |
| C. Commerce and transportation, independent of hotels, inns, and saloons..... | 905,453 | 1,509,453 | 49,271 | 526,431 | 960 | 129,754 | 955,684 | 2,165,638 |

MARK, THE: In the Middle Ages, in Germany, a tract of land belonging in common to a community of freemen who divided the cultivated portion or *arable mark* among their individual members, used the *common* or *ordinary mark*

together for pasturage or general purposes, and dwelt in the village *mark* or central portion. Whether it did or not, the *mark* seems to evidence the early organization of the Germanic tribes, from whence the English came, as they are described by Tacitus. According to Green's "History of the English People," the members of the community holding the *mark* were freeholders, or *ceorls*, tho there were among them *eorls*, distinguished by nobler blood, and from whom the *ealdormen* were chosen as rulers in peace or leaders in war. The choice, however, was purely voluntary, and the *ceorls* had no special legal privileges; and tho preliminary discussions rested with the *eorls*, the clash of arms of the *ceorls* was the final decision. The *witens*, or wise men, of the village met and settled disputes, and later, in England, came together as the *witenagemot*, the origin of Parliament. (For the much-discussed question on whether these *marks* indicate an original communal holding of soil, see PRIMITIVE PROPERTY.) The probability seems to be that the organization was communal, not individualistic; but the communities were more patriarchal than those of equal freemen. (See MANOR.)

MARKHAM, EDWIN: American poet, Socialist; born in Oregon City, Ore., 1852. Spent early life on a California ranch; worked his way through school; became a teacher, and superintendent of schools, then principal of the Observation School of the University of California. In 1897 he wrote "The Man with the Hoe," a poem which attracted universal attention, and has been called "the psalm of labor" and "the battle-cry of the next thousand years." He is now writing an epic poem to be called "Eternitas," which will embody his ripest thought on the life here and hereafter. He meanwhile writes largely for journals and magazines. He believes that the Golden Rule should be the working principle in all social affairs—that Fraternity in Action is the marrow of all gospels and the fulfilment of all revelations.

He believes that Christ's kingdom was intended to be an actual social order—the working-form of God on earth. This would give body to the word of Christ; build his Comrade Kingdom, and

make possible on earth the practise of the Sermon on the Mount. His principal works are: "The Man with the Hoe, and Other Poems"; "Lincoln, and Other Poems"; "Virgilia, and Other Poems"; "The Hoe-Man in the Making" (series on child

labor); "Remarkable Pages from Thomas Lake Harris: Seer and Social Worker" (2 vols.). Address: Westerleigh, West New Brighton, New York.

MARRIAGES (for the history, the social and ethical problems involved, and a general discussion of the marriage question, see articles **FAMILY** and **DIVORCE**): We give here statistics as to marriages.

THE UNITED STATES

In the United States, according to the census of 1870, the proportion of the married to the total population was 37.8; in 1880 it was 37.7; in 1890, 35.7; in 1900, 36.5; but of the last figure the census says "the losses in proportion of the unmarried among the total population are due to a decrease in the proportion of children."

Few states publish the statistics of marriages,

MARSHALL, ALFRED: Professor of political economy; born in London, 1842; educated there and at St. John's College, Cambridge. He was elected fellow of his college in 1865, lecturer on moral science in 1868, which post he held till 1877, when he was appointed principal of University College, Bristol. In 1879 he published his "Economics of Industry," in connection with his wife (*née* Paley). In 1881 ill health sent him abroad; in 1883 he was appointed lecturer on political economy at Balliol College, Oxford; in 1884 he was elected to the chair of political economy at Cambridge University, formerly held by Professor Fawcett. His work, "The Principles of Economics," published in 1890-91, is considered by many economists the most important recent English treatise on the subject. In 1903 he issued "The New Cambridge Curriculum in Economics." Address: Balliol Croft, 6 Wadingley Road, Cambridge, England.

MARX, KARL: Philosopher; economist; Socialist; born in 1818 at Treves of Jewish parentage. Studying at Jena, Bonn, and Berlin, he attracted early attention by his attainments in philosophy, and became a devoted Hegelian. In 1842 edited the *Rheinische Zeitung*, of Cologne, till it was suppressed a year later for its radical utterances. Then went to Paris and made the acquaintance and friendship of Heine, Bakounin, Proudhon, Ruge, above all, of Engels. The two formed an intel-

lectual partnership, and until Marx's death in 1883 worked together in communistic agitation.

In Paris Marx undertook, with Arnold Ruge, the publication of an edition of Hegel's "Philosophy of Jurisprudence," besides other literary labors; but having employed a paper, *Vorwärts*, to attack Prussia, the Prussian Government in 1846 asked his expulsion from France, which was granted, and he went to Brussels. Here Engels joined him, and the two formed a German Working Men's Association, having as its organ the *Deutsche Brüsseler Zeitung*. Their activity attracted the notice of a German communist league of Paris, which sent in 1847 to Marx in Brussels, and to Engels in Paris, asking them to enter the organization, and promising that a congress should be convened in London. The congress was held in the summer of 1847. As a result of this congress and of another held at the end of the year, the theories of Marx were generally accepted and he was asked to undertake with Engels the drawing up of a communist manifesto, which appeared early in the following year. (See MANIFESTO.) The manifesto was later adopted as the creed of the communists or Socialists.

In 1848 the February Revolution broke out. The Brussels authorities feared disturbance, and compelled Marx to change Belgian for French soil. Marx was not at all unwilling, and he proceeded to Paris. A manifesto was at once drawn up for circulation in Germany, in which seventeen demands were advanced by the Communist Party. These demands comprized the proclamation of a republic; payment of members of Parliament so that working men might be eligible for election; the conversion of "princely and other feudal estates," with mines, etc., into State property; the appropriation of all means of transport, as railways, canals, steamships, roads, and posts, by the State; the restriction of the law of succession; the introduction of heavy progressive taxes and the abolition of excise duties; the establishment of national workshops; State guaranty to all work people of an existence and provision for the incapable; and universal and free education. Shortly afterward Marx returned to Ger-

many, and along with Engels, Wolff, and Freiligrath founded the *Neue Rheinische Zeitung* at Cologne, the first number appearing on June 1, 1848. For his utterances Marx had twice to appear at the Assizes, but he was each time acquitted. In May, 1849, there were risings in Dresden and the Rhine Province, and Marx was not slow to give them his editorial benediction. The newspaper was suppressed, and the last number appeared, printed in red ink, on June 19.

Expelled from Prussia, Marx first went to Paris, but, refused residence there, he went to England. His studies were frequently broken, for it was necessary to earn a livelihood, and the duties of correspondent to the *New York Tribune*, which Marx fulfilled for eight years, consumed a large part of his time. His "Zur Kritik der Politischen Oekonomie" bears the date Jan., 1859, a work containing the principles which were afterward to be developed in "Das Kapital." While carrying on his studies Marx came again prominently to the front in 1863 and 1864, when new endeavors were made to unite the working classes of various countries. The result of the agitation was the formation on May 28, 1864, of the International Working Men's Association. (See INTERNATIONAL.) Three years later Marx published the first volume of his great economic work, "Das Kapital." Upon this work rests the reputation of Marx as a political economist.

Marx's later public life was identified with the International (q.v.), of which he was the first president. He became leader of the wing which favored the development of communism by the orderly political capture of the State, as opposed to Bakounin, the leader of the anarchist communist wing, which proposed to

The International

establish communism on the violent overturn of the State. (See ANARCHISM.) Out of Marx's policy has grown the German and now worldwide political Socialist movement, which, accepting the economics taught by Marx, looks to him as its founder. Some believe that this turning of the communistic movement into political channels will be looked upon as Marx's greatest deed—a deed more important than his economic teachings, which, however brilliantly stated, are not peculiar to him. The English-reading public, however, has never done justice to Marx's economic teachings, because it has derived its notion of those teachings mainly from the first volume of "Das Kapital," which was long alone of Marx's writings translated into English. This volume, tho brilliant, is almost purely analytic and critical of the capitalistic movement and economics. His more constructive works are much less known. The reason for the first volume of "Das Kapital" being the one alone translated was that Marx never lived himself to edit the remaining two volumes, tho after his death they were published by Engels from Karl Marx's notes (the second volume in 1885, the third in 1895). Marx died in London, March 14, 1883. One of his daughters married the French Socialist La Fargue (q.v.), and the other the English Socialist Edward Aveling (q.v.).

"Das Kapital."

The best brief account of Marx's economic teachings is to be found in Professor Laveleye's "Socialism of To-day" (chap. iv.). We refer the reader to the article CAPITAL for a critical review by Professor Böhm-Bawerk:

Marx bases his system on principles formulated by Adam Smith, Ricardo, Bastiat, and their followers.

In respect of value, says Marx, commodities intended for exchange are crystallized labor. The unit of labor is an average day's work, which varies in different countries and at different times, but which may be considered a fixed quantity in a given community. An article possesses economic or exchange value only because it represents labor. What can be obtained without labor, like air and water, has no exchange value.

How is the quantity of values of an article to be measured? By the quantity of labor that it contains. The quantity of labor is itself measured by the duration of the labor, by days and hours. Here Marx makes a correction in the theory of Smith and Ricardo, and forestalls an objection. It might be said that, if it is the duration of the labor that creates the value of the products, a coat which took a tailor twice as long to make as was necessary would therefore be twice as valuable. Not so, replies Marx; the measure of the value of things is the duration of the labor on the average requisite, performed with the average amount of skill and diligence, and in the normal industrial conditions at any given time.

From these premises our author concludes that labor becomes more productive and creates more utilities to no purpose; it does not produce more value. In fact, if labor measured by time is the sole source of value, articles manufactured in greater quantity in the same lapse of time, all put together, represent no more value, because each individual article is worth less. By the strictly logical chain of these

Analysis of Value

abstractions we arrive at this singular result, that all the inventions of science, all the improvements of manufacture, produce more utilities without increasing the sum total of exchange values. How, then, does the capitalist make money? First of all he buys machines, tools, raw materials, and then, in order to work up the materials, he purchases the workman's "labor force," *arbeitskraft*, the sole source of all value. He sets the laborer to work to change, by means of the tools and machines, the raw materials into manufactured articles, and sells them for more than they cost him to make. In this way he obtains a greater value, "surplus value" (*mehr-wert*). The money, temporarily transformed into wages and merchandises, reappears under its original form, but more or less increased in amount; it has brought forth young—capital is born.

This would seem to conflict with the principle laid down above, that exchange does not create new value. The manufacturer has only made exchanges, and yet he finds himself in possession of a greater value. The explanation of the mystery is as follows: The capitalist pays for labor its exchange value, and thus obtains its value in use. Labor force has the unique characteristic of producing more than its costs to be produced. He who buys it and sets it to work for his gain enjoys then the source of all wealth. The capitalist pays for labor its value. What is the value of labor? Like all other merchandise, it is worth what it costs in time and trouble to be produced; that is to say, its cost of production. The cost of production of labor is the food and different commodities necessary to support the laborer and the children destined to succeed him. The value of all these commodities is measured in its turn by the time that it takes to produce them. In short, then, according to Marx, the value of labor is equivalent to the sum of hours required to create what the maintenance of the laborer demands. But to produce the commodities necessary for the existence of the laborer and his family during a day, a whole day's work is not needed. Marx supposes that five or six hours suffice. If, then, the laborer worked for himself, he could obtain all he needed in a half day, and the rest of his time he might devote to leisure or to procuring superfluities; but the slave of antiquity, the serf of the Middle Ages, when gaining his freedom in the existing social order, did not at the same time acquire property. He is therefore obliged to place himself in the service of those who possess the land and the instruments of production. These naturally require him to work for them the whole day of twelve hours or more. In six hours the laborer produces the equivalent of his subsistence; this is what Marx terms "the necessary labor"; during the remaining six hours he produces the "surplus value, the *mehr-wert*, to the profit of his employers. The capitalist pays the laborer for his labor-power at its value; that is to say, by giving him the amount of money which, representing six hours' labor, permits him to buy the necessities of life; but as he thus obtains the free disposal of this productive force for which he has paid, he acquires everything it produces during the entire day. He therefore exchanges the produce of six hours against the labor of twelve hours, and puts in his pocket, as net profit, the produce of the six hours beyond the "necessary labor." From this surplus, pocketed by the employer, capital comes into being.

The Capitalist Process

The capitalist has different methods of increasing his profits. The first consists in multiplying the number of his workmen. The second method is to lengthen the working-day. The longer the laborer works beyond the necessary time which represents his wages, the greater the profit he

brings to his master. The third method consists in diminishing the duration of the "necessary labor," the hours which the laborer must work to produce his maintenance. This is done by rendering the labor more productive. As hours of labor obtain the same price, no matter what they produce, if twice as many articles can be made in the hour, each article will cost one half less and the laborer will have one half less to spend on living; he will therefore be able to sell his labor force for a remuneration reduced by one half. All these deductions appear to be irrefutable, and we thus arrive at this singular conclusion, that the more the employment of machines and of improved methods increases the productivity of labor, the lower wages fall and the greater the profits of the capitalist become.

According to Marx, the capitalist régime is of recent origin. It dates from the sixteenth century, when the large proprietors, impoverished by the wars of the Middle Ages, gradually drove their retainers from the soil, and thus formed a landless proletariat compelled to compete for wages. History is to Marx a portion of natural history. He says in the preface to the first edition: "My standpoint from which the evolution of the economic formation of society is received as a process of natural history, can less than any other make the individual responsible for relations whose creatures he socially remains, however much he may subjectively raise himself above them."

According to Marx, the capitalistic era is a necessary epoch which must in time give place to communistic production. Capitalistic production, by compelling workmen to work for simply what is necessary to support life, cuts off its own market, since the workman has no money left to buy with! Hence capital is compelled to turn to commerce to supply it with ever new fields and markets for it to exploit. But this ends. There are no more new worlds for it to conquer, and so it is working its own ruin. Marx says: "One capitalist ever kills many. Hand in hand with this centralization, or the expropriation of many capitalists by few, are developed the cooperative form of the labor process—and that on a constantly increasing scale—the intelligent application of science to technical purposes, the systematic exploitation of the soil, the transformation of the means of labor into means of labor only usable in common, the economizing of all means of production by their use for production by combined social labor, the entwining of all nations in the net of the world market, and thus the international character of the capitalist régime. With the steady decrease of the capital magnates, who usurp and monopolize all the advantages of this process of transformation, the mass of want, oppression, servitude, degradation, and spoliation grows; but the revolt of the laboring class—swelling ever in numbers, and disciplined, united, and organized by the mechanism of the capitalist process of production itself—spreads at the same time. The capitalist monopoly becomes a fetter on the mode of production with and under which it has originated. The centralization of the means of production and the socialization of labor reach a point at which they become no longer compatible with their capitalist integument, and this is burst asunder. The last hour of capitalist private property strikes. The expropriators are expropriated."

The Present Situation

In the first case there is the expropriation of the mass of the people by a few usurpers, but in the latter the expropriation of a few usurpers by the mass of the people.

Marx would make land and all the instruments of production collective and social property. He would go further; he would have all subjects of the State share equally in labor and the produce of labor. His future State is a Labor State in which labor will be compulsory on all who are capable. In "Capital" we find him developing the idea of uniting agriculture with industry, which is advanced in the Communist Manifesto written in 1847. He would have great variety in the labor of the individual, so that he may be as many-sided as possible.

On account of its intellectual brilliancy and acumen, and the influence it has had on Germans, it has been called distinctively "Scientific Socialism"; yet to-day it is not accepted by many scientific Socialists, much less other political economists. In its merciless logic and Hegelian dialectic, it is indeed scarcely possible to pick a flaw; but some Socialists say that it starts from a wrong premise. Marx's error is not his, but inherited from Adam Smith and Ricardo. Labor is not the only source of value. If Adam Smith and Ricardo are right in saying that it is, then Marxian socialism follows. It takes more than labor to produce value. Labor is only one of the elements. Socialists who do not follow Marx's economics arrive at his results, but through other channels. (See SOCIALISM; VALUE.) The acumen of Marx's analysis of the orthodox economics

and his contribution to the development of political socialism are, however, beyond all question. The best account of Marx is in Dawson's "German Socialism" (1888).

MASSONIUS, PIOTR: Polish member of the Russian Duma; born in 1862. Representative (autonomist) from Minsk government. He is a small landowner, and graduate of Minsk College, the School of Pure Science of Warsaw University, and Leipsic University with the degree of Ph.D. Massonius published a series of works on esthetic criticism and Polish history. For a time he was editor of the *Reforma*.

MASTERMAN, CHARLES FREDERICK GURNEY: English Member of Parliament; author; editor; lecturer; born at Rotherfield Hall, Sussex, England, in 1873; educated at Weymouth School and Christ's College, Cambridge. First class in natural sciences tripos, 1895; first class in moral sciences, 1896. President of the Cambridge Union, 1896; fellow of Christ's College, 1900. Elected to Parliament as a progressive Liberal from West Ham, 1906. Literary editor of London *Daily News*; writer for *The Independent Review*; *Speaker Contemporary*. Active in the Christian Social Union. Lecturer for the Cambridge and London University Extension Societies; served as secretary for Children's Country Holiday Fund and as a Guardian of the Poor for the District of Camberwell. Author: "Tennyson as a Religious Leader," "The Heart of the Empire," "From the Abyss," "In Peril of Change." Address: 10 Addington Square, Camberwell, London, S. E.

MAURICE, JOHN FREDERICK DENISON: Founder of Christian Socialism; born Normanston, Suffolk, England, 1805; son of a Unitarian minister. Graduating at Trinity, Cambridge, he took a degree in law, but early devoted himself to writing on religious and social questions, particularly in *The Athenaeum*. In 1831 he entered the Church of England, and went to Oxford and obtained a second class in classics in 1831. His first curacy was at Bubbenthall, Warwickshire, but from 1836-46 was chaplain at Guy's Hospital, London. His writings were already attracting attention. In 1835 he wrote "Subscription vs. Bondage," and an article subsequently enlarged into his "Moral and Metaphysical Philosophy" (1850-57). In his "Kingdom of Christ" (1838), "Lectures on Education" (1839), "Reasons for not Joining a Party in the Church" (1841), he laid the foundations for the theological views of which in the present century he is undoubtedly the great master, with his high conception of the Church and the nation, and yet with a catholic conception of Christianity that found room in it for what—tho he himself repudiated the name—has been later called "Broad Church" divinity. He was chaplain at Lincoln's Inn 1846-59; it is to this period that his Christian Socialist activities belong. (For a full account of this movement, see CHRISTIAN SOCIALISM.) His attention was first prominently called to socialism and its moral significance by Ludlow, but Maurice became the "master" of the little school of thinkers and workers that gathered round, and he proposed the name Christian Socialism, saying that it was the only name that would deliver us to the conflict we must sooner or later wage with unsocial Christians and with unchristian Socialists. He contributed largely to the literature

of the movement, and entered earnestly into the practical details of establishing cooperative tailors' stores; but when this movement had become somewhat established (see COOPERATION) he withdrew to devote himself more purely to educational and intellectual work. He was one of the prime movers in establishing the Working Men's College and the Queen's College for Women and in 1854 became principal of the former. In 1840 he had been made professor of English literature and history at King's College, and in 1846 professor of divinity, but in 1853 he was deprived of his chair because of his theological and social views. 1860-69 he was incumbent of St. Peter's, De Vere Street. In 1866 he was chosen professor of moral philosophy at Cambridge, whence he published "Social Morality" (1869). Died in London in 1872. His writings were numerous and varied. Those bearing directly on social themes we have mentioned. His "Life," edited by his son, appeared in 1884.

MAXWELL, GEORGE HEBARD: Executive chairman of the National Irrigation Association and American Homecroft Society; born 1860, Sonoma, Cal. From 1879 to 1882 he was official stenographer United States Circuit Court and Superior Court; admitted to the bar 1882; in active law practise in California for seventeen years; organized the National Irrigation Association in 1899, and managed campaign for national irrigation ending in passage by Congress of National Irrigation Act in 1902. He organized the Homecrofters' Guild of the Talisman, 1906, and American Homecroft Society, 1907, to accomplish the slogan of the Homecrofters, "Every child in a garden—every mother in a homecroft—and individual industrial independence for every worker in a home of his own on the land."

He is author of "The First Book of the Homecrofters," and "Lectures and Public Addresses." Address: 1409 Fisher Building, Chicago, Ill.

MAYOR AND MAYORALTY: The mayor is the governor of a city. The word is said to have been first used in 1189, when Richard I. substituted a mayor for the two bailiffs of London. In Europe the mayor is not usually elected by the voters, but by the City Council. In England he is usually chosen only for one year. In Germany he may be elected for life, and may be chosen from any city; so that the mayor of a large city is usually one who has shown ability in a smaller city. In Paris the prefect of the Seine corresponds to the mayor, tho there are *maires* of each *arrondissement* in the city. (See PARIS.)

In America the mayors were chosen by the Council in New York till 1834; in Philadelphia, till 1839; but at present most mayors are elected by the people. Their terms of office vary from one year to four years. Their powers, too, materially vary. They usually have a veto power in the Council, the power of appointment and removal, with the consent of the City Council; but in 1882 Brooklyn, under Mr. Seth Low, commenced allowing the mayor to make his own appointments—thinking thus to fix responsibility—and for a while there was a general tendency to increase the power of the mayors. Under a good mayor it worked well. But under a bad mayor it works ill, and the general tendency at present is to put more power in the Council and less power with the mayor. (See CITY.)

MAZZINI, GIUSEPPE: Italian patriot; born Genoa, Italy, 1808. His first tutor was an old priest who taught him Latin, but his omnivorous reading was not directed by any master. At the age of thirteen he attended classes in the faculty of arts at the university, later studied anatomy to follow his father's profession, but finally (1826) graduated in laws, and for some time was occupied in the *Ufficio dei Poveri*. From birth sentiments of social equality were engendered in him by the example of his parents; and very early the degraded political condition of his country began to prey upon his mind. Patriotic enthusiasm gained absolute sway over his spirit, and led him to renounce his cherished idea of a life of literature for the political arena. But in the mean time the "republican instincts," which he tells us he had inherited from his mother, had been developing. His articles accordingly became more and more suggestive of advanced liberalism in politics, and led to the suppression by government of the *Indicatore Genovese* and the *Indicatore Livornese* successively. Mazzini joined the Carbonari, and was entrusted with a secret mission in Tuscany, but in 1830 was betrayed. He was imprisoned in the fortress of Savona on the western Riviera for about six months, when, through deficiency of evidence, he was released, but upon conditions involving so many restrictions that he preferred to leave the country. He went accordingly to France, living chiefly in Marseilles. Here, in presence of "those symbols of the infinite, the sky and the sea," and having access to no books but "a Tacitus, a Byron, and a Bible," he conceived the great mission or "apostolate" (as he himself called it) of his life, and organized a society destined to become famous throughout Europe, *La Giovine Italia*, or Young Italy. Its avowed aims were to be the liberation of Italy, both from foreign and domestic tyranny, and its unification under a republican form of government; the means to be used were education, and, where advisable, insurrection by guerrilla bands; the motto was "God and the people," and the banner was to bear on one side the words "Unity" and "Independence" and on the other "Liberty," "Equality," and "Humanity." In April, 1831, Charles Albert succeeded to the Sardinian throne, and Mazzini, as he afterward confessed, "the interpreter of a hope which he did not share," wrote the new king a letter, urging him to take the lead in the impending struggle for Italian independence. Its bold and outspoken words produced a great sensation, but so deep was the offense it gave to the Sardinian Government, that orders were issued for the immediate arrest and imprisonment of the author should he attempt to cross the frontier. Toward the end of the same year appeared the important

Revolution

Young Italy manifesto. "Congregations" were formed at Genoa, Leghorn, and elsewhere. Banished from Marseilles in consequence of the extensive operations of the society, Mazzini resorted to concealment for several months, principally in Switzerland.

The first fruits of *La Giovine Italia* was the revolutionary expedition of Savoy, organized by Mazzini at Geneva, but defeated by the royal troops. Sentence of death, *par contumace*, was recorded against Mazzini in the Sardinian courts for his participation in the affair; but he soon recommenced with increased vigor his revolutionary operations. A new association, entitled "New Europe," and based on principles of European

rights and enfranchisement, was inaugurated by the exertions of Mazzini in Switzerland. In 1837 Mazzini quitted Switzerland for England, and finally took up his abode in London, where for many months he had to carry on a hard fight with poverty. Ultimately he was able to earn a livelihood by writing review articles, some of which have been reprinted, and are of the highest order of literary merit; they include papers on "Italian Literature since 1830," "Lamennais," "George Sand," "Byron and Goethe," "Lamartine," "Carlyle," and "The Minor Works of Dante." In 1839 he entered into relations with the revolutionary committees sitting in Malta and Paris, and in 1840 he originated a working men's association, and the weekly journal entitled *Apostolato Popolare*, in which the treatise "On the Duties of Man" was commenced. Among the labors undertaken by Mazzini was a free evening school conducted by himself and a few others for some years, at which several hundreds of Italian children received at least the rudiments of secular and religious education. Mazzini did not share the enthusiastic hopes raised in the ranks of the Liberal Party throughout Europe by the first acts of Pius IX., in 1846, but at the same time he availed himself of the opportunity to publish a letter address to the new Pope. The revolutionary leaders had long been in correspondence with Mazzini, and their action, along with the revolution in Paris, brought him to Italy, where he took an active part in the events which dragged Charles Albert into an unprofitable war with Austria; he actually for a short time bore arms under Garibaldi immediately before the reoccupation of Milan, but ultimately, after vain attempts to maintain the insurrection in the mountain districts, found it necessary to retire to Lugano. In the beginning of the following year he was nominated a member of the short-lived government of Tuscany formed after the flight of the Grand Duke, and almost simultaneously, when Rome had, in consequence of the withdrawal of Pius IX., been proclaimed a republic, he was declared a member of the constituent assembly there. A month afterward Mazzini was appointed a member of the triumvirate, with supreme executive power. His tenure of supreme authority was marked by wisdom, moderation, and success. On the surrender of Rome, by Mazzini's advice, however, he quitted the city, and subsequently returned to London. At his instigation risings in Milan (1853) and in Piedmont (1857) were attempted. The Sicilian expedition of 1860 owed as much to the organization of Mazzini as to the command of Garibaldi. In 1865 he was elected by Messina deputy to the Italian Parliament; but the election, to which he himself as a republican would have declined to accede, was canceled by the Parliament. In 1865, after the session of Venice to Italy, his sentence of death was at last removed, but he declined to accept such an "offer of oblivion and pardon for having loved Italy above all earthly things." In 1870 he set out for Sicily, but was arrested at sea and carried to Gaeta, where he was imprisoned for two months. Events soon made it evident that there was little danger to fear from a contemplated rising, and the occasion of the birth of a prince was seized for restoring him to liberty. The remainder of his life, spent partly in London and partly at Lugano, presents no noteworthy incidents. For some time his health had been far from satisfactory, and he died at Pisa,

March 10, 1872. The Italian Parliament by a unanimous vote expressed the national sorrow; an eloquent tribute was pronounced by the president, and a public funeral took place at Pisa, his remains being later conveyed to Genoa. Mazzini said of himself, "I am but a voice crying *action*," but he was in very deed far more. In his "Duties of Man," address to working men, he gives perhaps the fullest expression to thoughts which make many consider him the greatest prophet of the nineteenth century. His watchwords were "duties," and not "rights"; self-sacrifice, and not self-seeking; association, and not competition; democracy, and not government; humanity, and not the individual; God, and not the opinions of mankind. Opposing both socialism and Christianity as they were presented to him, he said:

His Views

Working men, brothers! When Christ came and changed the face of the world, He spoke not of rights to the rich, who needed not to achieve them; nor to the poor, who would doubtless have abused them, in imitation of the rich; He spoke not of utility, nor of interest, to a people whom interest and utility had corrupted; He spoke of duty. He spoke of love, of sacrifice, and of faith; and He said that they should be first among all who had contributed most by their labor to the good of all. And the word of Christ breathed in the ear of a society in which all true life was extinct, recalled it to existence, conquered the millions, conquered the world, and caused the education of the human race to ascend one degree on the scale of progress.

REFERENCES: A translation of his main writings appeared in 1891. There are cheap editions of his *Duties of Man*, of his *Thoughts on Democracy in Europe*, and his literary essays.

MEAD, EDWIN DOAK: Author; editor; born in 1849 at Chesterfield, N. H. He spent his boyhood on a farm and in the village store, but in 1866 entered the employ of Ticknor & Fields, publishers, of Boston. From 1875 to 1879 he studied at English and German universities and returned to America in 1879, since which time he has been engaged in lecturing and other literary work. He was editor of *New England Magazine* 1880-1901; for several years president of Good Citizenship Society and the XXth Century Club of Boston. At present is director of Old South Historical Work in the city of Boston, and editor of the *International Library*. Greatly interested in the movement for universal peace, he was appointed delegate for American Peace Society to the congresses held in Glasgow, Rouen, Lucerne, and was chairman of the executive committee at the congress held in Boston in 1894. Mr. Mead is especially devoted to the better organization of the world and the using of the enormous amounts of money now wasted on great armaments in constructive efforts for the education and general welfare of the people. He works for free trade and for the public control of transportation and other important interests. He is author of "Martin Luther: A Study of the Reformation," "The Philosophy of Carlyle," "The Roman Church and the Public Schools," "Organize the World," "The Influence of Emerson," "The Principles of the Founders," etc. Address: 39 Newbury Street, Boston, Mass.

MENNONITES: A sect of Anabaptists (q. v.), followers of Menno Simons, and found in Switzerland, Germany, France, Russia, and America. First appearing in Switzerland in 1525, in 1683 a colony was established at Germantown, Pa. In 1871 many of them fled from Russia to America. At first they refused to swear in courts or bear arms, and lived a quiet industrial life. They have

now abandoned any unusual social views. (See ANABAPTISTS.)

MERCANTILISTS: Mercantilists is the name given to a school of political economy, if it can be called a school, which advocated the belief generally held till the end of the last century that wealth consists in gold and silver, and that therefore the importation of gold and silver and exportation of goods to obtain gold should be encouraged by the State, and the exportation of gold and silver and importation of goods should be discouraged as much as possible. How this leads to the balance-of-trade theory (*q. v.*) is at once apparent.

The mercantile system, also called Colbertism, restrictive system, and commercial system, obtained from the early part of the sixteenth century until late in the eighteenth century, and its influence is still felt. Most prominent among the statesmen who were mercantilists may be named Colbert, of France; Frederick the Great, of Prussia; and Cromwell, of England. Serra, an Italian, early in the seventeenth century presented a moderate and systematic statement of their views in a work entitled "A Brief Treatise on Causes which make Gold and Silver Abound where there are no Mines." Thomas Mun, in England, a generation later, wrote a valuable treatise from the standpoint of the mercantilists, called "England's Treasure by Foreign Trade; or, the Balance of our Trade the Rule of our Treasure," while Sir James Steuart's "Inquiries into the Principles of Political Economy," published in 1767, may be regarded as closing the development of the theory of mercantilism.

To-day no one holds this view to be correct. (See BALANCE OF TRADE; FREE TRADE; PROTECTION.)

MERCER, JOHN EDWARD: Bishop of Tasmania, Australia; born in 1856 at Bradford, England; writer on sociological topics; educated at Rossall School, Lancashire. He was the first Rossall School missionary to Newton Heath, Manchester, where he stayed for seven years. Later he had a parish for the working classes in the outskirts of Manchester for five years. He was vice-chairman of the Manchester branch of the Christian Social Union, and chairman of the Manchester Social Club; also honorary life member of the Manchester Statistical Society. He is in sympathy with the modern "Social Movement" in the direction of securing greater equality of opportunity and a more equitable distribution of wealth. Author: "Conditions of Life in a Manchester Slum"; "Social Equality"; "What is the World External to Mind?" He was Moorhouse lecturer for 1906-7 on "The Soul of Progress." Address: Bishopscourt, Fitzroy Place, Hobart, Tasmania.

MERCHANTS' GILDS. See GILDS.

MESLIER, JEAN: French priest and Socialist; born at Mazeray-en-Champagne, 1664. The son of poor parents, he attracted the attention of a priest who taught him Latin, and secured him a free scholarship. On obtaining his theological degree, he was ordained priest of Etrépy, where he officiated until his death in 1729 or 1733. It was rumored that he committed suicide.

Meslier served the Church faithfully, and did not deem it consistent with his clerical duties to

voice his socialistic views. Upon his death, however, a "testament" was found in which he set forth his political creed. "I have seen and learned the mistakes, abuses, vanities, follies, and sins of humanity, and I have hated them and abhorred them. During my life I have not dared to speak my thoughts, but I will at least voice them dying." After criticizing religion, and especially the Christian Church, whose founder he considered an impostor, Meslier points out the great disparity between the conditions of men, arguing throughout in favor of the lowly and oppressed, and advising them to stand shoulder to shoulder against the tyrants of the earth.

Meslier's "testament" attracted great attention, especially through Voltaire, who, in 1762, made an abstract of the work. The entire work appeared in three volumes (Amsterdam, 1864) under the title "Le Testament de Jean Meslier."

METAYER, THE (from Latin *mediata*, half), is one who cultivates a farm or land for the owner on condition of retaining a portion, usually one half, of the produce, the owner generally furnishing the stock and tools. *Metayage*, or the metayer system, prevails in Italy, southern France, and to a large extent in the south of the United States.

METHODISM AND SOCIAL REFORM: The evangelization of the masses was the distinctive purpose of John Wesley, the founder of Methodism; but unintentionally and unconsciously to himself, for the fact was not recognized during his lifetime, John Wesley became not only the greatest social reformer of the day, but possibly the greatest in all the history of England. The influence of his work is felt to this day not only in the country where Methodism was born, but in every land where Methodists dwell.

Tribute to the influence of Methodism as a factor in social reform has been paid by the foremost historians. "The man who did most to reform the social life of England in the last century was John Wesley," writes W. Moore Ede, in his history of "The Attitude of the Church to Some of the Social Problems of Town Life." "The Methodists themselves were the least result of the Methodist revival," writes J. R. Green in his "History of the English People." "The noblest result of the religious revival," continues Green, "was the steady attempt, which has never ceased from that day to this, to remedy the guilt, the physical suffering, and the social degradation of the profligate and the poor." Thomas C. Hall, in his work on "The Social Meaning of Modern Religious Movements in England," says: "Probably no factor, nay no four or five factors together, may be said to have had the same social influence for the future of England's empire as the Methodist phase of the evangelical revival. One of the great blessings of this social activity of the evangelical political party was the close union brought about by it with the rising trade-unions of England. There is no prouder chapter in the history of the working democracy than the history of trade-unionism. Its quiet, steady, temperate, cautious advance has been largely due to the character of the men whom Methodism trained, and the sympathy and support extended by men who dared the reproaches of their own class in society and struggled for their brethren against selfishness, prejudice, and slander to secure justice and righteousness."

The results of Methodist activity to which these historians bear tribute were due to the influence upon the character and life of his followers of the type of religion which John Wesley preached, to the interest of the Methodists in the poor and ignorant, and especially to the two institutions which were distinctive of Methodism—the class meeting and the local or lay preacher.

John Wesley was in very truth "an apostle of the poor."

Wesley

His interest in the relief of the poor began while he was a fellow at Oxford University. One of the rigidly observed, if not required, rules of the Holy Club was that its members should give away in relief of the poor all they had left after providing for their own necessities. Wesley in later years wrote: "One of them had £30 a year. He lived on £28 and gave away 40 shillings. The next year, receiving £60, he still lived on £28 and gave away £32. The third year he received £90 and gave away £62. The fourth year he received £120; still he lived as before, on £28, and gave to the poor all the rest." This "one" was John Wesley; and the rule here laid down he observed to the end of his life, never spending upon himself more than £28 a year. As his private income increased his charities increased. His private charities during his lifetime aggregated to \$150,000.

Early in the history of the Methodist movement Wesley began to utilize his societies (his organizations were not recognized as churches until after his death) for the relief of those in need and the distrest. He began systematic relief work as early as Nov., 1740. Under date of Nov. 3, 1740, he writes in his journal, that in order to aid those who are out of work he took twelve of the poorest and a teacher into the society room where they were employed for four months in carding and spinning cotton. He divided London into twenty-three districts and appointed two persons to visit the poor and sick in each district and relieve their need. The visitors were enjoined to observe strictly four rules: "(1) Be plain and open in dealing with souls. (2) Be mild, tender, patient. (3) Be cleanly in all you do for the sick. (4) Be not nice." Wesley never exhibited greater sagacity than in these four rules, "Upon reflection," wrote he, "I saw how exactly, in this also, we had copied after the primitive Church. What were the ancient deacons? What was Phoebe, the deaconess, but such a visitor of the sick?"

Out of the work performed by these visitors has come the organization and the work to-day of the "sisters" in the Wesleyan Church in England and the deaconesses in the Methodist Church in America. The first Methodist deaconess was Mary Bosanquet, afterward the wife of the eminent John Fletcher. She also founded the first Methodist orphanage, which was the forerunner of many similar institutions in England, Canada, and 14 in the United States, conducted by the Methodist Episcopal Church. The Methodist Episcopal Church also has 57 deaconess homes, 24 stations in this country, 19 deaconess homes in Europe, 9 in India, 2 in China, and 1 in Africa, employing in 1907 792 deaconesses and 436 probationers who are preparing to become deaconesses. These deaconesses during the year made over 418,000 visits to the poor in their homes, nursed 5,500 sick in their homes and 12,000 sick in hospitals.

As a result of his efforts to help the poor and the sick, Wesley started, in connection with his

headquarters in London called the Foundry, a medical dispensary—the first free dispensary—after which the Finsbury Dispensary in London, twenty years later, was modeled. The expense of relieving the poor at their homes became so great, and the profit was, comparatively, so little, that Wesley resolved to try whether they might not receive more benefit in the hospitals. He found hospital treatment to be less expensive; but no more good was done than before. He asked the advice of several physicians for the sick, but without advantage. He saw the poor people pining away, and several families ruined, and that without remedy. Finally, as a desperate expedient, he said: "I will prepare and give them physic myself." This he was competent to do. For more than twenty-five years he had made anatomy and physic the diversion of his "leisure hours." His knowledge of medicine was extensive, and his common sense made it of practical value to many persons. His "Primitive Physic," of which at least twenty-three editions were issued before his death, grew out of his medical efforts for the relief of the poor. Medical aid to the poor has always been a distinctive feature of Methodism. Under the auspices of the Methodist Episcopal Church alone in this country there are twenty-five hospitals, much of the service in which is free to poor patients. There are besides hospitals and free dispensaries in foreign lands.

One of Wesley's earliest charities was a widows' home. He had observed for some years many who, altho not sick, were not able to provide for themselves and had no relatives or friends who took enough interest in their welfare to provide for them. These persons were chiefly feeble, aged widows. Wesley leased two houses near by and fitted them up so that they were warm and clean. He took in as many widows as there were room for and provided them with things needful for the body. There are now many Methodist old people's homes, ten of them in American cities under the auspices of the Methodist Episcopal Church.

The Methodists were the first to provide schools in England on an extensive scale for the education of the children of the poor. F. V. P.

Popular Education
Painter, in his "History of Education," says: "Prior to the beginning of the present century (1800) the education of the masses of England was almost entirely neglected. To

Robert Raikes, the founder of the Sunday-school, belongs the honor of having first awakened an interest in popular education." But it was a Methodist woman, Sophia Cooke, afterward the wife of Samuel Bradburn, one of Wesley's preachers, who suggested the idea of the Sunday-school to Robert Raikes, and fourteen years before Raikes began his school at Gloucester, Hannah Ball, a young Methodist lady, had a Sunday-school at High Wycombe. Forty years before Raikes began his Sunday-school, the Methodist colliers at Kingswood, after a sermon preached by George Whitefield in an open field, contributed \$100 toward the erection of a school. Four days later the foundation was laid. Whitefield collected \$200 and Wesley raised the balance. The Kingswood school is one of the historic Methodist institutions. John Wesley also established a school in his own house in London, in which were gathered sixty children over six years of age. Schools were a part of the work of many of his societies in all parts of the country.

The educational spirit displayed by Wesley and his followers in England was early manifested in America. In 1780 small subscriptions were secured for a seminary, and at the General Conference of 1784, at which the Methodist Episcopal Church was organized, Cokebury College was provided for, and Sept. 17, 1787, it was opened. Connected with this mother Methodist Church there are 192 schools—54 colleges and universities, 47 classical seminaries, 12 institutions exclusively for women, in the U. S.; 55 foreign mission schools, and 24 theological institutions. In these schools during the year 1906-7 there were about 57,000 students. There are fifteen other branches of American Methodism, and these together have probably as many more schools with perhaps as many students. Of these other Methodist churches the Methodist Episcopal Church, South, conducts 190 schools with about 34,500 students.

John Wesley also provided a literature for his people. Indeed he may be said to have been the father of cheap literature. He wrote or compiled hundreds of volumes, including pamphlets, books, and magazines. Many of his publications were in the form of penny tracts. By these publications he created an appetite for reading among his followers. His publications were the beginnings of the Wesleyan Book Rooms in London and Toronto and the Methodist Book Concerns in New York, Cincinnati, and Nashville. The establishments in New York and Cincinnati are the largest denominational publishing houses in the world. They have a capital of \$4,200,000 and their annual sales aggregate about \$2,500,000.

In the course of his labors John Wesley found many who were not, strictly speaking, so poor that they needed alms, but yet frequently were in want of a small supply of money. Some of these persons were in business and a small loan for a few weeks or months would tide them over difficulty. But there was no one of whom they could borrow, except the pawnbroker, and to place themselves in his debt was almost to abandon hope. Wesley resolved to try in some way to help such persons. So he devised the scheme of a loan fund. This was started in 1746, about 150 years before a similar scheme was begun by a philanthropic gentleman in New York. John Wesley exhorted those who had an abundance of this world's goods to assist their needy brethren. Fifty pounds (about \$250) were contributed. This sum was placed in the hands of two stewards, who were present every Tuesday morning in order to lend to those who desired any small sum, not exceeding twenty shillings (about \$5), which was to be repaid within three months. The amount which one person might borrow was afterward increased to five pounds (about \$25). Out of this loan fund no less than 255 persons were relieved in eighteen months. This loan fund, or "lending stock," as an institution of the Methodist societies continued for a number of years. Among its beneficiaries was a cobbler named James Lackington, who in 1775 borrowed £5 with which to start a second-hand book shop in connection with his shoe shop. This new business grew more rapidly than his cobbling and in the course of time he gave up the latter. The book business developed into the largest second-hand book store in London, if not in the world. It made its proprietor immensely wealthy, and the year Wesley died, Lackington's profits from his business amounted to \$25,000.

Early in his career Wesley became a pronounced opponent of African slavery. In 1758 a Mr. Gilbert of Antigua visited England, bringing with him four slaves. Two of these were converted under Wesley's preaching, and laid the foundation of the Wesleyan missions in the West Indies, which did much to prepare the slaves of those islands for emancipation. Wesley and the Methodists and the forces which the revival movement called into being were the power which enabled Wilberforce and his associates to compel Parliament to abolish slavery in the English possessions. Wesley denounced American slavery as "the vilest that ever saw the sun." His hostility to slavery was expressed in a volume entitled "Thoughts on Slavery." It was scattered widely in Europe and America, and probably exerted a greater influence upon the public conscience than any other book ever written. The Methodist Episcopal Church at its first conference, in 1784, pronounced slavery to be "contrary to the golden law of God . . . and the unalienable right of mankind, as well as every principle of the Revolution." The first person arrested in America for utterances against slavery was a Methodist preacher, the Rev. Jacob Gruber. Slavery divided the Church in 1846.

Among the most important contributions of Methodism to social reform has been its relation to the trade-union movement. But for the Methodist revival the trade-union as it is known to-day in England would have had no existence.

The miner is the pioneer of the Labor movement. In Methodism he found a faith in keeping with his sturdy, hopeful nature. His attachment for that church is of long standing, and dates back to the time when Wesley discoursed to the pitmen of Northumberland and Durham, who received him with open arms. With

Labor Leaders

the conversion of their souls, many of the miners seemed to receive the gift of tongues and not alone power to tell of the experience of salvation in their hearts, but a consciousness of the social and industrial wrongs of which they were the victims, and to protest against them. Soon they began to organize, and found their leaders among their class leaders and local preachers, who in the class meeting and pulpit had learned to think on their feet and express themselves from the platform in forcible speech. They learned also in their religious meetings the power of organization. "Can there be any more striking tribute to the influence of Methodism upon the mining community," wrote Mr. T. R. Threlfall, secretary of the Labor Electoral Association in 1890, "than the fact that the five miners' members in the House of Commons have all been trained in the Methodist Church, four being past or present local preachers? In the Parliament of 1885 there were six." Mr. Threlfall stated that of the delegates attending the great miners' conferences, when from three hundred thousand to four hundred thousand men are occasionally represented, "it is no exaggeration to say that fully one half served an apprenticeship as local preachers."

The first Labor member of Parliament and the longest in service, Mr. Thomas Burt, is the son of a Methodist miner and local preacher. Next to Mr. Burt the most noted and influential labor leader has been Joseph Arch, organizer of the Agricultural Laborers' Union. He was a local preacher of the Primitive Methodist Church, and his power was due to that fact. Thorold Rogers,

in his great work, "Six Centuries of Work and Wages," says: "I do not believe that the mass of peasants could have been moved at all had it not been for the organization of the Primitive Methodists."

That the Methodist Episcopal Church retains its interest in the conflict between capital and labor is indicated by the following from the address of the Board of Bishops to the General Conference of 1904: "In all this contention (between employers and employees) it need hardly be said that the sympathy of the Church must, to a large extent, be with those concerning whom Abraham Lincoln quaintly said, 'The Lord must like the common people, else He would not have made so many of them,' doubtless having in mind the fact that when Jesus was on earth 'the common people heard Him gladly.' In spite of all the blunders made by labor leaders and the indefensible acts of their followers, philanthropic men must wish them success in every lawful effort to better their condition and secure their rights. But they must learn from their real friends that every act of violence hurts their cause and that law and order must be maintained at all hazards."

Methodist laymen and local preachers are still among the foremost labor leaders in England, and not a few Methodists are leaders in the Labor movement in America. The first two parliamentary secretaries of the Trade-Union Congress of England, Henry Broadhurst and Charles Fenwick, were Methodists. Mr. Broadhurst was also the first representative of labor to hold a cabinet position. The first representative of labor to be knighted by the king, Edward VII. (1907), Sir W. S. Crossman, a working stone-mason, is a Methodist belonging to the United Methodist Church.

Methodist labor leaders, like their founder, John Wesley, are almost invariably ardent advocates of temperance. In the temperance movement Methodists have always been active and are so to-day. No Methodist minister could habitually use alcoholic liquors as a beverage and remain in the ministry. Indeed there is no vice or evil which affects society injuriously to which Methodism is not strongly antagonistic.

D. D. THOMPSON.

MEXICO: A federated republic, its present constitution dating from 1857. Composed of 27 states and 3 territories. Area, 767,080 sq. m., with a population (1900) of 13,606,000, or 17.7 per square mile. Of these 19 per cent only are white, 48 per cent of mixed race, and 38 of Indian race. Of the mixed and Indian races few can be called civilized. Foreigners number 57,507, of whom some 16,000 were Spanish and 15,000 of the United States. There are about 2,000,000 educated whites. The capital of Mexico has a population of 400,000; Guadalajara, 101,000; Leon, 63,000; Monterey, 62,000; San Luis Potosi, 61,000.

The prevailing religion is Roman Catholic, but there is no State Church and all religions are tolerated. Education is backward, tho it is now free and compulsory and much progress is being made.

There were (1904) 9,194 government schools (besides infant schools) with 620,476 pupils, 382,507 boys and 237,969 girls. Industry is backward and agriculture very primitive. Mining employs 100,000, the mineral wealth being very great, particularly of gold and silver. Mexico is the largest silver-producing country

of the world. The total mineral output was over \$100,000,000 in 1904. Coffee and cotton are cultivated to a considerable extent, tho the chief agricultural products are wheat and sugar, and to a less extent pinequin, oranges, dyewood, maize, rice, and tobacco. In 1904 there were 119 cotton factories with 27,706 employees, and 466 tobacco factories. The exports, including bullion, in 1906, were \$135,027,000 (\$92,633,000 to the U. S.); the imports were \$109,884,000 (\$72,509 from the U. S.). Mexico had, in 1906, 13,515 miles of railway. The Tehuantepec Railway, now completed, connecting the two oceans, will compete with the Panama Railway; there are 34,996 miles of telegraphs, 2,466 post-offices, transmitting 77,807,143 newspapers or printed materials, 64,752,789 letters or cards. The mercantile marine comprises 32 steamers and 29 sailing vessels.

The government of Mexico is in general similar to that of the U. S., with executive, legislative, and judicial branches. The president is elected for six years by electors chosen by popular vote. The Congress consists of a House of Representatives elected biannually by adult male suffrage and senators similarly chosen, two for each state. Each state has its own constitution and local government. The revenue (1906) was \$51,269,008; expenditure, \$48,314,646. The funded debt, 445,899,901 Mexican pesos (about \$220,000,000), at 3-5 per cent. The peace strength of the army is 34,500 (officers and men), with a nominal war strength of 79,600. There is a small fleet navy of 4 gunboats and a few other vessels, manned by 198 officers and 965 men. Army and navy are being strengthened. (For general industrial conditions, see LATIN AMERICA.) Rapid progress, however, is now being made under the present generally satisfactory and stable administration of President Diaz, who has been in power almost continually since he began in 1875 as a military dictator. Currency questions which have long been unsettled are being settled and a gold reserve accumulated. Large loans have been favorably located abroad. Railways are extending, new factories being built, and many new colonies receiving concessions from the government. Fear of yellow fever and bubonic plague has been mainly banished by efficient government action.

MICHAELIS, OTTO: Editor; born at Lubeck, Westphalia, 1826. Studied law at Bonn and Berlin; was deprived of his position in consequence of the excitements of 1848. Then betook himself to Berlin, where he became assistant editor of the *Abendzeitung*, and after its suppression, editor of the *Nationalzeitung*. In 1861 was elected to the Prussian House of Deputies; 1867 to the North German Reichstag. He held several political posts, but as his free-trade principles brought him into conflict with the financial policy of the government, he retired. Died Dec. 12, 1890.

MICHEL, LOUISE: Anarchist; born Veoncourt, Haute-Marne, France, 1839. Winning distinction by musical and poetical talents, she opened a school at Montmartre, Paris, in 1860, but early became an active revolutionist. During the Commune worked on committees and fought at barricades in man's uniform; was captured and condemned to death, a sentence changed to transportation; went through all the horrors of the Versailles prisons, and was transported to New Caledonia. After nine years the

Statistics

amnesty allowed her to return, a more determined anarchist than ever. Several times imprisoned, she escaped to London, and started an international school in Fitzroy Street. A remarkable speaker, she was often heard in London, addressing Hyde Park meetings and venting in vehement French her hatred of the bourgeoisie, who shed the blood of her comrades. She died in 1905. She was author of "Memoirs" and "The Microbes of Society," a novel.

MIDDLE AGES: The Middle Ages, which are usually made to reach from about the fifth century to the thirteenth, form a period of great economic and sociologic importance. Dr. Ingram, in his "History of Political Economy," says of the Middle Ages:

"They represent a vast transition, in which the germs of a new world were deposited, but in which little was fully elaborated. There is scarcely anything in the later movement of European society which we do not find there, tho as yet, for the most part, crude and undeveloped. . . .

(For details, see **CHRISTIANITY** and **SOCIAL REFORM**; **CHURCH** and **SOCIAL REFORM**; **FEUDALISM**; **GILDS**; **LAND**; **MONASTICISM**; **EDUCATION**; **FAMILY**; **SERFDOM**; **SLAVERY**; **WOMAN**, etc.)

MIKHAYLITCHEKO, MITROFAN IVANOVICH: Russian member of the Duma; born in 1871; representative (Social Democrat) from the Yekaterinoslaf province for the first Duma; peasant of the village Uritzovo, Voronezh Province; graduate of a Zemstvo school. Served in different estates as manual laborer or clerk, afterward as miner in Shcherbinsk mines. When elected he was working at the Voznesensk mines as a locksmith.

MILITARISM (for the movement against militarism, see articles: **PEACE MOVEMENT**; **INTERNATIONAL ARBITRATION**; **INTERPARLIAMENTARY UNION**; **AMERICAN PEACE SOCIETY**; **PEACE SOCIETY**, English. See also **NAVY**): The following table, with its enormous total of \$1,781,663,179.

THE MILITARISM OF THE WORLD

| COUNTRY | ARMY | | | NAVY | | | Total annual expenditure | Expenditure per capita |
|----------------------------------|----------------|-------------|--------------------|--------------|------------|---------------|--------------------------|------------------------|
| | Peace strength | War footing | Annual expenditure | Peace forces | War forces | Expenditure | | |

¹ Cost and number of native troops, under chiefs and rajahs, not included.

² The report of Great Britain includes the minor colonies, not mentioned separately, e.g., Ceylon, Hongkong, etc.; the expenses of which are borne chiefly by the mother country; the small contributions of these countries toward military expenses are included under Great Britain.

³ Turkey does not publish its budgets; the expenses here given are estimates of the ministry of war for 1907 and 1908.

⁴ The army of China is being reorganized; the old army is that of 1905; the new one, as planned, will have 432,000 men.

⁵ The army of the U. S. as given includes native troops in the Philippines and Indian scouts. The appropriations of the states for their militia are not included in this expenditure.

⁶ Estimated.

⁷ War expenditure includes £100,000 for English army of occupation (4,580 men in 1906).

⁸ The tribesmen and clansmen furnish their own arms; that is the reason why the expenses of the State for the militia are so low.

⁹ The two columns for expenditures added do not make the grand total as given, because the army and navy expenses for Belgium and Peru are found combined under total expenditure of their respective columns only.

shows the extent to which the world lies burdened under a load of militarism. Yet it must be remembered that this is only the direct annual expenditure for armies and navies. To this vast sum must be added a very large portion of the national debts of the world, which to a large extent, particularly with the larger debts, and, not seldom absolutely wholly, may be considered war debts. To this must still be added the enormous sums spent, e. g., in the United States, for pensions to officers and soldiers, which are not included in the table. And these are only the public costs. Besides this are the private losses, of life and health and property, incurred by war, besides the incalculable economic loss involved in the diversion of millions of people, in times of peace as well as of war, to the service of the army and navy, a burden which robs many a country for years of its best young manhood and to escape which much of the best young blood of Europe emigrates to the New World. Moreover, no European country pays its soldiers sufficient wages for them to live, save for the barest necessities, without more or less support from their family—estimated in the case of Germany, e. g., to amount at the very least to 100 marks per year, or \$15,000,000 annually. The table also indicates to an extent the uselessness of all this enormous waste if only international agreement as to disarmament can be reached, because in this list will be found countries like Switzerland with no standing army, save a militia, and countries with practically no navy, like Belgium; which, altho adjoining countries bristling with guns, are as safe or safer than those countries,

Explanation of Table

simply by virtue of international agreement. In making comparisons, however, between countries, even as to the per-capita military expenditure, the circumstances of each country must be remembered. The U. S., for example, in proportion to the size of its standing army has a much higher expenditure than Russia, because in the U. S. wages are high, and the U. S. pays her soldiers a respectable European wage besides their living, while Russia virtually pays her million soldiers nothing besides maintenance. Other differences between countries must be taken into account. The same amount of money represents very different values in different countries. Nations differ still more in their ability to pay the same per-capita expenditure. Still other differences exist. Only in a very general way can the statistics be considered comparable. We have grouped at the end those countries which on the whole may be said to have no standing army, but depend only on a constabulary or militia. Yet in other countries, which are generally considered to have a standing army, the army really amounts to little more than a constabulary. Again, different countries have very different systems of reserves. Generally speaking, in this table we have only enumerated for their war strength reserves to the age of thirty-two or thereabouts. The real fighting strength of countries like the U. S., with small standing armies and depending in case of war largely on volunteers, it is impossible to estimate. Extraordinary expenses have been averaged. Yet when all is said such a statement, particularly of the per-capita expenditure, and still more of the final totals, have deep significance.

One fact that stands is the very great cost of navies compared with armies, an expenditure in which the U. S. now figures very high.

MILITIA (from Latin *miles*, a soldier) is that portion of the military strength of a nation enrolled for discipline and practise, but local in organization, and only called into actual service when necessary. It is the organized national reserve, and includes the "voluntary" organizations of Great Britain and the United States, the National Guard of France, and the Landwehr and Landsturm of Germany. The British system of volunteers originated in the old Anglo-Saxon *fyrð*, and the warlike features of the ancient *posse comitatus*. The British Government appoints lord-lieutenants of counties empowered to command voluntary organizations or to place a levy by ballot upon all non-exempted persons. As a matter of fact, the volunteers are usually sufficient. The militia of the United Kingdom in 1907 (including the militia reserve, 7,700; yeomanry, 27,638, and volunteers, 337,073) is 495,447.

In the U. S. the militia is under the control of Congress in time of war, and in time of peace under the states, subject, however, to the consent and general control of Congress. As a matter of fact the only effective militia are the uniformed voluntary organizations maintained in many of the states as National or State Guards.

In the War of the Revolution there were 231,971 continentals or regulars and 56,163 militia. In the War of the Rebellion there were received into service 2,690,401 men; when hostilities ceased there were 1,000,516 men in service, of whom 978,000 were volunteers, and the national enrolment at the same time exhibited an available reserve of 2,254,063 men. In 1907 the National Guards numbered about 115,000 officers and men. The number liable to serve is about 16,000,000, but are untrained.

MILL, JAMES: Man of letters; economist; born near Montrose, Scotland, 1773; educated at the University of Edinburgh. Was licensed as a preacher in Scottish National Church, 1798; but, changing his religious views, became a tutor in the family of Sir John Stuart, and accompanied him to London in 1802 to begin a literary life.

His first venture was a periodical entitled *The Literary Journal*, in 1803, continued under his editorship till the end of 1806.

In 1806 he commenced his "History of British India," which he carried on along with other literary work, and published in the winter of 1817-1818. The impression produced by this history was such that, in 1819, he was appointed to the post of assistant examiner of Indian correspondence. In 1832 appointed head of the examiner's office, where he had the control of all the departments of Indian administration—political, judicial, and financial—managed by the secret committee of the court of directors. Shortly after appointment to the India House he contributed the articles on government, education, jurisprudence, law of nations, liberty of the press, colonies, and prison discipline to the "Encyclopædia Britannica." In 1821-22 he published his "Elements of Political Economy," a work prepared primarily with a view to the education of his son, John Stuart Mill.

In 1808 he became acquainted with Jeremy Bentham, and was for many years Bentham's chief companion and ally; he was not, however, a mere disciple of Bentham, but a man of profound and original thought and learned in all the departments of philosophy. Between 1806 and 1818

he wrote a great many articles for various periodicals, his principal topics being education, reform, freedom of the press, prison discipline. He contributed largely to the *Westminster Review*. In 1829 published "An Analysis of the Phenomena of the Human Mind." Died at Kensington, 1836.

MILL, JOHN STUART: Philosopher; economist; born in London, 1806; son of the Benthamite philosopher, James Mill (q.v.). Educated by his father, he showed phenomenal precociousness, tho subjected to the strictest mental discipline; he is said to have begun Greek at the age of three, and by the age of twelve to have read most of the leading Greek and Latin authors. At the age of fourteen he took a complete course in political economy and then had a year's travel in Europe, and returned to aid his father in literary work, imbibing his father's liberalism and skepticism. He studied law with John Austin, another Benthamite. In 1823 became clerk in the India House, and remained thirty-seven years, rising from grade to grade. The *Westminster Review* was established in 1823 as a Benthamite organ, and Mill began contributing to it at once. In 1843 he published his "Logic" in two volumes; "Some Unsettled Questions of Political Economy" (1844); "Principles of Political Economy with Some of Their Applications to Social Philosophy" (1848), an epoch-making book. In it political economy is no longer "the dismal science" of cold theory, but the practical study how to cure economic evils; tho on the whole of the orthodox school, it is, nevertheless, progressive. In 1859 he published "Liberty," also "Thoughts on Parliamentary Reform," "Representative Government" (1861); "Utilitarianism" (1862). "Subjection of Women" was Mill's next work, tho not published till 1869. In 1865 appeared his "Examination of Hamilton's Philosophy." The same year he was elected to Parliament for Westminster, tho he refused to make any canvass for the office. His parliamentary career, however, was short and not marked. His subscription to the election expenses of Mr. Bradlaugh and other independent acts cost him his seat in 1868, and he retired to literary life at Avignon. Here he wrote many articles and essays, and for his last public work was engaged in the starting of the Land Tenure Reform Association. His "Autobiography" appeared in 1873, and created great interest; and in it Mill relates, step by step, the development of his views. Beginning as a Benthamite, and working for the utilitarian greatest good of the greatest number, in the autumn of 1826, he tells us, he suddenly asked himself the following question: "Suppose that all your objects in life were realized; that all the changes in institutions and opinions which you are looking forward to could be completely effected at this very instant—would this be a great joy and happiness to you? and an irrepressible self-consciousness distinctly answered No! At this my heart sank within me. The whole foundation on which my life was constructed fell down." From that change he went on, he tells us, to materially change his views. He adopted what he later found was Carlyle's anti-self-consciousness theory, of happiness not as an end, but to be attained only by having another aim, the happiness of others, or some art, etc. He learned to add the susceptibilities to intellect culture. He came also finally to change his social views to a position where he could say of himself and his wife: "Our ideal of ultimate im-

provement went far beyond democracy, and would class us decidedly under the general name of Socialists. . . . The social problem of the future we considered to be, how to unite the greatest liberty of action with a common ownership in the raw material of the globe, and an equal participation of all the benefits of combined labor" ("Autobiography," 1873). He died at Avignon in 1873. After his death his essays on socialism were published.

MILLIONAIRES. See **WEALTH.**

MILLS, BENJAMIN FAY: Social and ethical reform worker; born at Rahway, N. J., 1857; educated at Phillips (Andover) Academy; first graduate of Lake Forest University, Ill.; ordained to ministry in Congregational Church, 1878; pastor Rutland, Vt.; a very prominent revivalist, 1886-97; withdrew from orthodox church, 1897, on account of liberal views; conducted independent religious movement in Boston, Mass., 1897-99; minister of Unitarian Church, Oakland, Cal., 1899-1903; founder and first permanent minister of a new religious organization, the Los Angeles Fellowship, "an Association for the Encouragement of Trustful and Unselfish Living." Editor of *The Fellowship Magazine*. Mr. Mills delivers frequent addresses along constructive religious and sociological lines. He is author of "Twentieth Century Religion," 2 vols.; "The Divine Adventure," "Power from on High," "Victory through Surrender," etc. Address: Los Angeles, Cal.

MILLS, DARIUS OGDEW: American financier; philanthropist; born in Westchester County, N. Y., Sept. 5, 1825. Started on a commercial career in New York City when seventeen years old. He went to Buffalo in 1847 and was appointed cashier of the Merchants' Bank of Erie County. Two years later he removed to San Francisco, whence he traded with the different mining districts. Subsequently he settled as a general merchant in Sacramento, and also bought gold dust. Later he established the banking firm of D. O. Mills & Co., now the leading bank of inner California. From 1864 to 1873 he served as president of the Bank of California. Soon after his retirement his successor caused its wreck and he was called upon to reestablish it. This he achieved within three years. He then returned to New York, where he engaged in real estate and built the Mills Building on Broad Street and three Mills Hotels—establishments where food and lodging can be obtained at a minimum cost.

MILLS, HERBERT ELMER: Economist; born at Salem, N. H., 1861; educated at Universities of Rochester and Cornell. He is author of "The French Revolution in San Domingo" (1891); "Practical Economic Problems" (1893); "The Labor Problem" (1895). Since 1890 Professor Mills has held the chair of economics at Vassar College. Address: Academy Street, Poughkeepsie, N. Y.

MILLS, HERBERT V.: Unitarian minister; born 1856, in Accrington. Apprenticed as an engineer, he left this position and eventually became a Unitarian minister, with a chapel at Hamilton Road, Liverpool, and more recently at Market Place, Kendal. He founded the Home Coloniza-

tion Society in 1887, and is now a leading director of the Starwaite Colony, an experiment at employing the unemployed. (See **LABOR COLONIES**.) Author: "Poverty and the State," and other books and essays.

MINERS' UNIONS (for the United States, see **ARTICLES UNITED MINE WORKERS; WESTERN FEDERATION OF LABOR**): In Great Britain the miners' unions are among the strongest trade-union bodies. There were in 1904 some 69 unions (50 registered), with 2,197 branches and 501,248 members. Of these the strongest unions are the Durham miners (89,914 members), organized in 1869; the Yorkshire miners (56,690), 1858; the Northumberland miners (23,364), 1863; the Derbyshire miners (24,429), 1880; the Nottingham miners (20,982), 1880; the Lanarkshire, Scotland, miners (25,500) and the Lancashire and Cheshire Miners' Federation (33,301), 1897; and the large South Wales Miners' Federation (117,097), 1898. A general (British) Miners' Association was formed as early as 1841, but did not endure, tho for a time largely influential. The present Miners' Federation of Great Britain (organized 1887), including the large majority of the miners, and is one of the strongest trade-union bodies in the world. By its size and strength it plays a leading part in the British Trade-Union Congress and has developed international relations with Continental miners. Historically the miners have always been somewhat in the lead, in reaching early effective organization, in getting the sliding scale and arbitration, in entering political activity, altho doing this before the present socialistic movements, their representatives were elected largely as Liberals, and many of the unions have so continued, so as to form a class by themselves known as miners' members, distinct from the Labor Party, and on most points less radical. (For other countries, see those countries.)

MINIMUM WAGE: On July 18, 1874, Mr. Lloyd Jones, a journalist in active touch with trade-unionists, wrote in *The Beehive*, a labor paper, against the sliding scale then prevalent in many industries, particularly in the Northumberland mines. He declared the sliding scale dangerous and demanded that a minimum wage should be fixed, below which wages should not fall under any conditions. Other writers, notably Professor Beesly, supported Mr. Jones, and ever since the minimum or living wage has been much discussed, and recently widely advocated, especially in England. One of the points in the early discussion was the question whether the State had any right to interfere with the private compensation between employer and employee. This seems no longer a questionable matter since the State has enforced a number of laws embodying this principle—laws passed by legislative bodies in very many countries.

It appears from the studies of Charles Booth in London, and Mr. R. S. Rowntree in York, that about 12,000,000 people in Great Britain alone are living just on or below the level of bare subsistence. The agitation in behalf of a minimum wage has already such an effect that public authorities in England, both central and municipal, have introduced clauses into their contracts to the effect that wages must not fall below a certain standard for specified work. Investigations, however, soon brought out the fact that the law was circumvented, not directly but indirectly, by

the contractors paying a correspondingly lower price on work done for private customers, for instance in the tailor's trade.

The agitation in England is now occupied with the education of the public in this respect and with the passing of laws which will obviate the possibility of acts of injustice like the one just mentioned. It is proposed that all employers be compelled to pay a minimum wage, not in one locality only, not in one line of industry only, but everywhere and in all lines of work. The agitators have found, however, that all well-organized trades had already largely taken care of this matter as far as they were concerned. The question narrowed itself down, consequently, to the unorganized trades and to women wage-earners. The discovery was made, moreover, that the cost of food and clothing was practically the same all over Great Britain, but that rents varied greatly. The agitators propose, therefore, that a central board should be appointed for the purpose of finding out what wages will suffice to maintain workers in physical and mental health in the different localities, and to fix the minimum wage accordingly. It is proposed that local boards will be entrusted with the administration of the Minimum Wage Act—to be passed upon the recommendation of the central board.

The advocates of this plan point to the great success which similar laws have had in Australasia, especially in Victoria and New Zealand, where wages have risen all around instead of the minimum wage becoming the standard wage as some people feared. They point also to the fact that, since the real difference in the cost of living is *rent*, both employers and employees would be willing to go to the country, where this item is so much lower. The direct benefit of such a law would be the decrease of pauperism; the indirect but vastly more important one the increase of physical and mental efficiency of the working men.

Concerning the working of the Australasian minimum wages laws Fabian Tract on "The Case for a Legal Minimum Wage" says:

The New Zealand Arbitration Acts, the effect of which has been the institution of legal minimum rates of wages on the basis of what each trade arbitrated upon will bear, entails upon the members and officials of the Conciliation Boards and the Court of Arbitration a vast amount of labor in settling multitudinous points of great difficulty which would not arise here under a minimum wage law. Some idea of what those labors have been may be formed from the following quotation from "State Experiments in Australia and New Zealand," by the Hon. William Pember Reeves:

"The trades that have come under the awards of the tribunals have been those of the bootmakers, seamen, gold-miners, coal-miners, printers, tailors, millers, carpenters, plumbers, painters, molders, drivers, saddlers, tailoresses, dressmakers, sawmillers, engineers, iron-workers, furniture-makers, bakers, confectioners, butchers, grocers' assistants, and others of less importance. The questions arbitrated upon have already included most of the hard nuts which students of labor conflicts know so well. Among them are hours

of labor, holidays, the amount of day wages, the price to be paid for piece-work, the proportion of apprentices, the facilities to be allowed to trade-union officials for interviews with their men, the right of employers to engage non-unionists, or to discharge or refuse to engage unionists, the conduct of unionists in refusing to work side by side with 'free laborers,' and pressure exerted by employers to induce them to join a private benefit society."

Yet, in spite of the hardness of the nuts mentioned by Mr. Reeves, they have been successfully cracked without any serious strain upon the machinery provided for the purpose, or any strong or widely spread dissatisfaction arising with the methods adopted.

Again, the Shops and Factories Act of the State of Victoria, Australia, which so far is the boldest experiment entered upon for the stamping out of sweating and industrial parasitism, necessitates an elaborate system of inquiry and inspection

Australian Laws

in each trade brought under the act. The measure, besides being one for the regulation of factories and shops on the ordinary lines, also contains clauses which make it an actual minimum wage law, and accordingly deserves special attention.

The act as passed in 1896 provided for the appointment of special boards to fix wages and piece-work rates for persons employed either inside or outside factories in making clothing or wearing apparel or furniture, or in breadmaking or baking, or in the business of a butcher or seller of meat. Special boards might be appointed for any process, trade, or business usually or frequently carried on in a factory or workroom provided a resolution had been passed by either House of Parliament declaring it to be expedient to appoint such a board. The special boards were to consist of not less than four or more than ten members and a chairman, and to hold office for two years. Half the members (elected as prescribed) were to be representatives of employers and half of employees. If the employers' or employees' representatives were not elected the Governor in Council was given the power to appoint representatives. He was also empowered to fill all vacancies. The members of a board might elect a chairman (not being one of such members); if they did not elect a chairman the Governor in Council might appoint one. The members of these boards were to be paid 10s. per full day, 5s. per half day, the chairman £1 per day with traveling allowances. A board might fix either time rates or piece-work rates, or both; might also fix the hours for which the rate of wages was determined, and the payment for overtime, and in fixing wages might take into consideration the nature, kind, and class of work, and the mode and manner in which the work was to be done, the age and sex of the workers, and any matter which might be prescribed by regulation. A board could settle the proportion of apprentices or improvers to be employed in any process, trade, or business, and the wage to be paid to them; and in fixing such wage might consider age, sex, and experience. The determination of a special board was to apply to every city and town and might be extended by the Governor in Council to any borough or shire or part of a shire. A board could determine that manufacturers might be allowed to fix piece-work rates based on the minimum wage. That is to say, the board, after fixing time wages itself, might leave it to employers to pay a fair equivalent to their piece-workers. The Chief Inspector might, however, challenge any rate so paid, and the employer might have to justify it before the board.

The boards set up for the baking, clothing, bootmaking, shirt-making, and underclothing trades, in spite of intricate complications, found it possible to arrive at determinations which have given general satisfaction. The furniture trade board had the most onerous task, as certain sections of the trade are in the hands of the Chinese, whose idea of honoring factory acts of this kind is to contravene them. Though collusion between Chinese masters and their Chinese work-people to outwit the inspector in matters of wages and hours was glaringly obvious, the cunning of the yellow man was too often superior to that of the representative of the law when it became a question of securing legal proof that the regulations had been broken. Yet even here sweating has been checked to a very great extent, and the conditions of the trade in 1901 were reported as far superior to those prevailing before the establishment of the wages board.

It is important to note that the alleged tendency of a minimum wage to become the maximum has not shown itself. In May, 1902, the Chief Inspector asserted that whereas in the clothing trade, in 1901, the minimum wage for adult males was 45s. per week, the average paid was 53s. 6d. For adult females the minimum was 20s., the average, 22s. 3d. He instanced similar differences in the boot, furniture, and shirt-making trades.

Owing to the favorable results of the working of these six boards, twenty-six other trades have been brought under the operation of the act—among others, the aerated water trade, artificial manure making, bedstead making, brassworking, brewing, brickmaking, coopering, dressmaking, jam-making, iron-molders, pastry cooks, plate-glass making, stoncutting, tinsmithing, woodworking, etc., etc.

By the end of 1904 determinations had been made by the above thirty-two boards, except in the case of the tinsmiths, where the fixing of piece-work rates caused delay. In all cases rises in wages had been made, and in nearly every instance the staff of inspectors reported that the decisions of the boards had been acted upon without any serious friction taking place. In two industries only does it appear that trouble arises. One is the furniture trade, which suffers from the blight of yellow labor. According to the Chief Inspector's report of Dec., 1904, a case of evasion by a white firm engaged in the furniture trade was discovered, and the employer was compelled to hand over to his underpaid workmen the sum of £40 each. It should be mentioned in passing that a weakness of the act is that no provision appears to be made for punishing the men as well as the employers in a case of collusion. The other of the two troubled trades is that of dressmaking. Here dissatisfaction has been caused by the low minimum wage fixed by the board, which, following the example of all the other boards, based its award upon the principle of giving what the trade would bear.

In 1903 a court was created in order that appeals against

the determinations of the wages boards might be heard. By Dec., 1904, only one case had come before the court—an appeal by the employers in the artificial manure industry against a decision fixing a minimum wage of 40s. 6d. The employers were successful, the award being reduced to 36s. This dearth of employment for the Appeal Court may fairly be taken as further evidence that the act is working smoothly.

The Victorian Act, 1896, was intended as an experiment to be tried for three years only. In 1899 it was amended slightly and extended for two years plus a session of Parliament. In 1902, when a sudden dissolution of the Victorian Parliament endangered it, an act was got through again extending its life, this time until 1905. The Chief Inspector of Factories, in Dec., 1904, reported strongly in favor of the act being made a permanent one. Last year (1905) the act was again renewed.

MINING (for statistics of production, see articles COAL; GOLD AND SILVER; IRON. See MINERS' UNIONS; UNITED MINERS OF AMERICA; WESTERN FEDERATION OF MINERS):

The following article, contributed by Mr. Peter Roberts, presents the economic and industrial conditions in coal-mining in the United States. (For other countries, see those countries; also WAGES, etc.)

The value of a mine depends upon the cost per ton the coal can be produced, which varies in every mine. In no industry are fortunes made more rapidly and in none are they lost as quickly if conditions are unfavorable. Cost of mining depends upon the depth at which coal is found, the capital necessary to develop it, the purity and thickness of the seam, the ease or difficulty in developing the mine, the amount of water encountered, the character of the floor and roof, the amount of gas encountered, the presence of faults, and the market reputation of the coal. Another item that must be considered is the labor-supply and the quality of the men available.

The capital sunk in the 6,000-odd mines in the U. S. cannot be accurately estimated. In the anthracite industry it takes \$500,000 to sink shafts, develop the mines, and build the necessary equipment to get out the coal and prepare 2,500 tons per day for market. A bituminous mining-plant is not as expensive; the average bituminous plant of the above capacity would not cost more than half the above sum. Of course, it largely depends upon the geological conditions of the coal-fields to be developed. Taking the coal industry in general, it requires a capital of \$2.50 for every ton of coal marketed.

The item of labor expenses is by far the most important in the coal industry. The wages of the mine employees depend upon the price paid per ton and the number of tons mined. Those paid by the day depend upon the amount paid per day, and the number of days worked in the year.

The contests about wages have been long and often. The lowest point reached per ton, in modern times, was in 1897, when miners were paid about forty-five cents per ton for mining bituminous coal. The rate to-day is double that. The wage of day-workers is regulated by the price paid per ton for mining. Skilled workmen get from \$2.50 to \$3 a day, helpers from \$1.75 to \$2. Wages in the anthracite and bituminous mines are about the same to-day, but the length of the work-day in the former is nine hours and in the latter, where the United Mine Workers' Association is dominant, eight hours.

The bane of mine workers is intermittent labor.

Taking the employees as a whole, the average year would not give them 220 days' employment, while years of industrial depression cuts the figure down thirty or fifty days. This is inevitable and caused by the average atmospheric temperature of the year, the change of the seasons, the variation of industrial activity, and the excessive development of mining-plants beyond market capacity.

Intermittent labor is the cause of industrial friction. Three dollars a day for eight or nine hours

Intermittent Labor is good pay for men of the skill and training needed in mining, but as they get only 200 days' work in the year, the annual wage is hardly enough to meet the requirements of a family living according to the American standard of living. If the wages fall from 20 to 30 per cent and coincident with the fall of wage, fewer days' employment at the mines, we see that the \$600 a year may easily be cut one half. These conditions have occurred and may yet occur in the industry and produce the grave crises which have attracted world-wide attention.

Another fact that has aggravated labor conditions in this industry is the advent of so many foreign-speaking men into the industry. More than 60 per cent of the labor employed in the mines of Pennsylvania is non-English-speaking. The Slav, Lett, Italian, and Magyar have a standard of living much lower than the American, hence they are able to work for lower wages, and still save money to enable them to live during days of idleness. This replacement of English-speaking employees has gone on for the last twenty years, so that to-day the majority of the labor force in the industry is from the south-eastern countries of Europe. The competition between these two elements of the mining labor force goes on daily. The mining of coal becomes daily more difficult and the English-speaking miner cannot compete with the Slav or Italian; the one pushes out the other, and mining communities that were once abodes of prosperous English, Irish, Scotch, Welsh, and German wage-earners are to-day wholly given over to the "foreigners."

The recent immigrants from southeastern Europe have sturdy bodies and willing hands, but they are ignorant, superstitious, unclean, and intemperate. These qualities are prominent in communities settled by them, so that their homes are far from what American homes are, the prevalence of the saloon is astounding, and the record of crime is appalling.

The "foreigners" are found not only in Pennsylvania, but in Ohio, Indiana, Illinois, Colorado, and West Virginia. Farther south in the Appalachian fields, in Kentucky and Tennessee and Alabama,

Foreign Laborers

the presence of the negro and mountain white—men who work for seventy-five cents and \$1 a day—keeps out the "foreigner." Another cause is that, coming to the states above mentioned, the "foreigner" who knows not a word of English can earn from \$1.75 to \$2 a day as soon as he enters the coal-fields.

The truck system is found in many coal operations. It is invariably the accompaniment of individual operators; large corporations, when they come into control, do away with it and run their collieries on a cash-payment basis. The truck system is often a necessity. An operation opened in the mountains of West Virginia, far from towns and inhabited localities, must introduce the truck system. The operator must not

only open the mines but he must also build houses for his employees, secure them the means of subsistence, and keep on hand the articles of comfort and luxury needed by the families. The operator often builds the house of worship and the schoolhouse; every inch of land is owned or leased by him, which is the first condition of the operation. If the operator wishes to exploit his workmen, there is nothing to stop him under these conditions. That operators do so is too well known, but it should also be known that some of the best examples of capitalists' generous dealing toward their employees is found in the coal industry.

The curse of the truck system has been justly denounced and legislated against in many states in the Union, but it should be known that it is found in its worst forms under individual operators, and whatever evils may be charged against large corporations that come into control of large areas of the coal-fields, it should be said to their credit that coincident with their control the truck system is discontinued.

The anthracite coal-fields are practically all under the control of a monopoly. The product is a natural monopoly, and the eight **Truck System** railroads that tap the territory are bound together by a community of interest that makes their policy one.

Monopolistic Control Railroad interests also control the coal industry in Colorado, Utah, New Mexico, Illinois, as well as large portions of Indiana, Ohio, and Pennsylvania. The drift of modern times is toward monopolistic control of the coal-fields of the U. S., and what has taken place in the anthracite field will ultimately come to pass in the bituminous fields.

The evils of monopoly are so well known that the average reader can count them on his fingertips. There is another side to the question. Unrestricted competition of coal operators in the anthracite fields was the curse of the industry. Auction sales of coal in New York were common, and the price realized did not pay the cost of mining. The individual operators who sold out to the Philadelphia & Reading Coal & Iron Company in the early seventies of the eighteenth century were bankrupt because of free competition, and the mines were idle when the large corporation took up the properties. The same is true to-day in the bituminous fields where free competition prevails. I know men who have mined coal at a loss, and others who have not made more than three cents a ton on their operations. The system is also wasteful. Under the frenzy of the struggle for existence, individual operators produce recklessly, having no thought of the demand of the market, and thus one of the most precious resources of the country is thrown on the public at prices that make economy impossible. This fuel supply of the U. S. is to secure her the empire of the world in the near future, and altho the present supply is fabulous, yet a thousand years in the life of a nation is not great, and we should mine to-day looking to the interests of the generations yet unborn and the glory yet to be realized in our beloved country. There is no paganism as fatal as that included in the policy "after us the deluge."

If then this source of power is to be conserved for the greatest possible use for the nation, some system should be devised that will eliminate the evils of free competition as well as those of crushing monopolies.

The trade of anthracite coal is in a healthful condition and will possibly continue so to the end.

The Coal Trade

The production of the anthracite collieries is at its maximum and it hardly meets the market demand. The latter continues to grow with the increase of population in the New England States, in New York, Delaware, New Jersey, and eastern Pennsylvania; but the production of the collieries will not rise to any appreciable extent, and after staying at the maximum for a time, it will decline. This puts a premium upon anthracite coal, the domestic fuel par excellence, and the future is full of promise to those who hold large areas of the tonnage still to be mined in northeastern Pennsylvania.

The bituminous trade is far from being in a like condition. Competition prevails and prices are often fatal to operators who work their mines on very small margins. The natural tendency in the competitive districts—those of the northern section of the Appalachian fields, and the eastern and western interior—is to drive out the individual operator and bring in the strong corporation. The individual cannot stand the strain of conflict, and the giants invariably agree to divide the prizes.

It is highly important that our industries and manufacturers should have cheap fuel, but it is also important that the contents of our coal-fields should be paid for, that the wear and tear in men and machinery be replaced, that the loss incident to the maiming of some 8,000 persons, and the killing of about 2,000 persons, each year, should be paid for by those who depend for their comfort in homes, and their power in shops and factories, upon the product of the mines in which these men are injured.

PETER ROBERTS.

MIR, THE (from Russian *miru*, concord, peace), is the name of the Russian community of peasants. From the most ancient times the rural population of Russia has been organized into these *mir*s. The land of the *mir* is held in common, the part of it devoted to cultivation being allotted by general vote to the several families on varying terms. Redivisions and equalizations of lots are made periodically; the portion used for dwelling portions is usually theoretically held in common, but practically divided for long periods; the land for grazing is usually undivided. Each *mir* governs itself in all local matters through its elected officers. Widows or women temporarily deprived of their husbands may vote. The land is divided with attempt at equality in proportion to the needs and abilities of each family. Adjacent *mir*s are united into *volasts* or small cantons. The system, however, is changing. (See RUSSIA.) The freeing of the serfs and division of the soil gave each too little land to enable him to live, and the lords are gradually buying or getting it back. The great difference between the *mir* and the *mark* (*q. v.*) is that the members of the *mir* had no voice in the general government. (See MARK; MANOR; PRIMITIVE PROPERTY.)

MITCHELL, JOHN: President of United Mine Workers of America; born at Braidwood, Ill., 1870. Attended, at intervals, the district school. At the age of thirteen worked in the mines; when sixteen he joined the Knights of Labor. During this period he became deeply interested in social and economic subjects and

gave much time to reading, gaining information concerning them. Prominently identified with the United Mine Workers of America shortly after the formation of the association in 1890, he was made an officer for the Illinois district. A member of the legislative committee of the Illinois miners, he assisted in securing the passage of "Gross Weight" and other important mining laws. Elected national vice-president of United Mine Workers in Jan., 1898, in September of that year he was appointed acting president. In 1899 was elected president of the mine workers, and, without opposition, has been reelected to the position every year since; is also second vice-president of the American Federation of Labor. In the great anthracite coal strike of 1902 Mr. Mitchell did splendid service to the cause of labor, and gave to the people of the United States a new conception of the real work and mission of a labor leader. (See COAL STRIKE.) Mr. Mitchell believes in independent political action by wage-workers and trade-unionists, and is a strong advocate of the management of industry through joint trade agreements. He is the author of "Organized Labor; Its Problems, Purposes, and Ideals." Address: State Life Building, Indianapolis, Ind.

MODEL VILLAGES: A term now generally applied to villages or groups of houses, more or less conveniently and attractively built and in more or less attractive surroundings, to provide housing for working people, the houses being either built by some employing firm and leased to their employees, or built by the employees themselves on land sold to them by the firm, or through the aid of some loan fund provided by the firm. The first-named system, whereby the firm owns and leases the houses on favorable terms to its employees, is much the most common system, but model villages based on very various relations between firms and their employees can be found. We give below only examples from such villages which are continually developed.

I. EUROPE

The first model village was probably that of Bessbrook, near Newry, in Ireland, built in 1846 by Messrs. Richardson for the 2,500 workers in their linen-mills. It was a great advance on the hovels of most Irish laboring folk of the day, and many social and educational features with a hall and library were introduced. It has, however, been largely neglected by the present management, the good houses of 4 rooms can yet be had there for 3s. a week, and 2-room houses for 1s. 6d. a week. The once famous Saltaire, built in 1853, on the outskirts of Bradford, by Sir Thomas Salt, for the 3,000 to 4,000 employees in his woolen-mills, is also now much neglected. Its 1,000 stone houses, built on rectangular lines, on narrow stone-paved streets without any trees, make it far below present ideals, but it, too, was a great advance for its day. A park of 14 acres adds some beauty, and houses with 3 or 4 rooms, scullery, and small back yard can be had for 3s. 6d. Very different, far more attractive, and almost ideal model villages are those at Bourneville, near Birmingham, commenced in 1879 by George Cadbury, Port Sunlight, near Birkenhead, founded by W. H. Lever in 1888, and Earswick, near York, more recently begun by Joseph Rowntree. But these are of

Great Britain

importance enough to merit special articles. (See **BOURNEVILLE**; **PORT SUNLIGHT**; **ROWNTREE**.) Other less ambitious English model villages are Street for the boot factory of the Messrs. Clark, near Glastonbury, with attractive houses with 5 rooms and a good garden for 4s. to 5s. per week, having also a fine village institute, gymnasium, library, and temperance inn. Messrs. Chivres, at Histon, near Cambridge, are doing much the same thing. The 2,000 houses of the Westinghouse Company near Manchester are much less attractive, tho with more improvements (hot and cold water, electric light, etc.), for 6s. to 9s. per week, and with library, bath, club-house, and playground. Vickerstown, opposite Barrow, built by Vickers Sons and Maxim, is even less ideal. Aintree, built by W. P. Hartley, near Liverpool, is more progressive, where small but quite attractive houses with a garden can be had for 2s. 6d. or 3s. 6d. a week. At Cedar Road, near by, also built by W. P. Hartley, small houses can be bought at 12s. 6d. a month for £100, the cost of the houses being £250 to £300.

(For English garden cities, see **GARDEN CITIES**.) On the Continent various model villages exist, notably those of the Krupp works in Germany, near Essen, but for these, see **KRUPP STEEL WORKS**. At Arlen, in Baden, Mr. Ten Brink has erected many cottages, which he sells to his employees with £10 down. The Augsburg Carding and Spinning Company have houses near their mills, with gardens and lawns. Mr. Peters, at Neviges, sells and rents to his weavers houses not themselves attractive, but at low

The Continent

rents and with gardens and fruit-trees. The North German Jute Factory at Schiffbeck lets a few hundred houses at 2 to 3 marks per week. The Badische Anilin and Sado-Fabrik, in Bavaria, in two separate villages provides some 700 families with houses at very low rentals. Messrs. Villeroy and Boch at Mettlach do the same. The United Machine Building Company of Nuremberg has 100 block houses for its 4,000 employees, and for its works at Gustafsberg, near Mayence, some 1,500 houses in 425 separate attractive dwellings, each with a garden. More interesting, however, in Germany are the housing efforts of the State, as at the Prussian State mines at Saarbrück, where toward 50 per cent of the employees, through government loans, have become owners of houses, while even more of interest are the growing number of workmen's cooperative societies, developing houses with the aid of State loans. But on both these subjects, see **HOUSING**.

In France several firms have erected large numbers of dwellings for their employees which, tho as a whole not very attractive, usually have some garden, and are rented or sold on very favorable terms. Among the firms doing this are the Anzin Mining Company, near Valenciennes (for 3,000 employees); Jules Chagot & Co., of the Planzy mines (1,000 houses); Schneider & Co., of the Creusot Steel Mills (1,200 houses); Harmel Bros., at Warmeriville, near Rheims (182 dwellings); Sainte Bros., at Flexecourt (1,000 houses). Schools and cooperative stores are also started in these villages. The best French model village, however, is Noisiel, sur Seine, begun in 1874, by Mr. Menier. (See **NOISIEL**.) Italy has an industrial model village at Crispi, near Capriate, Lombardy (mainly block houses), and one built by Mr. Achille Pazzari in Calabrina. The Humanitarian Society of Milan is, however, doing more

(see **UMANITARIA**). In Austria, Dornbirn, of the Hammerle Cotton Mills, is a very picturesque model village, with small houses among creepers, vines, and gardens of fruit-trees, let at \$25 per year or sold at \$1,000 to \$1,500. Baron Ringhofer at Prague has aided a large number of employees in his machine works at Smichof, to build, through a workmen's dwelling company, and a new attractive village is now being developed.

Holland has a small but very attractive model village, Agneta Park, in Delft, owned by a "Common Property Society," formed in 1887 by Mr. Van Marken, of the Van Marken Yeast and Spirit Works. There is a cooperative store, recreation park, and lake; the houses themselves are attractive, Mr. Marken's own house being also in the village. The tenants, instead of becoming owners of the houses, are given interest-bearing stock in the company.

II. THE UNITED STATES

While the United States as yet has produced no Bourneville nor Port Sunlight, the table accompanying this article will show that not a few American manufacturing companies have done something, at least, to provide more or less model homes in attractive and healthy surroundings for their employees.

The table does not pretend to be complete; nor does it show all that is being done in the way of housing even by the firms which are listed here. Most of the companies here named provide a wider range of houses than this table indicates. They provide, in almost all cases, houses both at higher and lower rentals than are here indicated—houses at higher rentals for foremen and expert artisans earning the higher salaries, and houses at lower rentals, perhaps with three, four, and even more families to a house, for unskilled operatives earning the smaller wages. But to include either of these in our table would be to mislead. Houses with three or four families are not ordinarily to be considered model houses, even tho they be improvements on old-time factory tenements; and high-priced houses for foremen and experts with fancy salaries would not be typical.

The first so-called "model village" in the U. S. does not appear on our list. This was Pullman, erected in 1880-84, ten miles from what was then Chicago, but is now engulfed in the city, and no longer in any sense a model village. It has passed somewhat into a byword, as a failure, because of the paternalism in it practised by the Pullman Company and resented by many of its residents. But it was by no means completely a failure and was in its day a notable step forward. Its eight miles of street, mostly sixty feet wide, all tree-planted, with lawns on either side; its 1,550 red brick two-story houses, with small gardens in front and entries behind; its open square in the center surrounded by an Italian arcade; its stores, theater, church, schools, and library, made it in many ways more of a model village than some we have tabulated on our list. Its failure was not due to financial causes.

One of the smaller model villages of the U. S. is most interesting and most important because it is one of the very few such model villages in America where the workmen mainly buy their houses, and absolutely unique in the freedom and initiative left to the workman. (This is Leclaire, Ill., commenced by Mr. N. O. Nelson (q.v.), of St.

Louis, in 1890. But for it, see especial article **LECLAIRE**. (See also **HOPDALE** for the model village developed in the place of that name out of a former Christian Socialist colony. For Ludlow, also see **LUDLOW**.)

At Whitinsville, Mass., the Whitin Machine Works Company has done quite a little for the housing of its employees. If it has not erected a model village, it is largely because Whitinsville itself may be called a model New England village.

also represents very large cotton interests and in a large share of the cases, if not in all, they provide houses." Besides these in New England should be mentioned the Plymouth Cordage Company of North Plymouth, Mass., the Peacedale Manufacturing Company of Peacedale, R. I. (interested also in profit-sharing), the Willimantic Linen Company of Willimantic, Conn., and the Cheney Brothers' silk-mills of South Manchester, Conn. This last-named place is indeed one of the

"MODEL VILLAGES" DEVELOPED BY MANUFACTURING COMPANIES IN THE UNITED STATES

| COMPANIES | Average number of stories in buildings | Number of dwellings | Rent per month | Usual number of rooms in dwellings | Average size of dwellings | Remarks |
|---|--|---------------------|----------------|------------------------------------|---------------------------|--|
| | | | Dollars | | Feet | |
| Colorado Fuel and Iron Co., Pueblo, Col. | 1 and 2 | | 8-12 | 4-6 | | |
| J. B. & J. M. Cornell Co., Cold Spring, N. Y. | 2 and attic | | 12-15 | 8-9 | 30 x 19 | Rent 5 per cent on investment |
| The Draper Co., Hopdale, Mass. | 2 | 250 | 8-12 | 6-8 | | 2-4 per cent on investment |
| Ludlow Manufacturing Co., Ludlow, Mass. | 2 | 500 | 6.75-9.50 | 4-9 | 31 x 25 | 3-5 per cent on investment Cost \$1,200-\$2,000 |
| Maryland Steel Co., Sparrows Point, Md. | 2 | 800 | 12 | 6 | 12 x 37 | |
| Nelson Valve Co., Wyndmore, Pa. | 2 | 14 | 9-16½ | 6-8 | | 7½-11 per cent on house |
| N. O. Nelson Co., St. Louis, Mo. | 1 | 100 | 10-13 | 3-6 | 26 x 33 | Lots ½ of an acre; mainly sold at \$2 to \$2.50 per front foot |
| Niagara Development Co., Niagara Falls, N. Y. | 2 | 112 | 9-37 | 4-8 | 23 x 24 | |
| Peacedale Manufacturing Co., Peacedale, R. I. | | | 8-12 | 7-8 | | |
| Pelzer Manufacturing Co., Pelzer, S. C. | Mainly 1 | 1,000 | 2 | 4 | 30 x 16 | 2½-3 per cent on investment Houses 90 feet apart |
| Plymouth Cordage Co., North Plymouth, Mass. | | | 7-9 | 8-9 | 29 x 28 | |
| S. D. Warren & Co., Westbrook, Me. | 2 | 96 | 9-12 | 5-9 | 24 x 27 | 3 per cent on investment |
| Westinghouse Air Brake Co., Wilmerding, Pa. | 2 | 360 | 14 | 5 | 25 x 30 | |
| Whitin Machine Works, Whitinsville, Mass. | 2 and 3 | 600 | | 5-8 | 24 x 30 | 4 per cent on investment |
| Willimantic Linen Co., Willimantic, Conn. | | | 5½-8 | 6 | | |

Most of the houses are of wood, modern style, with water, but with bath and other improvements only for the higher rentals. Almost all have very small gardens in front and behind, but usually are built in rows, tho not in blocks.

The company has, however, provided over 500 houses, besides an admirable boarding-house for single men. The houses are built mainly in rows, are neat, and at least an improvement on the old-time factory tenement, tho not themselves attractive artistically, and with too much sameness. Progress, however, is seen in the "New Village," showing that the company has succeeded enough in the plan to go on and improve upon it. About 3 per cent is earned on the capital invested, tho the rents average scarcely one tenth of the wages earned by heads of families in Whitinsville.

The Cumberland Mills Company of Westbrook, Me., has houses for its employees, but has not built any new tenements for over twenty years, merely keeping up and renting the old buildings at low rents, because the company finds it a better policy to loan money at 4 or 5 per cent to its permanent employees to enable them to obtain their own homes. This allows more freedom and, the company believes, produces better results.

Most of the New England cotton-mills provide some housing for their employees. Indeed, the assistant agent of the Draper Company writes that the large cotton-mills of New England located in small towns or villages almost without exception are obliged to furnish housing for their employees. He says: "The Grosvenor-Dale Company of North Grosvenor Dale, Conn., a mill with about 3,600 looms, has a large number of houses and takes much interest in this line of work. The Lonsdale Company of Providence, R. I., have cotton-mills at various places within a short distance of Providence, and in nearly all cases have provided houses. Mr. Robert Knight, of the firm of B. B. & R. Knight of Providence,

most beautiful industrial villages in the world. It seems one large park of velvet lawns, with some fourteen handsome residences of families of Cheney's, and surrounded by the houses of the employees, most of them detached cottages and each in its own garden. The Cheney's say they are not philanthropists, only they live there and like to have their homes look nice.

Outside of New England conditions are more varied. Some of the most useful industrial villages are not the most beautiful. The Pelzer Manufacturing Company in Pelzer, S. C., supply a thousand cottages for their nearly 3,000 employees, and at the low rent of \$2 per month for a cottage of four rooms, not supposed to make direct return on the capital invested. Yet are the houses of immense value to the cotton operatives of the South and the company is abundantly repaid every year from a pure business standpoint in the increased efficiency and steadiness of their employees. The company aims at "absolute industrial control coupled with a large regard for the general welfare of its employees."

The Colorado Fuel & Iron Company provide houses in their forty different mining communities, an immense advance on the rough-and-tumble private shanties of most mining-camps. They are for the most part neat and convenient, with four to six rooms. Special irrigated land is provided where the tenants can raise their own vegetables, and the company does considerably in supplying schools and social clubs.

At Gary, Ind., the U. S. Steel Company is spending millions of dollars in developing a new city with a monster steel plant, and is erecting

dwelling-houses of four to ten rooms each and two and three stories in height, for use of the employees. Philanthropy has little part in it. It is a "business proposition," a recognition that good drainage, comfort, and accessibility in workmen's homes are reflected in increased factory efficiency. Saloons and speculators are barred by clauses in the deeds, because liquor saps the energy of workmen. The company will not control the town, putting a premium on property-holding. It will have its own council, mayor, school board, political parties, and it will come as near self-government as the average American town.

MOLINARI, GUSTAVE DE: Belgian economist; born 1819 at Liège. He studied medicine in Brussels, and wrote several works on medicine. Afterward settling in Paris, he turned his attention to political science and economy. Returning to Brussels in 1852, he was made professor of political economy at the Musée Royal de l'Industrie Belge. Since 1881, however, he has lived in Paris as editor-in-chief of the *Journal des Économistes*. With his brother Eugen he founded two periodicals, the *Économiste belge* and *La bourse du travail*. Among his writings are "Questions à économie politique et du droit politique" (2 vols., 1861) et "Comment se résoudra la question sociale" (1896).

MONARCHY (from Greek *monarchia*, the rule of one) is the form of government in which the supreme power is actually or nominally lodged in the hands of one person, a king or queen. England is a monarchy, because, altho the King of England is believed by many to have less power in government than the President of the United States, and tho the governing power is in the hands of his ministers, who are subject to Parliament, all government and legislation is in the name of the king or the ruling monarch. Monarchies are classed as limited or constitutional and absolute or despotic, according as the sovereign is or is not limited in his power and functions by the laws or constitutions of the realm. More or less limited monarchies have nearly always existed. From the fifteenth to the close of the eighteenth century monarchies became almost absolute. To-day, except in Asia, absolute monarchy has all but disappeared. Monarchies are usually successive—i. e., their monarchs succeed by inheritance. There have been, however, elective monarchies, where the monarchs were elected, as formerly in Poland. The German Roman Empire was nominally elective, but for many centuries at the last the heir of the monarch was invariably elected. (For the principles involved in monarchies, see STATE.)

MONASTICISM has had large social and economic relations. It doubtless began in the East, but has entered more or less into almost all religious systems. (See ESSENES.) The founder of Christian monasticism is generally believed to be St. Anthony. At first the personal seclusion of individuals was deemed essential, but the isolation became less and less. By degrees the monastery became the school for practical, philanthropic, and social Christian life. The monks

divided their time between manual labor and their devotions, giving to the poor the surplus product of their work. Cloisters for females began to be established. In the eighth century a kind of a middle order between monks and clergy was formed. Most of these had a common house and table; and some branches renounced all their possessions and claimed no private property. Some orders kept schools, and some nursed the sick. In the first part of the thirteenth century the two mendicant orders arose—the Franciscans and Dominicans, the former especially, with its vows of poverty, after the example of its great founder, St. Francis of Assisi, developing great unworldliness and bringing to the lowly great spirituality and practical help. This, however, gradually changed and it was by these two orders that monachism was raised to the height of its power, influence, and prosperity. The poorer members wandered over Europe, instructing the people and attracting general admiration for their sanctity and self-denial. Their advice was eagerly sought in secular and political affairs. They became elevated to college professorships. At last their great influence drew upon them the hostility of the clergy, and their vast riches and prosperity brought about the envy of the nobility, and the ultimate degeneracy and downfall of the monks themselves. Again and again reforms were inaugurated only to be overwhelmed by the growing tide of self-indulgence. Laxity was followed by lust, ownership by avarice, liberality by ungodliness, and honest industry by every manner of corruption. This continued until the general confiscation of their lands and abolition of their privileges, when in a few years no less than 3,000 monasteries were broken up in Europe.

Altho the Reformation rejected monachism, several types of it have been and are still found in Protestantism. In Germany both Lutherans and Evangelicals have formed houses of deacons and deaconesses for the purpose of teaching, healing the sick, visiting prisoners, etc. In the Church of England and the Protestant Episcopal Church of this country various brotherhoods and sisterhoods have been formed at various times, and have recently been somewhat multiplied, imitating to some extent medieval monastic associations with some modern features. Monastic orders, however, have endured and done large work for education and for charity, tho they are opposed to-day and have been or are being driven out of most Roman Catholic countries on the ground of agitating and plotting against the State in its efforts at secular education and democratic government. In connection with the American Roman Catholic Church, there are over 300 nunneries and 128 monasteries. C.

MONEY (see CURRENCY for a historical sketch of United States currency, and BANKS AND BANKING; BIMETALISM; CONTRACTION AND EXPANSION OF CURRENCY; FINANCE; GREENBACK PARTY; GOLD AND SILVER; PAPER MONEY, for especial topics): In this article we treat of money in general, describing the economic nature and function of money, with a sketch of the history of money.

To define the word money is both easy and difficult. It is not difficult to define it in almost any one of two or three meanings; but the trouble is that the word is used, and even by writers of repute, in more senses than one, and

these various senses are so various that no definition can be made to cover them all. It will be necessary, therefore, to give at least three distinct definitions.

1. Money is sometimes used, altho with the least authority, to mean gold and silver or other metal currency, in contradistinction from paper currency. This use is uncommon, and almost never found in economic writings, but is sometimes met with in popular speech.

2. By money is sometimes meant whatever the law declares to be "legal tender" in exchange or in payment of debt. "Legal tender" is that which the law compels a person to receive in payment of debt. This is money in its narrowest sense. It has the "fiat" of government upon it—i.e., government declares or "makes it" to be money. Any man can offer such money to his creditor and compel him to take it at its face value; if the creditor refuse, the debtor is no longer legally liable for the debt. This is the legal sense, and a frequent sense of the word in political economy; but usually, for the sake of clearness, the phrase "legal tender" is used for such money.

3. Money is ordinarily used in political economy to mean any article ordinarily in use as a medium of exchange. It has been said that in this sense "Money is that money does" (Walker). To give a more exact definition, we may use Mr. Walker's, which has been widely adopted:

"Money is that which passes freely from hand to hand throughout the community in final discharge of debts and full payment for commodities, being accepted equally without reference to the character or credit of the person who offers it, and without the intention of the person who receives it to consume it or enjoy it, or apply it to any other use than, in turn, to tender it to others in discharge of debts or full payment for commodities" ("Money, Trade and Industry," p. 4).

FUNCTIONS OF MONEY

The first function of money is to be a medium of exchange. When our earliest ancestors desired to exchange any goods, they did it by direct barter or exchange of goods.

The operation is also called truck (French, *trac*, barter). Among uncivilized races trade is still carried on in this way; a traveler going into the interior of South Africa takes a stock of beads, knives, pieces of iron, looking-glasses, etc., in order that he may always have something which the natives will like to receive in exchange for food or services. People still occasionally barter things in England or the United States, but this is seldom done, owing to the trouble which it gives.

These difficulties have early caused all races at all civilized to adopt some one article as a common medium of exchange or money. Thus, money being exchangeable by custom, or by law if it be legal tender, a man who has any article to sell sells it for money to anybody who will buy it, not having to seek an article in exchange, because, having got the money, he can go and buy whatever article he himself wants from any person who has the article he desires. Thus money fulfils its first function of being a medium of exchange.

A second function hardly inferior in importance to the one just mentioned is that of affording a ready means of estimating the comparative value of different commodities. Indeed, it may

be reasonably maintained that the idea of general value could not be formed without the existence of money. The adoption of some one commodity renders the comparison of values easy. "The chosen commodity becomes a common denominator or common measure of value in terms of which we estimate the values of all other goods" (Jevons).

A third function of money soon develops itself. Commerce cannot advance far before people begin to borrow and lend, and debts of various origin are contracted. One of the most distinctive features of advancing civilization is the increasing tendency of people to trust each other. Now a contract implies something to be done in the future, and for estimating the value of that future act a standard is required; and money, which already acts as a medium of exchange and as a measure of value at a given time, performs a third function by affording an approximate means of estimating the value of the future act, and in this respect may be regarded as a standard of value, or, as it is sometimes said, of deferred payments.

As we shall see later, this is one of the most important uses of money; but now we pass on. Money sometimes also serves a fourth purpose—that of embodying value in a convenient form for conveyance to distant places. Something which is very valuable, altho of little bulk and weight, and which will be recognized as very valuable in every part of the world, is necessary for this purpose. The current money of a country is perhaps more likely to fulfil these conditions than anything else, altho diamonds and other precious stones and articles of exceptional beauty and rarity might be employed.

Such are the main economic functions that money is designed to fulfil.

We pass on to consider what are the qualities that should characterize the commodity we adopt as money. The first quality needed is general acceptability. Money cannot

Qualities of Good Money

discharge its prime function unless everybody, or almost everybody, is willing to accept it. This general acceptability can, however, be secured to a great extent by means of a law making any kind of commodity legal tender—i. e., requiring all who are subject to the law to accept it as a full and final discharge of obligations. If, however, the government chooses an unsuitable commodity, the law will be evaded and barter will be resorted to.

The second quality which it is desirable that money should possess is durability, and that without deterioration. Cattle and wheat are used as money by some savage tribes, but both of these lack this quality. Gold and jewels possess it in a high degree.

The third of the desirable qualities is portability. Cattle are good in this respect, as they carry themselves. Wheat is bad, as its value compared to its bulk is low. Gold is good; but from this point of view diamonds would be still better.

The fourth and fifth of the desirable qualities are divisibility and uniformity. Under the latter we may include that the quality is easily defined. Hitherto jewels have seemed even more suitable than gold for money, but they do not fulfil these requirements. Their value is not easily tested or attested; and to divide them is difficult and destructive of their value. Metals, on the other

hand, are easily coined in any degree of purity. The stamp, edges, etc., serve to prevent wilful mutilation, and as gold and silver possess also the qualities of durability and portability in a high degree, they have, very largely, been adopted as money.

There is, however, a sixth quality very desirable in money, which gold and silver do not possess to anything like the extent that could be wished. This quality may be described as steadiness of value. We have seen that money is generally used as a standard of deferred payments. Now, if the delays in payment were always brief, gold and silver would admirably fulfil this purpose. A hundredweight of gold will exchange to-day for about the same quantity of most other commodities as it would have done six months ago. But if the interval is a long one the fluctuations in the exchange value of gold are very serious.

How this evil can be best remedied is to-day the most discuss monetary question. (See *CONTRACTION AND EXPANSION OF CURRENCY; BIMETALISM.*) We pass on to notice one more desirable quality in money which is what Jevons calls cognizability. He says:

By this name we may denote the capability of a substance for being easily recognized and distinguished from all other substances. As a medium of exchange, money has to be continually handed about, and it will occasion great trouble if every person receiving currency has to scrutinize, weigh, and test it. If it requires any skill to discriminate good money from bad, poor ignorant people are sure to be imposed upon. Hence the medium of exchange should have certain distinct marks which nobody can mistake. Precious stones, even if in other respects good as money, could not be so used, because only a skilled lapidary can surely distinguish between true and imitation gems.

Under cognizability we may properly include what has been aptly called impressibility, namely, the capability of a substance to receive such an impression, seal, or design as shall establish its character as current money of certain value.

We may now consider some of the general principles which govern the use of money, confining our attention to those which apply to all money. (For a discussion of fiat, paper, or representative money, see *PAPER MONEY.*)

The first principle is that the supreme quality in money is that it should express a standard of value which will not vary. But value (*q. v.*)

Standard of Value

merely expresses the exchange ratio between commodities, and this is always more or less changing. It is impossible, therefore, to get a standard which will never change, and the best that can be done is to approximate this. Which money does this best is disputed; some think it is gold; others gold and silver used together; others paper money issued in certain quantities. (For these various views, see *BIMETALISM; PAPER MONEY.*)

Secondly, we must recognize the force of habit in using particular forms of money and having confidence in it. Jevons says on this point:

"No one can possibly understand many social phenomena unless he constantly bears in mind the force of habit and social convention. This is strikingly true in our subject of money. Over and over again powerful rulers have endeavored to put new coins into circulation or withdraw old ones, but the instincts of self-interest or habit in the people have been too strong for laws and penalties."

The third principle that we most notice and one of the most important is the so-called Gresh-

am's Law (from Sir Thomas Gresham, who lived in England in the Elizabethan period). This law asserts that when two or more kinds of legal money contend for use in the market, the worst kind of money that is legal will drive the better kinds out of circulation. The reason is simple. When a person pays out any money he inclines to get rid of the worst money he has with which he can legally settle the account. He keeps the best money himself. Consequently the worst money circulates the most and the best is hoarded or driven out of circulation. Hence the necessity of keeping all the money in circulation at par, unless a nation is willing to go to the exclusive use of the worst money.

A fourth principle, and perhaps in modern times the most important of all, is that the quantity of money should be commensurate with the demand for a medium of exchange, because if the amount of money in a country is not increased in proportion to the demand for it, it will rise in value, and thus become a variable standard. Hence the money that is most invariable in value will be that which varies in quantity most exactly in conformity with the demand for it. Hence a currency inelastic in quantity may be the most dishonest money, and a currency elastic in quantity may be made the most honest.

An elastic currency, however, may also be made dishonest. It depends wholly on how it is varied in quantity. So far as quantity is concerned it should vary exactly with the demand, thus, so far as quantity is concerned, being perfectly stable in value. An elastic currency, therefore, at least permits of stability of value; an inelastic currency cannot be honest unless there is no change either in the population of a country or in the use that population has for money. It is not enough merely for a circulation to expand with population, but must expand or contract with the use the population has for money. If a civilization grows more intricate and involved, there are ordinarily more cash transactions, and therefore there is more demand for money. The grave and important questions that arise out of variations in the amount of money are well known. A currency increasing in volume out of proportion to the demand robs creditors, a diminishing currency robs debtors. (See *CONTRACTION AND EXPANSION OF CURRENCY; BIMETALISM; PAPER MONEY; SILVER.*)

HISTORY OF MONEY

The first money used seems to have been furs and skins. The next stage of society was pastoral, and the corresponding money was cattle or some domesticated animal. The word *pecunia* (Latin for money), whence our word pecuniary, is probably derived from *pecus*, cattle. In uncivilized portions of the world cattle are still used to express value. A wife, a slave, etc., are still said to be worth so many head of cattle. More advanced communities used articles of ornament, such as shells, like the wampumpeag of the North American Indians, or the ring money of many countries. Agricultural or other natural products were used. Tobacco was commonly used for money in the North American colonies; cod-fish were used in Newfoundland; cubes of pressed tea in Tartary; sugar in the West Indies. The next stage was the use of various manufactured articles, such as a preparation of leather by the

Carthaginians, silk by the Chinese, nails in Scotland, bullets and wampum in Massachusetts.

Metals, however, have been mainly used except in the earliest times. Of metals almost every kind has been used—iron, lead, tin, platinum, nickel, copper, and, above all, silver and gold. Iron has been used until very recently in Japan for small values. In the Homeric age it is said to have been more valued than copper. Tin was probably early used; the first known instance being by Dionysius of Syracuse. It is thought to have formed the first English coinage. It has been used in Mexico and in Java. Roman emperors and English kings struck tin coins. Tin farthings were issued in England as late as 1690. Lead is still more soft, but has been largely employed. It was used in the form of bullets in Massachusetts. Platinum has been used in Russia. It is one of the rarer metals, but very difficult and costly to melt. Nickel is used solely as convenient in making alloys. Copper was one of the first known metals, and is still in use for minor coins everywhere. The earliest Hebrew coins are thought to have been copper, and the metallic currency of Rome down to 269 B.C. was an impure copper or *as*. It formed the main money of Russia and Sweden in the last century. It is, however, too cheap to have much intrinsic value.

Silver has been the main metal for coinage in historical times. Abraham (Gen. xxiii: 16) is said to have paid out shekels of silver, tho this was a weight of silver, not coin. Herodotus attributes the first use of coined gold and silver to the Lydians, tho he also says that the first Greek coinage was made by Pheidon of Argos at *Ægina* (895 B.C.). Metal first passed everywhere by weight, a system said to have been of Assyrio-Babylonian origin. Only later did governments stamp on coins an indication of their weight, fineness, and resultant value—the hall mark as Jevons calls it.

The shape was at first varied—square, hexagonal, octagonal, or round; only later did the round form, and still later the milled edge, prevail to prevent clipping and unconscious loss.

After the fall of the Roman Empire various silver coins were used. Charlemagne undertook to introduce a general system of money based on the silver pound, known in England as the troy pound of 12 oz., but the breaking up of his empire prevented this general use. It passed, however, into England, and the pound was divided into 240 pence (*denarii*), twelve of which constituted a shilling (*solidus*). Twenty shillings thus represented a silver pound. Hence the name "pound." The first English gold coin seems to have been that of Henry III. in 1257, when a number of gold pennies were coined at a value to silver of 10 to 1. The first regular series of gold coinage in England, however, dates from 1344, under Edward III. In France, after the breaking of the empire of Charlemagne, 150 powers are said to have issued money. Debasement of money became the rule in France. The first debasement of coinage established in history is when Solon (599 B.C.) debased the quantity of silver in the Athenian coins over 25 per cent. Professor Bastable, in an article in the "Encyclopædia Britannica," thinks it to have been successful, and probably necessary. It was probably not the only Greek debasement, and in Roman history debasement of the coinage was frequent.

Debasements

The first debasement in English history was in 1300, when Edward I. slightly debased the silver coinage. The practise, however, became common, especially from 1543–52, under Henry VIII. and Edward VI. It wholly ceased, however, after the sixteenth century. Scotch coins were much more debased than English. In France, debasements did not stop with the sixteenth century.

These depreciations point to the very variable value of metallic money. Allison, in his "History of Europe," says:

"The two greatest events in the history of mankind have been brought about by a successive contraction and expansion in the circulating medium of society. The fall of the Roman Empire, so long ascribed in ignorance to slavery, to heathenism, and moral corruption, was in reality brought about by a decline in the silver and gold mines of Spain and Greece. . . . The annual supply of the precious metals—of money—for the use of the globe was tripled; before a century had elapsed the price of every species of produce was quadrupled. The weight of debt and taxation insensibly wore off under the influence of that prodigious increase; in the renovation of industry, the relations of society were changed, the weight of feudalism cast off, the rights of man established.

This is, however, undoubtedly an extreme view. The corruption of the Roman Empire and the incursion of hordes of uncorrupted Germanic tribes cannot be lightly shuffled off as causes of the fall of Rome, nor can the new life of the sixteenth century be so largely attributed to the influx of gold and silver from the mines and treasures of Mexico and Peru. A hundred causes, political, intellectual, religious, and social, led to the new activity of the modern age. Feudalism in England at least was shuffled off before the gold and silver came. The rights of man were not even much preached till long after the discovery of America. Yet undoubtedly the scarcity of money in the Middle Ages and the influx of gold and silver from the New World were potent factors in the history of mankind.

Through the Middle Ages the supply of gold and silver was limited. The report of the U. S. Monetary Commission says:

"At the Christian era the metallic money of the Roman Empire amounted to \$1,800,000,000. By the end of the fifteenth century it had shrunk to less than \$200,000,000."

William Jacob, F.R.S., gives the following table of the amount of metallic money:

| | |
|---------------|-----------------|
| A.D. 14..... | \$1,790,000,000 |
| A.D. 230..... | 909,000,000 |
| A.D. 210..... | 537,000,000 |
| A.D. 662..... | 250,000,000 |
| A.D. 806..... | 168,000,000 |

All such tables are more or less conjectural, however; the only fact that is generally accepted being that during the Dark Ages mines were little worked. About 800 A.D. the Moors in Spain began to rework her mines, and are supposed from that date to have counteracted the loss by wear and exportation, and accordingly we may regard the metallic supply as fixt in amount until the next change in the conditions of production, which was the result of the discovery of America. The conquest of Mexico (1519) gave opportunities of working the silver mines of that country, while the first mines of Chile and Peru were almost simultaneously discovered, and in 1545 those of Potosi were laid open. From this latter date we may regard the American supply as an influential factor in the matter, and look upon the stock of money as increasing. The annual addition to the store of money has been estimated as £2,100,000 for the

period from 1545-1600. At this date the Brazilian supply began.

At the commencement of this century the annual production of gold has been estimated as being from £2,500,000 to £3,000,000. The year 1809 seems to mark an epoch in the production of these metals, since the outbreak of the revolts of the various Spanish dependencies in South America tended to check the usual supply from those countries, and a marked increase in the value of money was the consequence. During the period 1809-49 the value of gold and silver rose to about two times and a half their former level, notwithstanding fresh discoveries in Asiatic Russia. The annual yield in 1849 was estimated at £8,000,000. The next important date for our present purpose is the year 1848, when the Californian mines were opened, while in 1851 the Australian discoveries took place. By these events an enormous mass of gold was added to the world's supply. The most careful estimates fix the addition during the years 1851-71 at £500,000,000, or an amount nearly equal to the former stock in existence.

It is from these variations in the quantity, and therefore in the value of money, that the modern history of money takes its rise. The various coins of uncertain value in the Middle Ages, many of them depreciated by governments, by private money-clippers, or by use, gave occasion to the custom in Venice, Genoa, and

Modern Times

perhaps elsewhere, of placing them in so-called banks, having them carefully valued by experts, and the depositors receiving various receipts for the same, which receipts circulated as money, often with a premium above coin, and often enduring even long after the coin deposited in the banks had been seized by ruthless kings or dishonest speculators. In this custom probably lies the beginning of paper money, which henceforth plays so large a part in the history of money, and for an account of which, see articles PAPER MONEY; BANKS AND BANKING; BANK OF VENICE, etc.

Again, in the experience of England with depreciations of currency and in the fall of money values occasioned by the influx of gold and silver when the New World was discovered, is the occasion for the comparatively early commitment of England to the doctrine of gold monometallism (*q. v.*), which has led to the greatest monetary changes and monetary conflicts of modern times. Up to the year 1819 almost all nations, as we have seen, issued coins of both gold and silver, as well as of other metals, and tried to regulate their relative values by royal or governmental proclamations. Altho supply and demand continually tended to change the relative value of the two metals, and altho from about 1760-1810 enormous quantities of silver poured into the world from mines in Mexico and elsewhere (so that in 1800 the world's annual silver product was nearly three times its product in 1700), the actual alteration in the relative values aforesaid was but slight. In 1803, therefore, France adopted her famous law making fifteen parts and a half of silver equal to one part of gold in all transactions. England, however, in 1816, under the second Lord Liverpool, took an opposite course, and demonetized silver as a standard.

From this time on the history of money becomes the history of the bimetallic controversy, for which we refer our readers to the article

BIMETALLISM; also see PAPER MONEY. (For the history of money in the U. S., see CURRENCY.)

Fonda, *Honest Money* (1893); J. S. Nicholson, *A Treatise on Money* (1901); H. White, *Money and Banking* (1902). See also BIMETALLISM.

MONEY, L. G. CHIOZZA: Member British Parliament, and publicist; born, 1870, at Genoa, Italy; son of an English mother and Anglo-Italian father; an aunt gave him the name Money. He has long lived in London. He was left a full orphan at the age of fifteen, and has had to shift for himself since. Nevertheless, he gained a good education, was elected a member of the Royal Statistical Society, and became prominent in that body through the suggestion to revise the Board of Trade returns in 1902. In 1906 he was elected to Parliament as a Liberal member for North Paddington, but continues his Socialistic activity. He is author of "Riches and Poverty"; "Through Preference to Protection"; "Elements of the Fiscal Problem"; "British Trade and the Zollverein Issue." Address: Chaldon, Surrey, England.

MONOPOLIES. See TRUSTS.

MONTEFIORE, SIR MOSES HAYYIM: Philanthropist; born 1784 at Leghorn, Italy, as the son of Anglo-Italian parents. He was educated in London, and became a member of the stock exchange. He succeeded in his business and banking affairs and retired in 1824 after having made a large fortune. From that time on he devoted his life to the amelioration of the Jewish race, particularly to the removal of their civil disabilities in England. He was personally so well liked that he was elected High Sheriff of Kent, and Sheriff of London in 1837. He was knighted the same year, and made a baronet in 1846. Between 1827 and 1875 he made seven journeys to the Orient in order to find out what could be done for his coreligionists, but accomplished little in a political way, altho personally he was received with the greatest respect. In 1865 he founded a Jewish college at Ramsgate, where he spent the later years of his life, and died July 28, 1885.

REFERENCES: See works by Israel Davis and Lucien Wolf on *Sir Moses Montefiore*, London, 1884.

MONTESQUIEU, CHARLES LOUIS DE SECONDAT, BARON DE: Philosopher and political economist; born near Bordeaux, France, 1689; educated at the oratorian college of Juilly and the Academy of Bordeaux. During his studies at Bordeaux he entered the Council of Bordeaux, and in 1716 became its president. Under the influence of Newton he interested himself in natural science. In 1721 he produced the "Lettres Persanes," a satire by a supposed Persian traveler in France on French society. In 1725 the "Temple de Gnide," an allegorical prose poem; was now elected to the Academy, but did not take his seat till 1728; traveled in Germany and Italy, and spent two years in England studying social institutions; wrote several minor political works preparatory to his masterpiece, "L'Esprit des Loix" (1748). Its character is indicated by its full title: "On the Spirit of Laws; or, the Necessary Relations Between a Country's Laws and the Nature of its Government, its Manners, Climate, Religion, Commerce,"

etc. It was received with great enthusiasm, and ran through twenty-two editions in a year and a half. To the objections it called forth Montesquieu replied in his "Défense de l'Esprit des Lois" (1750). Montesquieu died in 1755. (For his main teachings, see **POLITICAL SCIENCE**.)

MONTES DE PIETÉ (from It. *monte di pietà*, fund of pity): Institutions established by public authority for lending money at moderate rates on the security of goods. They originated in Italy in the fifteenth century to counteract the usurious practices of the Jewish money-lenders. (See **PAWN-SHOPS**.)

MORAL ELEMENT IN SOCIAL REFORM, THE: Perhaps no characteristic of the present efforts for social reform is more hopeful and more important than the deepening emphasis now placed—however far we may yet be from placing all the emphasis we ought—on the moral element in social reform. A hundred years ago the key-word in social reform was "natural rights," and in economics "*laissez-faire*." To-day the key-word in reform is "cooperation," and in economics "character." If this may seem to some too optimistic a view, we remind them that individualist, Socialist, and even anarchist reformers all seek cooperation, while in economics the reason why individualist economists fear socialism is that they believe that it will deteriorate character, and the reason why Socialist economists seek socialism is their belief that under individualism character is deteriorating. Undoubtedly there are also evil signs to-day. Many Socialist reformers come perilously near to an unethical materialism, and many individualist economists approach a cynical belief that the only thing which can be counted on to dominate activity is a material self-interest. Doubtless, too, it is possible to minimize the moral element which existed 100 years ago. If the doctrine of "natural rights" (*q. v.*) produced the French and perhaps the American Revolution, it was often striven for with a devotion and sacrifice of the most ethical kind. Of the economics of Adam Smith, Arnold Toynbee, who criticizes them, says ("Industrial Revolution"):

Two conceptions are woven into every argument of the "Wealth of Nations," the belief in the supremacy of individual liberty and the conviction that man's self-love is God's providence, so that the individual, in pursuit of his own interest, is promoting the interest of all.

Nevertheless, neither ignoring our own deficiencies nor minimizing the moral element of the past, it must be recognized that economics have been considerably moralized within the century, particularly in England, and that the present wide-spread effort for social reform upon all lines indicates in itself a deepening and a widening of the moral impulse. Under the old political economy, especially with the successors of Adam Smith rather than with Adam Smith himself, men, as Bagehot (*q. v.*) shows, were conceived as simply "economic men," "money-making animals." To-day political economy, particularly of the psychologic school and to a less extent of the historical school, considers man in his full, round nature. Again, the aim of the old political economy was the wealth of nations considered mainly from the standpoint of material production. To-day po-

litical economy gives at least a considerably increased attention to the problems of distribution, and to the good of the working classes. It has become far less of a pure science and much more of a practical art. This change is largely due to Mill, or, at least, becomes first prominent in his work. In the introduction to his "Political Economy" (1848) he says:

The design of the book is different from that of any treatise on political economy which has been produced in England since the work of Adam Smith.

The most characteristic quality of that work, and the one in which it most differs from some others which have equalled and even surpassed it as mere expositions of the general principles of the subject, is that it invariably associates the principles with their applications. This of itself implies a much wider range of ideas and of topics than are included in political economy, considered as a branch of abstract speculation. For practical purposes, political economy is inseparably intertwined with many other branches of social philosophy. Except in matters of mere detail, there are perhaps no practical questions, even among those which approach nearest to the character of purely economical questions, which admit of being decided on economical premises alone. And it is because Adam Smith never loses sight of this truth; because, in his applications of political economy, he perpetually appeals to other and often far larger considerations than pure political economy affords, that he gives the well-grounded feeling of command over the principles of the subject for purposes of practise, owing to which the "Wealth of Nations" alone among treatises on political economy, has not only been popular with general readers, but has imposed itself strongly on the minds of men of the world and of legislators.

It appears to the present writer that a work similar in its object and general conception to that of Adam Smith, but adapted to the more extended knowledge and improved ideas of the present age, is the kind of contribution which political economy at present requires.

Since Mill, political economy has steadily grown "moral." Professor Ely divides the evolution of political economy into three periods. He says ("Introduction to Political Economy," pp. 105, 106):

"Economic goods are first made the primary thing, and they are treated almost as if their production was an independent process apart from the will of man, one extreme writer going so far as to say that the laws governing the production of wealth would be just what they are if man did not exist. The social relations involved in the production and consumption of economic goods are then considered more carefully, and finally the original process is reversed, and it is distinctly asserted that 'the starting-point as well as the object-point of our science is man' (Roscher's 'Political Economy,' vol. i. of Lalor's translation, p. 52).

"The definition of political economy found in Mrs. Fawcett's little 'Political Economy' may be taken as a fair presentation of the first class of conceptions. It is as follows: 'Political economy is the science which investigates the nature of wealth and the laws which govern its production, exchange, and distribution.'

"The definition of political economy found in John Stuart Mill's treatise may be taken as a tolerably accurate presentation of the second class of conceptions. 'Writers on political economy,' says Mill, 'profess to teach or investigate the nature of wealth and the laws of its production and distribution, including directly or remotely the operation of all the causes by which the condition of mankind or of any society of human beings in respect to this universal object of human desire is made prosperous or the reverse.' Social relations are dragged in through a back door, as it were." As an illustration of the third period, Professor Ely quotes Prof. Henry C. Adams, of the University of Michigan, as saying of political economy, in his "Outlines of Lectures upon Political Economy," that it "treats of industrial society. Its purpose as an analytic science is to explain the industrial actions of men. Its purpose as a constructive science is to discover a scientific and rational basis for the formation and government of industrial society."

The present moral danger of modern political economy is overanalysis. Says Dr. Edward Caird ("The Moral Aspect of the Economical Problem," a presidential address to the Ethical Society):

It is the peculiar temptation of students of science and literature to cultivate a so-called critical spirit—a consciousness of scientific law, that has no tolerance for any form of

zeal which is not quite according to knowledge or a literary sense, the delicacy and quickness of which is easily turned into faultfinding and intolerance of every thought and feeling which does not express itself in conformity with its own standards. The devil of these modern days is not, as Goethe said, the northern phantom with horns and hoofs, not the spirit which inspires a rabid witch-like frenzy for evil, that mocks the sacred enthusiasm for good; it is the spirit which always denies, which sees nothing but pretense in virtue, nothing but illusion in the higher hopes and faiths of man. This chilling doubt is the shadow that accompanies our advancing knowledge, sometimes taking away the good of it, and making us almost wish for the simpler faiths and unhesitating instincts of an earlier time. . . . It is this that turns science aside into the way of a false realistic analysis, which "has the parts in its hand, but has lost all consciousness of the spiritual bond which united them." It is this which reduces life to its crude elements, and then doubts whether it is worth living; it is this finally that so fills us with the sense of the difficulties and disadvantages of every step to improve the condition of man, that we shrink into isolation and inaction. . . .

This is the devil which is most dangerous to the soul that has been swept and garnished by culture, and which that soul must repel if it would save itself from growing weakness and moral decay. As a class, men of culture are not much in danger of being possessed by a frantic love of evil and hatred of good, but sometimes they are in danger of losing a belief in the greatness of the issues of existence which are hid under its littleness, and in the worth of every human life, in spite of the triviality and meanness of its appearance.

But more than to any advance in academic political economy is the present indebted to the great moral reformers, like Carlyle, Ruskin,

Reformers their position and contributions to social reform, see their respective names; but it is to Ruskin, more than to any other modern reformer, we owe the conceptions that wealth is well living; that the life is more than meat; that man should own property and not property own man. It is to Carlyle that we owe an exaltation of the possibility of man, and the assertion of manhood over social and economic shams. It is to Maurice that the Church of to-day mainly owes her Christian Socialism. It is Mazzini who, more strongly than any, has emphasized duty as greater than rights, and God as above materialism. Tolstoy, more than any other, has taught individualists the greatness of sacrifice. (For a consideration, however, of the moral element in social reform, so far as it has taken the form of Christian thought and effort, see **CHRISTIAN SOCIALISM; CHURCH AND SOCIAL REFORM.**) Outside of the Church the deepest contribution to the moralization of reform, except from individuals like the above, has come from the positivist school and from the modern ethical movement.

Said Frederic Harrison (*q. v.*) ("Address on Moral and Religious Socialism," Jan. 1, 1891), the central social maxim of positivism is "to make political interests give way to moral duties." Its aim is a religion of humanity, the service of man. As for the various societies of ethical culture in America and Europe, their avowed object is "the elevation of the moral life of its members and that of the community," and everywhere its societies are calling attention to the moral side of social reforms.

It must be remembered that our subject is the moral element in social reform. It is questioned by some if society is growing moral. (See **CRIME.**) Says J. M. Whiton ("The Reaction of Ethics upon Economics," address at Yale College, June, 1888):

We are now threatened with moral chaos in the world of trade, as the natural result of that Lucretian vortex of atoms, out of which Smith and his disciples imagined an economic cosmos would come. So dispassionate an observer as Prof. H. Sidgwick, of Cambridge, criticises "the antisocial temper

and attitude of mind produced by the continual struggle of competition," and inquires "whether the whole individualistic organization of industry, whatever its material advantages be, is not open to condemnation as radically demoralizing." The question is answered by Professor Graham, of Belfast: "Our practical working ethics, as distinct from the ethics of the schools, often grand enough, is narrowed to the lowest egoism and the coarsest moral materialism."

These old questions, newly moved by authorities whom it is folly to disparage, we see seconded on every hand by spectacles which stir the common mind to thinking on the problems thus proposed; as by heightening contrasts between the neighbors Opulence and Indigence, by the purchase of ground for a ten-million-dollar cathedral in honor of Christ, while the slums, where Christ's little ones die in noisome heat by thousands, remain undisturbed, and even lucrative at 35 per cent. . . .

Our political seers, also, have heard the surf through the fog and are crying from their lookout, "Breakers ahead." "Nowhere in the world," says our Professor Sumner, "is the danger of a plutocracy as formidable as it is here. . . . Already the question presents itself as one of life or death to democracy. . . . The task before us is one which calls for fresh reserves of moral force and political virtue from the very foundations of the social body."

Nevertheless, the very recognition of these evils and the effort to meet them indicate an advance. Even our wealthy men, who sneer at social reform, are compelled, as never before, to practise a "gospel of wealth"; and it is among the best signs of the times that never, as now, was philanthropy so criticized for giving to the poor only what it has first taken from the poor, bestowing on universities and charities that which it gathered by avarice and perhaps by fraud.

We are developing, as Mr. H. D. Lloyd (*q. v.*) has asserted, "a new conscience." Long ago Mazzini wrote: "Every political question is becoming a social question, and every social question is rapidly becoming a religious question." Matthew Arnold defines civilization as "the humanizing, the bringing into one harmonious and truly humane life of the whole body of society." If this is not true of civilization to-day, it is at least the present aim and endeavor of social reform.

MORAVIANS: The Moravian Church, or Church of the United Brethren, the *Unitas Fratrum*, originated in the reformation of John Huss in Bohemia and Moravia in the fifteenth century. Almost crushed out by persecution, it was revived in 1722 at Herrnhut by Count Zinzendorf, and the policy was adopted of propagating its faith by forming missionary semi-communal colonies, which by a quiet fraternal life, joined to a pietistic faith, should influence the world. Since 1732 more than 2,200 missionaries have gone out. These communities celebrated love feasts (*agapæ, q. v.*), and in every way developed the fraternal spirit. Since 1856 these fraternal customs have, however, disappeared from Moravian settlements in the United States, about half those in the world.

MORE, SIR THOMAS: Statesman; born London, 1478; became at the age of fifteen page in the household of Cardinal Morton, Archbishop of Canterbury, and Prime Minister. In 1497 entered Oxford University, and afterward studied law at Lincoln's Inn, London, and resided for some years at a Gray Friars monastery. In 1502 he became a judge in the sheriff's court, and also

member of Parliament for Middlesex. Sir James Mackintosh says of him that "he is the first person in our [English] history distinguished by the faculty of public speaking, and is remarkable for the successful employment of it in Parliament against a lavish grant of money to the crown." The occasion referred to was when he persuaded the House of Commons not to grant a supply to Henry VII. on the marriage of his daughter. About 1514 he wrote his famous "Utopia," which was printed in Louvain (1516) under the editorship of his friend Erasmus, and was soon translated into many languages. In 1521 More was knighted and appointed treasurer of the exchequer; in 1523, speaker of the House of Commons. In 1529 he was appointed lord-chancellor in place of Cardinal Wolsey. Having declined to take the oath by which he was required to recognize the validity of the marriage of Anne Boleyn, he was consigned to the Tower of London in 1534. After he had been in prison for a year he was charged with treason in that he denied the king's supremacy as head of the Church, and finally was condemned and beheaded on July 6, 1535. All the accounts we have of Sir Thomas More's life agree in describing him as of unusual greatness, pure-minded, just, and generous, with an inexhaustible flow of sprightly wit; and tho as a statesman bound by his surroundings, yet able to see clearly the evils of despotism and monarchy, and in heart, as is shown in his "Utopia," a democratic republican. In this book More first introduces his readers to a traveler and philosopher whom he meets in Antwerp, just returned from journeyings in strange lands; he had started out with Vespucci on his last voyage, but leaving him at the farthest point had pushed on to other strange lands, and finally to the island of Utopia, whose laws and customs impress him greatly, and which he relates at length to More. The descriptions show a very keen perception of the causes of misgovernment, while the sentiments put into the mouth of the traveler when he is discussing English institutions show that Sir Thomas More was at heart, at all events, a pronounced republican, and one who loved his fellow men rather than institutions. In Utopia all save the old and infirm are expected to labor six hours a day; all goods of every kind are owned in common; and the people choose their houses every ten years by lot, and dine together in large halls. They have no money of any kind, and consider gold and silver as the basest of metals, fit only for ignoble uses. All personal adornment they consider as childish and degrading. Their priests are few in number, but are universally revered for their sanctity and their courage in time of war. There are two religious orders among them, very similar to the Order of St. Francis of Assisi; their endeavor is to purify their souls by engaging in the lowliest and most unattractive labors. Religious intolerance is a thing unknown, as it is the doctrine of the Utopians that belief is largely a matter of environment and birth. There are twenty-four cities in Utopia, equal in extent. The government is largely directed by a council composed of three wise men from each city, who are elected by their fellow citizens. The criminals of the cities are enslaved, and obliged to perform the more laborious and disagreeable work.

MORELLI: French writer of the eighteenth century, of whose life Larousse's "Dictionnaire"

says that absolutely nothing is known, tho according to some accounts he was an abbé and lived at Vitrey-le-François. Several of his writings, however, are known and are important, especially his "Essai sur l'esprit humain" (1745); "Le Prince, les délices du cœur ou traité des qualités d'un grand roi et système d'un sage gouvernement" (2 vols., 1751); "Naufrage des îles flottantes à la Basiliade," a social Utopia; above all, his "Code de la nature ou le véritable esprit de ses lois de tout temps négligé ou méconnue" (1755), a book influential in forming the social theories of the French Revolution, and said to be the inspirer of Babeuf (q. v.).

MORISSEAU, CHARLES: Director-General of the Bureau of Industry and Labor, Brussels; born, 1854, at Liège, Belgium; pupil of the School of Mines, Liège University; won his diploma as a civil engineer in 1877. From 1877 to 1882 on duty as mining engineer in the collieries of Mariemont and Bescoup, Belgium; appointed in 1882 chief clerk in Belgian Foreign Office; in 1884 secretary to the Minister for Agriculture, Industry, and Public Works. In 1886 a member and one of the secretaries of the great Committee of Labor, established with a view to reforming labor legislation in Belgium and bettering the conditions of the working people. Became in 1887 head of Bureau of Industry. From 1886 to 1899 helped in the shaping and passage of almost every law or regulation relating to labor, besides organizing and supervising various social inquiries and the general census of industries in 1896. In 1899 was made general inspector of finance to the Mozambique Company and became general manager of the company in 1904. Has now returned to his position as Director-General of Bureau of Labor. Address: Rue Lambermont 2, Brussels.

MORMONISM: The Mormon Church we consider here in its relation to social problems. Beginning in 1831 at Fayette, N. Y., in the preaching of Joseph Smith, Jr., based on a revelation he claimed to have received on golden plates, written, long hidden, and finally revealed to him, by a prophet Mormon. Mormonism claims to be a Christian religion, believing in Christ, in the Trinity, and in the Bible. With "The Book of Mormon" Smith's preaching gained many followers, and in 1831 a prosperous Mormon settlement was made at Kirkland, Ohio, and a temple built. Persecuted here, Smith led his followers in 1837 to Far West, Mo., and driven from there to Nauvoo, Ill., where their numbers reached 12,000 and they were prosperous in every way. A discontented member, however, made trouble. Dissension arose; the civil authorities were called upon, and Smith was shot by a mob from the neighboring region in 1844. Brigham Young, who had joined the sect in 1832, now became leader, and led the community to Council Bluffs in 1845, and in 1847, after an amazing march across the prairies and over the mountains, to what is now Salt Lake City in Utah. When the United States acquired this territory, the Mormons desired to form a new state called Deseret, but Congress would not allow this, and in 1850 the Territory of Utah was formed, Brigham Young being the first governor. In 1852 the practise of polygamy was first openly proclaimed, and even enjoined upon Mormons as a means of grace, tho it is said to have been promulgated within the church in 1843, and is said by some to have been

practised by the leaders from the beginning of the church. This step created opposition through the country, and as early as 1862 Congress took some steps to stamp it out. Little, however, was accomplished. The Mormon priesthood had all the power in the territory, and little could be done. In 1882 stronger efforts were made. The Edmunds Law made bigamy and polygamy in U. S. territories punishable with a fine of not over \$500 and imprisonment up to five years. Any one cohabiting with more than one woman could be imprisoned six months or fined, \$300 or both. Any jurymen who believed in polygamy could be challenged. All elections were conducted by a special federal commission, and polygamists were disfranchised; 12,000 men and women—for women had been given the franchise by the Mormon authorities in 1870, and had strongly supported the church—were thus disfranchised. Later, in 1887, all women were disfranchised. Adultery and fornication were made criminal offenses. Witnesses were compelled to testify. Marriages must be fully registered, and all illegitimate children were denied right of inheritance. Special oaths were required from voters declaring that they were not polygamists. By such measures polygamy was broken up, and in 1890 Gentiles for the first time obtained control of the municipal government; 1,100 persons were said to have been convicted of polygamy, and over \$50,000 of church property was confiscated. Finally, in 1890 Pres. Wilford Woodruff issued a pronouncement against polygamy. Brigham Young had died in 1877. Since then the division between Mormons and Gentiles has considerably died away. Intermarriages took place. Social and business intercourse is continual. In 1894 President Cleveland granted amnesty and civil rights to all convicted of polygamy. In 1896 Utah was admitted as a state. The church authorities, however, are still accused of demanding obedience to them in political as well as religious affairs. For the most recent events see below.

The industrial and economic development of the Mormons, or the Church of Jesus Christ or Latter Day Saints, as they are called, is marked. The system seems to be purely paternal, even tyrannical, but industry is encouraged, and all Mormons are given land, none allowed to go in want, fine buildings are erected. Even in the polygamous period only 10 per cent of the people were said to have practised polygamy. Prominent wives and children of plural marriages declared their homes happy. Prostitution was unknown. Favoritism between wives was forbidden. On the other hand pathetic stories are told of the sufferings of the women, and dark massacres, like those of Mountain Meadows in 1857, and other deeds seemingly traced to the door of the leading authorities of the church. The number of Mormons is increasing in all the states near Utah. In 1890 there were reported 144,352; in 1906, 300,000, with 796 churches and 700 ministers.

The most recent public controversy concerning the Mormon Church has been as to the seating of Senator Smoot, a member of the Mormon hierarchy elected to the U. S. Senate. We give a brief representative statement pro and con, as these sum up the whole present status of the controversy.

The Hon. A. J. Hopkins, U. S. Senator from Illinois, a member of the Committee of Privileges and Elections, who joined with three other Re-

publican members of the committee in a minority report favorable to Smoot, says in brief (*The Independent*, Jan. 24, 1907):

The grounds on which the seat in the Senate of Reed Smoot, of Utah, is contested are as follows: First, that he is known to have taken what is spoken of as the "endowment oath," by which he obligated himself to make his allegiance to the church paramount to his allegiance to the United States.

Second, that by reason of his official relations to the church as one of its apostles, he is responsible for polygamous cohabitation, which yet continues among some of the Mormons, notwithstanding it is prohibited by law.

The charge that Senator Smoot is himself a polygamist was never seriously pressed before our committee. He is, and always has been, opposed to the practise of polygamy in the church, and in the State of Utah has been one of the bitterest foes of polygamy.

The evidence that was offered on the first proposition relating to the endowment oath was of a character that would receive but little consideration in a court of justice. The witnesses contradicted each other as to the wording of the oath and its character. Some of them were shown to be of bad repute, others mentally unsound, others drunkards, and others who had private grievances that so warped and distorted their opinions and statements that they were entitled to but little, if any, credence.

There were only seven of all the witnesses who testified against Senator Smoot, who attempted to give the endowment oath. These witnesses were contradicted not only by the positive testimony of Senator Smoot himself, but by a great number of witnesses whose character and reputation for truth are unquestioned. In my opinion, the charge relating to the endowment oath was not only not sustained, but the clear preponderance of the testimony showed that there was nothing in that oath that interfered in the slightest degree with Senator Smoot taking upon himself the obligations of a senator of the U. S., and performing faithfully and efficiently the duties of that great office.

Endowment Oath

The senator himself said that he took the endowment oath when he was a youth of eighteen years, and that, as he remembered the oath, there was nothing in it that conflicted with his duties as a citizen of the state or of the U. S., or with his duties as a U. S. senator.

Much has been made by the general public out of the fact that he holds an official position in the church itself, being one of the twelve apostles. Those who would have him expelled from the senate claim that, by reason of this position, he is responsible for polygamous cohabitation, which yet continues among some of the Mormons in Utah. This is the most serious charge that has been pressed by those who seek to have him expelled from the senate. To understand fully the nature and character of his position as one of the twelve apostles and his responsibility—or, rather, non-responsibility—for the practise of some of his associates, it is necessary to challenge the attention of the public to the attitude that the government of the U. S. has held toward the Mormon Church, and those who are leaders of the church, in preaching and practising polygamy.

The federal government is in part responsible for the polygamy that we find in Utah to-day. President Fillmore, in 1850, gave both recognition and encouragement to the practises of polygamy in the Mormon Church in Utah by appointing Brigham Young, the head of the church, governor of the Territory of Utah, with full knowledge that he was an open advocate of polygamy and at the time had a number of plural wives. The Senate of the U. S. confirmed that appointment. He was reappointed by President Pierce and reconfirmed to the great office of Governor of Utah by the Senate of the U. S. For many years polygamy was taught by Brigham Young and his followers as one of the doctrines of the church, without any interference upon the part of the general government; and plural marriages were entered into without objection or any legislative hindrance.

There has been much legislation by the Congress designed to prohibit both plural marriages and polygamous cohabitation. The successive acts were fought through to the court of last resort and then came the "manifesto" of Wilford Woodruff, forbidding further plural marriages. At the time it was issued there were 2,400 polygamous families in the Territory of Utah. There were, in 1905, over 300,000 members of the Mormon Church in the State of Utah; of this number there were only 500 polygamous families. Since the manifesto of 1890 very few plural marriages have been entered into by Mormons. Time is the great corrector of this evil. The 2,400 polygamous families of 1890 had dwindled to 500 in 1905. No new polygamous marriages are recognized or permitted by the church.

Polygamous Marriages

From the fact that, under the statutes of 1852 and 1887, the children of plural wives were legitimized, it has been felt unwise by many non-Mormons of Utah to prohibit the fathers of such children from living with, supporting, and caring for them. And if the father was to support, educate, and care for his

children, it seemed to many heartless to exclude from this relationship the mother, who had entered into this relation from the purest motives and at a time when she believed that, in the sight of God and man, she was justified in entering into this relation.

Senator Smoot, by the determined stand that he has always taken, has been one of the great factors in the church in stamping out polygamy. He has not only lived up to the spirit of the laws of our country and the manifesto of 1890 of his church, but has been an active and earnest worker in the church to spread the sentiment that no more plural marriages will be tolerated.

The testimony that was taken before our committee shows that one of the bishops of the church who violated the manifesto and the laws of our country by taking a plural wife outside the limits of Utah, when he returned to the state was prosecuted by Senator Smoot before the courts of the state and was also deprived of his official position in the church by the direct influence of Senator Smoot.

Since Reed Smoot became one of the twelve apostles of the Mormon Church in 1890, the conditions in Utah have been such that Gentiles as well as the Mormons have acquiesced in a polygamous cohabitation with those few remaining who married before the manifesto of 1890.

They have recognized that such polygamous cohabitation is an evil, but that the interests of society will be best subserved by permitting time to eliminate the few polygamous families, comparatively, that yet remain.

The people of Utah have the same right to elect their senator from the Mormon faith that the people of another state have to elect their senator who is a member of the Methodist, Presbyterian, or Catholic Church. The people of Utah have elected him as one of their senators, and I see no valid or legal reason for interfering with the choice of the people of that state.

A contrary view is expressed by the Rev. S. E. Wishard, D.D., a synodical missionary of the Presbyterian Church for Utah, with headquarters in Salt Lake City, said to be a careful man and to know whereof he speaks. He says in brief (*The Independent*, Jan. 12, 1907):

The Mormon hierarchy has violated the oaths and covenant made with the U. S. Government, by which statehood was secured. The president of the church, of whom the authorities of the church declare and teach that "he has the same authority that God has, and by virtue of that authority is in reality a part of God," has sworn before all the country that he is a lawbreaker. Mr. Smoot, knowing that fact, voted to sustain this lawbreaker as the "prophet, seer, and revelator," as "having the same authority that God has."

It is said, "Now and then plural marriages take place; sometimes escaping the law by being celebrated in Mexico. There never has been a man punished by law or disciplined by the church for the crime. Three of the apostles have entered into plural marriages without modestly retiring to Mexico. They have all escaped the law, and that without going abroad to hide their crimes."

Fifteen men control the Mormon people in all the world. Nearly all of them are violating the law, and the three or four men who are kept out of polygamy for a purpose are sustaining the criminals, living in harmony with them, offering no rebuke for lawlessness and crime.

In the days when Utah was a territory, under national government, Congress sent some of these same men to the penitentiary for violating the law of the government. They were amnestied on their pledge to abstain from crime and have violated their pledge. Are they less criminal for violating their own state laws and constitution which they adopted to get statehood and escape control of the laws of Congress?

It will be said that Apostle Smoot is not himself a violator of the law, a criminal, and therefore should not be disturbed. I reply that he consents to the conduct of the criminals, is at one with them, sustaining them in their unlawful conduct, and attempts to reap the benefit of the same. In legal phrase he is *pariceps criminis*. Indeed, he is in the Senate of the U. S. by virtue of his support of these men in their crime.

That the hostility of the Mormon hierarchy is not a figment of non-Mormons, an invention of "the bigoted persecutors of Mormons," will be seen by their own statements. The men who speak and teach for the Mormon people shall be permitted to speak for themselves.

1st. "The priesthood . . . holds the keys of Revelation of the oracles of God to men upon the earth; the power and the right to give laws and commandments to individuals, churches, rulers, nations, and the world; to appoint, ordain, and establish kingdoms." "Key to Theology," Fourth Edition, p. 70, a book published and sold to the people.

2d. "The priesthood 'is the legitimate rule of God, whether in the heavens or on the earth, and it is the only legitimate power that has a right to rule on the earth.'"—Apostle John Taylor in "Journal of Discourses," vol. v., p. 186.

3d. "Some may inquire, Is it right, is it lawful, for another

government to be organized in the U. S., of a theocratical nature? Yes, perfectly so."—Apostle Orson Pratt, "Journal of Discourses," vol. iii., p. 72.

The Mormon hierarchy claims to be that theocratical government, and has ruled the people with despotism.

4th. "The day will come when the U. S. Government and all others will be uprooted, and the kingdoms of this world will be united in one, and the kingdom of God [which always means the Mormon hierarchy] will govern the whole earth, and bear universal sway."—Vol. iii., p. 71.

5th. "The kingdom of God [the Mormon hierarchy] is an order of government established by divine authority. It is the only legal government that can exist in any part of the universe. All other governments are illegal and unauthorized."—Apostle Orson Pratt on the Kingdom of God.

6th. "When God sets up a system of revelation, as he has done by the priesthood in these latter days, he sets up a system of government that shall rule both temporal and spiritual matters."—*Millennial Star*, vol. xxiii., p. 214.

7th. "The priesthood will bear rule, and hold the government of the kingdom under control in all things."—*Journal of Discourses*, vol. ii., p. 189, Brigham Young.

These quotations, teaching the supremacy of the Mormon hierarchy over all civil government, can be multiplied almost without limit. These teachings claim to be inspired, and have never been repudiated, changed or modified, but practised to their utmost limit. It is to be noted always and everywhere that the hierarchy never uses the phrase "Kingdom of God" as referring to the spiritual reign of Christ, but to the material and political supremacy of the Mormon priesthood as "the only legal government that can exist in any part of the universe."

Apostle Smoot had to get permission, by a law of the priesthood, from the other members of the hierarchy to be a candidate for the Senate. And when that permission was granted the Mormon legislature had only one thing to do, and that was to elect him. He is therefore in the Senate to represent the hierarchy, and not the American sentiment. . . . It will be well for the American papers to make the discovery soon which has been patent to the patriotic people of Utah for many years.

MORRIS, MAX: Fourth vice-president of the American Federation of Labor; born 1866, at Mobile, Ala.; self-educated. At an early age he went to Colorado and found work at various trades. In 1884 he became a clerk and from the first took an active interest in the movement for the organization of that honorable calling. In 1896 was elected international secretary-treasurer of the Retail Clerks' International Protective Association, a position he has held ever since. Starting with a few struggling unions, by a wise and vigorous policy he has built up an organization numbering 50,000 members. One of the principal benefits largely secured by the association has been the earlier closing of retail stores, a custom now become almost universal. Mr. Morris has served three terms in the Legislature of Colorado. He believes that conditions are changing so rapidly that no set line of policy is to be followed by those seeking the advancement of labor, but every opportunity must be watched for and eagerly seized upon to better the situation and the prospects. Address: 318 Appel Building, Denver, Col.

MORRIS, WILLIAM: Poet; Socialist; born at Walthamstow, near London, 1834. He was educated first at the school of that place, at Marlborough, and at Exeter College, Oxford. In 1856 he was articled to Mr. Street, the architect. He also studied painting, but in 1863 devoted himself mainly to the design and manufacture of artistic household furniture, wall-paper, stained glass, and other decorations. Later on started an ideal factory near Merton Abbey, and founded the "Kelmscott Press," for printing according to the canons of the truest art. In literature he early commenced contributing to the papers, mainly the *Oxford and Cambridge Magazines*. During the next twenty years he made himself one of the foremost names in modern English

letters, especially in his poems. Now came a change. Up to 1877 he had been, as he called himself, "the idle singer of an empty day." His experience in the commercialism and consequent degradation of modern art now drove him to socialism. In 1885 he was instrumental in forming the Socialist League, and since that time he worked strenuously for socialism, editing and writing for *The Commonwealth*, attending meetings and addressing open-air audiences of working men. He published numerous Socialist lectures, tracts, and chants, such as "Art and Socialism" (1884); "Signs of Change" (1888); "Useful Work versus Useless Toil," etc. In 1888 he republished from *The Commonwealth* "A Dream of John Ball," a most beautiful Socialist prose poem; in 1892 "News from Nowhere," a socialistic and artistic Utopia; and in 1894, in conjunction with Belfort Bax, "Socialism, its Growth and Outcome." Altho he retired from the editorship of *The Commonwealth*, which passed into Anarchist hands, Mr. Morris worked most fruitfully as "poet, artist, and Socialist" until his death, which occurred Oct. 3, 1896.

MOSELY, ALFRED: English economist and philanthropist; born 1855 at Bristol, England. Was educated privately and in Bristol Grammar School. During the Boer War he went to South Africa as a staff member of the Princess Christian Hospital, and was decorated for his services in behalf of the sick and wounded. In 1902-3 he conducted an English commission of twenty-six members to study industrial and educational conditions in the United States, and as a result an important report of their findings was issued. He was a member of the Tariff Commission in 1904, and is author of "Reports and Pamphlets on Industrial and Educational Matters and Economics." Address: West Lodge, Hadley Wood, Barnet, England.

MOSES (Hebrew *Moscheh*): The great leader of the Hebrew race, who led them out of slavery in Egypt and founded the Hebrew theocracy in Palestine. Modern scholarship has thrown grave doubts on the Mosaic authorship of the Pentateuch, but few question that Moses was an historical character and one of the greatest leaders and social reformers of the human race. There are traditions of him (Egyptian) in Manetho, (Hebrew) in the "Midrash," and Josephus (Greek) in Philo, tho they are mainly based on the Bible narrative. He was probably born at Heliopolis in the eighteenth dynasty in Egypt, or 1500 B.C., according to the Bible chronology. His social system was a theocratic socialism, based on the fatherhood of God and the unity of the people. Land was considered as belonging to God, and the individual only allowed and protected in its use. The poor and infirm were particularly protected. (See JUDAISM; also the Bible itself: Genesis, Exodus, Leviticus, Numbers, Deuteronomy.)

MOST, JOHANN JOSEPH: Prominent anarchist; born at Augsburg, 1846; moving to Berlin, early became known as a leader of the most violent and anarchistic wing of German socialism in connection with the International; he was driven out of their organization by the Socialists. Expelled from Berlin, 1878, he went to London, and there, 1879, founded the *Freiheit*, an organ of anarchist communism. In 1881 he was con-

demned to sixteen months' hard labor for his incendiary utterances concerning the assassination of the Czar. In 1882 he emigrated to New York, and published his paper from that city. Imprisoned more than once, he became the leading anarchist-communist in the United States. He was the author of "Die Lösung der sociale Frage"; "Die Anarchie"; "Social Monster," etc. He died in 1906.

MOTT, LUCRETIA COFFIN: Woman's suffragist and abolitionist; born 1793 on Nantucket Island, Mass. She was educated at a Friends' school near Poughkeepsie, N. Y., where she met James Mott and married; 1818. She became a preacher among the Quakers, and joined the Liberal or Hicksite Party, 1827, owing to her strong hostility to slavery. After attending the American Anti-Slavery Society Conference, she organized the woman's section of that body. But the feeling for abolition was not universal among the Friends, and when, in 1840, at the World's Anti-Slavery Convention, women were excluded, she and Elizabeth Cady Stanton discusst plans for a woman's right movement, which they launched in 1848 at Seneca Falls, N. Y. Besides the abolition of slavery and the attainment of woman's rights, she was interested in the temperance movement and other endeavors for the uplift of mankind, e. g., universal peace. She died 1880.

MUENSTERBERG, EMIL: German jurist; author; born, 1855, in Danzig; studied in Zurich, Leipsic, and Göttingen. As assessor in 1882-83 he became interested in social questions and devoted his leisure to the study of national economics and politics at the University of Berlin, as well as to his work of the Poor Board, and has practically since that time been continually absorbed in the study of the theoretical and practical working of the poor-law system. In 1887 was made a judge of the court in Menden, Westfalen, and from 1890-92 was Mayor of Iserlohn. Called by the Senate, in 1892, to Hamburg to reorganize the system of poor-laws there. Dr. Muensterberg afterward settled in Berlin to busy himself with social and scientific work. He was chosen city councilor in 1898, and since that time has been president of the poor board of the city. Particularly interested in public charity organization and the education of public opinion in these matters both by speaking and writing. A member and president of many social and benevolent organizations, and general secretary of the National Conference of Charities. He is author: "Individual-Charity Statistics"; "The Draught of a Civil Code Relating to Charities"; "Rural Poor-Laws"; "A Union of Public and Private Charities"; "Care for the Homeless in Cities"; "Alimony, An Introduction to Practical Charity"; "Woman's Charity Work," etc. Address: W. 10 Dörnberg Strasse, Berlin, Germany.

MUN, COMTE DE: French Catholic Christian Socialist; born at Lumigny, Seine-et-Marne, 1841. He served in the army as an officer of cuirassiers, and took part in the Franco-Prussian War, during which he was made a prisoner. After the war he was active in establishing Christian labor-unions, and abandoned his military career. In 1876 he was elected to the Chamber of Deputies, and has been repeatedly reelected. At first a royalist, he threw himself into Catholic Christian socialism, and, a brilliant orator, he succeeded in

forming a Catholic party, but without enduring success. In 1888-89 he was a moderate Boulangerist, and since 1892 has been identified with the republicans. In 1897 he was made a member of the Academy. He has written "Discours et Ecrits Divers" (1888).

MUN, THOMAS: English mercantilist; born in London, 1571. He amassed a considerable fortune by commerce with the East. In 1628 he had charge of a petition from the merchants of

facts, making possible in Part I. the condemnation of large slum areas and the provision for rehousing at least one half (in London) of the people displaced; in Part II. the dealing with and reconstruction of small slums; in Part III. the erection of workmen's dwellings on any areas. Under these acts English cities have recently done large work. The London County Council has formed a special housing department. *The Municipal Year Book* (1906) gives the following summary of its operations:

HOUSING OPERATIONS OF THE LONDON COUNTY COUNCIL TO MARCH 31, 1905

| | Number of persons displaced or to be displaced from insanitary areas | NUMBER OF TENEMENTS OF | | | | | | Total number of tenements | Total number of persons provided or to be provided for | Estimated value of land for housing purposes and cost of buildings | Estimated cost of clearance |
|---|--|------------------------|-----------|-------------|------------|------------|-----------|---------------------------|--|--|-----------------------------|
| | | One room | Two rooms | Three rooms | Four rooms | Five rooms | Six rooms | | | | |
| Buildings already completed and occupied | | 160 | 2,927 | 2,381 | 369 | 89 | 3 | 5,929 | 31,339 | £1,739,117 | |
| Buildings in course of erection | | 10 | 231 | 516 | 167 | 119 | | 1,043 | 7,006 | 404,888 | |
| Buildings for which working drawings are being prepared | | 15 | 364 | 469 | 122 | 1 | | 971 | 5,304 | 308,886 | |
| Insanitary areas already dealt with | 13,273 | | | | | | | | ¹ 14,188 | | £477,952 |
| Insanitary areas now being dealt with | 3,542 | | | | | | | | ² 3,904 | | 504,700 |
| Street improvements and tunnels—Completed | 10,583 | | | | | | | | ¹ 10,542 | | |
| In progress | 1,661 | | | | | | | | ² 2,535 | | |
| Totals | 29,059 | 185 | 3,522 | 3,366 | 658 | 209 | 3 | 7,943 | 43,649 | £2,452,891 | £982,652 |
| Buildings for which plans are in course of preparation | | | | | | | | | 52,012 | 2,471,035 | |
| Grand totals | | | | | | | | | 95,661 | £4,923,926 | £982,652 |

¹ These are included in other divisions of this summary, and are therefore not included in the total.

Ostend to Parliament; in 1630 he received from the Grand Duke of Tuscany a license to trade in his dominions. He died in 1641. Mun is one of the earliest English mercantilists. His chief work, containing excellent reflections upon supply and demand, and practical conclusions which it would be well for England to apply, is still extant. It is "England's Treasure by Foreign Trade" (probably written in 1630, but not published till 1664, long after his death). It is noteworthy that, in opposition to many mercantilists, he advocated the exportation of gold when a surplus of that metal remained in the country.

MUNICIPAL HOUSING (IN GREAT BRITAIN) (for Germany and other countries, see HOUSING): Housing legislation in Great Britain began with Lord Shaftesbury's Act of 1851, amended and added to, but without large results down to 1882. Under these acts the (London) Metropolitan Board of Works, however, spent £1,325,415 on 16 schemes, selling or letting lots to various companies for 7,026 working-class dwellings, with 14,093 rooms. Birmingham cleared 95 acres for £550,000; Glasgow, 88 acres for £600,000; Liverpool spent £500,000; Greenock, £200,000; and Wolverhampton, £207,862. In the majority of these cases some of the persons displaced were rehoused in dwellings erected by the municipal authorities.

Owing to the expensive working of these acts, however, they were not used much after 1882, and it became necessary to consolidate and amend them by the Housing of the Working Classes Act, 1890, modified by subsequent acts, particularly in 1903.

The principal act as to housing has three main

The largest of these undertakings is that of the Wood Green and Tottenham estate, situated in the parishes of Tottenham, Wood Green, and Edmonton, some six miles from the city, and comprising altogether 225 acres. It is estimated that accommodation for 42,500 persons in cottages and in tenements over shops can be provided on the estate. The cottages, which will be two stories in height, will contain three to five rooms each, and each will have its own garden. It is proposed to take advantage of the River Moselle, which runs through the eastern portion of the estate, and some slightly rising ground upon its bank, which is difficult to build on, to arrange a public garden of about two acres and a quarter, with the river flowing through it. Four other smaller gardens will be arranged on other parts of the site, which will help to preserve the healthiness of the estate. There will be a public library and other improvements, including cheap and easy access to the city.

Besides the housing operations of the London County Council, the city corporation (in the city proper), the Borough Councils of Battersea, Brompton, Camberwell, Chelsea, Hammersmith, St. Marylebone, St. Pancras, Shoreditch, Stepney, Westminster, Woolwich, and other London boroughs have undertaken various housing schemes.

Outside of London, Glasgow, beginning in 1866, has redeemed a tract of 88 acres and, at large expense, built 30 new streets, a large number of houses, which it rents and has thus gained a revenue, slowly paying off the total cost, providing better homes, and giving the city a valuable property. Alexandra Park has been laid out; municipal lodging-houses built. Over

£2,000,000 has been expended. Much work has been done in the erection of block dwellings and lodging-houses for the very poor. These include 527 one-room, 1,165 two-room, 257 three-room dwellings. Altogether, 1,965 dwellings, containing 3,700 rooms, have been erected by municipal action in various parts of the city. The lodging-houses show a profit of 4 to 4½ per cent, and the dwellings give a return of about 4½ per cent. The rent "per 1,000 cubic feet" varies from 1s. 4d. to 1s. 8d. per week, and the cost of building has varied from £70 to £93 per room.

Liverpool by 1906 had demolished a large number of unsanitary houses and erected 1,224 tenements; 118 one-apartment houses; 542 two-apartment houses; 449 three-apartment houses; 115 four-apartment houses, with 13 shops; more tenements are under construction. Rents in these vary from 2s. to 5s. 6d. per week. The total number of rooms completed to the middle of 1905 was 4,058, with 15 shops, and the cost of building, together with the valuation of sites for housing purposes, was £332,000, while the gross annual rental was £16,500. Thus the average inclusive cost was about £80 per room, and the average rent about 1s. 6d. per room per week. The net return on the later dwellings is from £1½ to £2 per cent; and the charge on the rates in respect of rehousing the dispossessed is £6,000 per annum, or a rate of about 4d. in the pound. This, however, includes the provision of a sinking-fund, which will put the ratepayers in possession of valuable properties at the expiration of periods varying from 30 to 60 years.

Birmingham has undertaken even larger schemes. The first area dealt with was 93 acres in extent. The houses were old and dilapidated, and the death-rate double that of the healthiest part of the borough. The estimated expenditure was as follows: Cost of purchasing properties, £1,310,000; street-making, £34,000; total, £1,344,000. Less value of surplus land, £794,000. Net cost, £550,000. One of the streets formed on the area is Corporation Street, 1,484 yards long, 22 yards wide. The city did not acquire all the properties. It purchased about 45 acres, and 1,867 dwelling-houses out of 3,744 upon the area. About 1,200 were taken down; the remainder were repaired and put in sanitary condition by removing buildings where too crowded, rebuilding conveniences, paving yards, providing proper system of drainage, etc. The greater portion of land acquired has been let on building lease (75 years) for shops and other premises. The ground rents produce about £45,902 per annum, and the rents of premises left standing on the uncleared portion of the land amount to £17,109 per annum gross. The city has acquired other areas not so centrally situated, and has provided thereon 103 cottage dwellings, which more than pay their way.

Manchester has cleared several large areas, and has erected on them block dwellings, tenement-houses, cottages, and a model lodging-house. Plans have been prepared for the development of the Blackley estate of 243 acres on the city boundary, acquired at a cost of £36,646, for houses for the working classes and also for allotments.

Virtually all the larger cities in Great Britain and many smaller boroughs have undertaken similar housing schemes, in proportion to their size. (For statistics of totals, see MUNICIPAL TRADING.)

MUNICIPAL MARKETS AND ABATTOIRS:

Markets and abattoirs in Europe are very largely municipal. As a rule, municipal markets are a source of profit to the authorities, but the main benefits derived from municipal ownership are cleanliness, public convenience, and the protection of the purchaser from unsound food. In Great Britain extensive and successful markets are owned by the municipalities of Birmingham, Glasgow, Edinburgh, Bradford, Bolton, Wolverhampton, Exeter, Halifax, Huddersfield, Leeds, Newcastle-on-Tyne, and Shrewsbury, and by the Corporation of the City of London.

Glasgow has the largest cattle market and public abattoir in Scotland. Edinburgh has made excellent provision, too, and, in England, Leeds possesses an abattoir, constructed in 1899, which is a model of what is required in modern cities.

France led the way in the provision of abattoirs and meat markets; Germany has now more municipal abattoirs than any other country in Europe, even the smallest German city having them.

MUNICIPAL MILK-SUPPLY: By the term municipal milk-supply is meant the taking over of the milk industry of a town by the public health authority and its organization in one system, such as the postal service. This would involve the ownership of the farms with their live stock, the treatment and distribution of the dairy produce by the local governing body, and the control of all the conditions of milk production by a committee of the Town Council. Thus the supply of milk would follow the lead set by the chief water-supplies in Great Britain, and would be carried on with a regard for public utility and safety, and not for the ends of private profit.

But the term often implies only a partial municipalization of the milk industry, and in this case it may be meant to imply one of the following:

1. A depot owned and worked by the town authority, receiving its milk either from its own farm or from a privately owned one, and supplying either simple or modified milk for infants who are obliged to be hand-fed. The article supplied may be had either above, at, or below cost price. Such depots are under the control of the Medical Office of Health, and there is always careful supervision of the children being fed and of the sources of milk-supply. 2. Some may imply by the term under discussion simply one or more depots established by the local authority for the sale of pure milk to the poorer classes only, thus insuring the better nourishment, and a higher standard of purity of food, for those who are least able to look after themselves. Such a system has been inaugurated privately in Paris by D. Rothschild, and in Copenhagen by M. Busch.

The movement is commencing in earnest in most European countries and also in America, and represents a revolt against the present unsanitary and disorganized state in which the milk-supply is at present carried on. The recent parliamentary inquiries conducted in Great Britain into alleged physical deterioration of the people, have shown that wide-spread physical unfitness does exist, that the reduction in sixty years of the general death-rate has been considerable (22.4 period 1841-50 to 18.2 in the decennium 1891-1900), while the infantile mortality in the same period shows no signs of reduction, being about 152 per 1,000 births in both periods named. This has led to more inquiry into the part played by the food of the younger generation—of which

milk does or should form an important factor. This inquiry has shown that *for adults* the food-supply has, since the days of the repeal of the Corn Laws, improved in quantity and quality, and has also become less adulterated. On the other hand the decline in breast-feeding has been accompanied by a reduction in the quality and purity of the milk upon which infants were being increasingly fed. A pure water-supply, gained entirely through State and municipal action, reduced the epidemics of the nineteenth century, while milk epidemics are still very serious and common. Thus a movement of the science of public health toward the personal life of the citizen was bound to lay great stress upon the necessity for the immediate reform of the milk-supply.

So far no public authority has taken over the supply of milk as a whole. But there are many instances in the United Kingdom of municipal milk depots for infants. The first depot was established at St. Helens (Lancashire) in 1899; others followed: Liverpool, Ashton-under-Lyne, and Dukinfield in 1901, Battersea in 1902, Leith and Bradford in 1903, and Bromley, Glasgow, and Dundee in 1904. Lambeth and Woolwich are commencing installations. The Finsbury (London) borough has just taken over the depot started under private auspices. In the United States the city of Rochester, N. Y., in 1897, established an infants' milk-supply. Here the control of cows, utensils, bottles, etc., is directly in the hands of the health authorities, and the processes are carried out at the farm. In France the municipality of Lyons has just established a depot in connection with its own farm. In Germany, Spain, and other European countries the movement is spreading, but it is at present worked mainly on private lines with municipal subsidy.

The following facts have come to light: 200 typhoid-fever epidemics have been traced to polluted milk in Great Britain, about 18 epidemics of diphtheria, 73 outbreaks of scarlet fever. In 1901 there were 30,121 deaths from infantile diarrhea—a disease closely associated with a polluted milk-supply. In Brighton, in 1901-2, there were 226 deaths due to the latter cause, and 191 were traceable to the conditions of milk-supply. In the United Kingdom it is estimated that milk is daily being consumed from 40,000 tuberculous udders.

The milk trade, by the very nature of the article dealt with, essentially favors dishonesty. Dirty methods are hidden by the use of chemical preservatives in the milk. But in addition, water is commonly added to the whole milk, or it is "toned down" with separated milk, cream is abstracted, and diluted condensed milk is used as an adulterant also. In 1902 11.6 of the samples taken for analysis in England and Wales were reported against. In London in the same year 15.6 per cent was the number. In Finsbury 25 per cent of samples were adulterated (taking a period of ten years). The Local Government Board of England estimated, in a report, that Londoners were paying £30,000 per annum for water illegally added to their milk.

The problem is how to supply a pure article from healthy cows, passing through as few hands as possible, and this without raising the price. At present the large number of small producers tends to hide the dangers of dirty production, makes it difficult to seize and destroy all diseased

animals, and render contact with dirt and disease much more likely. All these dangers would be eliminated, it is claimed, by the public health authority taking over the whole supply. At present the towns are the consumers and the rural districts the producers, and in these rural districts it is to the interest, both private and on the ground of local taxation, to leave all the sanitary laws concerning milk production unadministered. This is the case now. By municipalization you identify sanitary and financial interests, and make the destruction of diseased animals and the breeding of a sound herd much easier.

More capital expenditure would be needed in the industry, and much more skilled laborers, and this could be made up by the great economies in cartage and general handling which a single system would render possible. F. LAWSON DODD.

MUNICIPAL OWNERSHIP (for a general discussion of the economic principles involved and the arguments pro and con, see PUBLIC OWNERSHIP. For statistics as to public ownership in Great Britain, see MUNICIPAL TRADING. For municipal ownership in Germany, see MUNICIPALITIES (GERMAN). For the United States, see LIGHTING, ELECTRIC AND GAS; STREET-RAILWAYS; WATER-WORKS. See also BERLIN, BIRMINGHAM, CHICAGO, GLASGOW, LIVERPOOL, MANCHESTER, NEW YORK, LONDON, PARIS, VIENNA): We give here a general outline of the history and development of municipal ownership.

THE MUNICIPAL MOVEMENT

The advance of municipal ownership in recent years has been very remarkable. From 1800 to 1900 public water-works in the United States developed in round numbers from 6 per cent to 60 per cent of the whole number. Of the fifty largest cities in the U. S., twenty-one originally built and now own their own water-works; twenty have changed from private to public ownership, and only nine are still dependent on private companies for their water-supply.

The public gas plants in the U. S. numbered fifteen in 1900 and twenty-five in 1906, a growth of 67 per cent against an increase of 48 for the private gas works. There are altogether 130 public gas plants in this country, but most of them are small affairs, which it is hardly proper to include in this summary.

In 1881 there was but a single public electric lighting plant in the U. S. There are now 1,097, and the latest Census Bureau report (1902) shows that thirteen plants have changed from private to public operation for each plant that has changed the other way.

The municipal ownership of street-railways in this country has scarcely begun, there being as yet only one public plant, the municipal street-railway system of Monroe, La., which was opened for business Aug. 1, 1905, and is very successful, according to the account sent me by the mayor, and the statements published by the street railway journals.

In Great Britain more than three quarters of the water-works are owned by local authorities. More than one half the gas supply outside of London has been municipalized. More than one half the electric lighting plants belong to municipalities, and about one half the street-railway systems are owned and operated by municipalities with nearly 60 per cent of the total track mileage. From Jan., 1894, to March, 1906, the tramways operated by municipalities rose from 2 per cent to 49 per cent of the whole number of tramways in the United Kingdom, and is now over 50 per cent.

The main causes of the movement for the municipalization of public utilities in Great Britain are to be found in the desire: (1) to secure a better and more extended service. (2) To obtain lower rates. (3) To secure for the city the profits of public-service industries. (4) To improve the conditions of labor. (5) To identify the interests of owners and the public and bring into harmony with the public welfare powerful monopoly interests, which in private hands manifest more or less opposition to the public good. (6) To secure to the city, direct, continuous, and complete control of its streets and all monopoly uses of them. In the U. S. the principal causes of the municipal-ownership movement have been the tendencies to overcapitalization, excessive charges, inadequate service, and disregard of public health and safety, manifested by private companies, and their corrupt and demoralizing relations with our governments and public officials.

Except in the supply of water municipal ownership has not yet had a fair chance in the U. S. owing to adverse laws, the prevalence of the spoils system, and the great power and resistance of the private companies. Even where cities and towns have been allowed to enter upon the operation of these public utilities they have been hampered by serious restrictions in regard to the field of operation, the limitation of indebtedness, etc. Very few of the municipalities which have electric-lighting plants are allowed to do commercial lighting. They are almost in all cases confined to the lighting of the streets. If the law permitted them to sell commercial light, they would be able to reduce the cost of production very materially. Even as it is, however, many public lighting plants make an excellent showing. Detroit, for example, and Jacksonville, South Norwalk, Braintree, Holyoke, Duluth, etc.

Public sentiment in Great Britain is almost a unit in favor of the municipalization of street-using monopolies. The recent election in London in which the Moderates gained a signal victory over the Progressive Party has been interpreted by some as a reaction against municipal operation of public utilities. The leaders of the Moderate Party have, however, distinctly declared that they are not opposed to municipal operation of lighting and transit systems, but only to the invasion of municipal trading into the competitive field—municipal banking, insurance, housing, supply of gas stoves, electric fixtures, etc., and to the general *socialistic* policies of the London Progressives. The elections were mainly fought on national issues, the Education Bill, etc., and was in substance a struggle between two national parties for the control of the monopolies.

In the U. S. public sentiment on this question is practically an unknown quantity. In a few cities where the subject has been more or less fully

discussed, public opinion has shown a strong tendency to move in the same direction as in Great Britain. In New York, for example, after a few months' discussion in a single campaign, it is believed that a majority voted for the municipal-ownership candidate for mayor, tho he did not take his seat owing to a fraudulent miscounting of the ballots. In Chicago on direct referendum the public recently voted three to one and five to one respectively in favor of municipal ownership and operation of street-railways and lighting systems and elected Mayor Dunne on a platform calling for the immediate municipalization of the street-railways.

The legislative difficulties, however, and the practical obstacles were too great to be readily surmounted. The companies took advantage of this situation to give the people even worse service if possible than had been afforded in previous years. The result was that the people became so exasperated with the poor transportation facilities they possess and the prospect of endless litigation and obstruction, that they finally accepted as a compromise the ordinances drawn up by Walter L. Fisher, as municipal-ownership counsel for the city in corroboration with the street-railway companies, providing for thorough reorganization of the service under temporary franchises subject to municipal purchase and operation at such time as the legal questions as to the validity of the certificates authorized by the Mueller Law as a means of purchase, and other legal questions involved, could be determined and the city be prepared to enter upon municipal ownership free from the present serious handicap.

There are strong municipal-ownership organizations in some of the larger cities, for instance in New York and Boston, also in Detroit, Chicago, Los Angeles, etc. There is also a National Public Ownership League with headquarters at 11 St. James Avenue, Boston, and an anti-municipal-ownership organization called the "Municipal Ownership Publishing Bureau," with headquarters at 119 Nassau Street, New York City.

A brief summary of the data relating to public utilities in the U. S. will be found under other headings above referred to. For the remainder of this article we shall confine ourselves to the municipal movement in Great Britain.

GREAT BRITAIN

Municipal ownership in Great Britain, commonly known as municipal trading (*q. v.*), is not in any sense a theoretical movement, save as it is sometimes characterized by its critics as socialism or as it is supported by Socialists and used as an argument in favor of socialism. As a matter of fact, however, it did not come from the Socialist movement; but rather from the mercantile or commercial classes. The larger cities and boroughs in Great Britain are mainly in the hands of business men, who largely make up the personnel of municipal administration, and the movement began with them. Indeed, it was well under way long before the voice of labor was raised in local affairs. Some cities have owned their water and gas undertakings for more than a generation. The later extension of the movement to street-railways, electric lighting and power, and telephone service has been urged as a natural and proper application of a program which has already justified itself in a financial and social way.

Municipal ownership did not come in unopposed. It is still a heated political question, and occupies a large amount of attention at Westminster and in the press; for public ownership is trenching on private business—on the big business of municipal franchises, and here and there on the small business of the manufacturer and retail dealer. The great mass of the people, however, are with the movement, the opposition coming mainly from a comparatively small number of persons most of whom are interested directly or indirectly in public-service companies.

Many trace the beginning of the present movement to Birmingham, in 1873, when Mr. Joseph Chamberlain, elected mayor, induced the city to buy two great private gas plants and to follow this up by other large undertakings. Others consider the present phase of the movement due to the successful experiment of Glasgow in the operation of her street-railways, which the city took over in 1894. The *U. S. Bulletin of Labor*, Jan., 1906, says in brief:

The general reasons assigned in Great Britain for this growth may be classed as follows:

1. A desire for better and more efficient service. With this was the belief that under public ownership rates and charges could be reduced to the consumer and that the earnings could be used for the betterment of the service or the lowering of its cost.

2. These enterprises were felt to be essentially public in their nature, because of their monopolistic character and the lack of that competition which secures low rates and efficient service in other industries. Moreover, they are identified with the city in many ways. The life and comfort of the people, as well as the proper administration of the city's departments, are dependent upon water, light, power, and transit.

3. The street-railway employees were generally underpaid and overworked. Their hours of labor were from seventy to ninety per week, and wages were low. The condition of the men was constantly under the eyes of the public, and forming a numerous body, they could and did make their grievances heard.

4. It was felt that the earnings of such industries should go into the public treasury.

The first undertakings in the line of municipal ownership, in Great Britain as in the U. S., were water-works, owing probably to the large preliminary expenditures involved and the comparatively small profits to be made by private water-works. Glasgow received powers to go to Loch Katrine, thirty-four miles away, for her water, as early as 1855. Manchester, beginning her water-works in 1847, has purchased Lake Thulmere in the English lake district, 100 miles away, and Liverpool (1877) and Birmingham, inaugurating her system (1904), have gone to Wales, seventy miles from Liverpool. Sheffield and other midland cities have followed suit. London finally bought out her eight great water companies in 1902. (For statistics, see MUNICIPAL TRADING.)

As a rule, a better supply of water and a reduction in the charges for it have resulted from municipalization; and the former has without doubt helped toward an improvement in the public health. The success of public ownership and control is to be gaged from this point of view rather than by reference to balance-sheets. Generally, local authorities have not laid themselves

out to make profits out of water-supplies. In many towns no direct charge is made, the cost of the undertaking being included in the general rates (taxes), and in other cases the charge to consumers is supplemented by a water-rate. But it will be seen, however, from the statistics (see MUNICIPAL TRADING) that, taken in the aggregate, the municipal corporations of England and Wales are making a fair net profit on their undertakings.

There are at present in the United Kingdom 1,045 municipal water-works and 251 private. (In Scotland there are only 14 private, and in Ireland none.)

The municipalization of the gas in Great Britain has been less rapid, tho the manufacture and supply of gas has been in the hands of Glasgow since 1869, and Birmingham

Gas Supply began municipalization of the supply in 1873. In 1882 the total capital outlay by public authorities for 148 gas undertakings in the United Kingdom was £17,326,183; in 1904, £37,103,279. From annual returns to the Board of Trade, as analyzed in the *Municipal Journal* for March 3, 1905, it appears that the average price of gas from the municipal plants is six cents less than the price charged by the private plants (2s. 8d. as to 2s. 11½d.); the per cent of net receipts of capital outlay is considerably higher, tho a number of cities make no charge for lighting the city, while it is quite universal for them to pay higher wages and allow shorter hours to the employees. It appears, too, that the public enterprises are more efficient, for the net receipts of the local authorities amounted to 7.11 per cent of their capital outlay, as against 5.62 per cent for the private companies; while the operating cost of the municipalities was but 73.14 per cent of the gross receipts, as against 74.42 per cent by private capital.

It is the policy of most towns to supply gas at as low a price as possible. Light is looked upon as a prime necessity, and its widest use for domestic purposes a thing to be stimulated. This is achieved in a variety of ways. Public as well as private authorities aid in the sale of gas-stoves and fixtures. Many cities provide meters with a penny-in-the-slot contrivance, by which the very poor are able to secure a supply of from 25 to 35 feet, consistent with their purse. Manchester offers gas-stoves rent free and sets prepayment meters. Birmingham has a similar liberal policy. Sheffield is one of the five large towns still supplied by a private company, and it is so administered in the interests of the community as to be secure in its position.

The Municipal Year Book for 1906 says:

The principal difference between the public and private results is, as usual, to be found in the greater economy of operation and the cheaper charge to the community. The average toll levied by authorities remains unchanged at 2s. 8d. per 1,000 feet, while that of companies has risen ½d. to 2s. 11½d. If authorities charged at the same rate their net revenue would go up from £2,637,677 to £3,419,768, and the ratio of operating costs to income would fall from 73.14 to 67.74 per cent, while the equivalent return on capital outlay would be 9½ instead of 7 per cent. The net revenue of both companies and authorities has increased 12 per cent, but the make of gas by the latter has expanded 3½ per cent, while that of companies has only developed 2 per cent.

Municipal street-railways are a still more recent development. For twenty years after the Act of 1870 the cities built the tracks and leased them to private companies to operate. Only three cities, Huddersfield, Blackpool, and Plymouth, operated their street-cars till Leeds and Glas-

gow began to do so in 1894. Since then nearly every important city in the United Kingdom has followed suit except Edinburgh, Dublin, Bristol, and Norwich. Even in London the municipality owns and operates nearly all the street-railways—115 miles out of a total of 128 miles in the county. Says the *U. S. Bulletin* report:

Street-Railways

By a fortunate coincidence these leases, which were worked as horse-car lines, expired at a time when America and Germany had demonstrated the success of electric traction. As a consequence the cities took over the horse-car lines of the companies and then electrically equipped them. In many instances this involved a heavy cost to the cities, for most of the horse-car equipment, as well as the rails themselves, had to be thrown away. The cities, therefore, entered on their workings burdened with the double capital cost for both horse and electric equipment.

By the terms of the Tramways Act of 1870, and later amendments, the municipality was authorized to take over the enterprise, at the end of twenty-one years, on the physical or "then" value of the plant. The tramway companies contested the method of valuation adopted and claimed something for the franchise. In a case which went up from London (The London County Council vs. The London Street Tramway Company) the court decided that, as the term for which the franchise was granted had expired, the price to be paid was the physical or replacement value, no payment for franchise value being contemplated by the act. The company claimed £604,000 (\$959,804) for depots and 4½ miles of line, but under the decision the arbitrator awarded the company only £101,798 (\$495,400.)

The Board of Trade returns for 1906 show the following statistics for the United Kingdom:

TRAMWAY RETURNS FOR THE UNITED KINGDOM, 1906

| | Local authorities | | Companies | | Percentages | |
|-------------------------------|-------------------|-------------|-------------------|-----------|-------------------|-----------|
| | Local authorities | Companies | Local authorities | Companies | Local authorities | Companies |
| Undertakings owned | 175 | 137 | 56 | 44 | | |
| Miles of line | 1,491 | 748 | 67 | 33 | | |
| Cost per mile of line | £24,916 | £38,072 | | | | |
| Miles of track | 2,499 | 1,009 | 71 | 29 | | |
| Cost per mile of track | £14,870 | £19,250 | | | | |
| Undertakings worked | 123 | 127 | 49 | 51 | | |
| Mileage | 1,276 | 963 | 57 | 43 | | |
| Capital outlay | £31,147,306 | £26,305,028 | | | | |
| Receipts | £6,853,486 | £3,789,692 | | | | |
| Operating expenses | £4,333,734 | £2,512,029 | | | | |
| Their per cent of income | | | 63.08 | 66.28 | | |
| Net revenue | £2,529,752 | £1,277,663 | | | | |
| Per cent of return on capital | | | 8 | 4.8 | | |
| Net revenue per mile | £1,980 | £1,365 | | | | |
| Net revenue per car mile | 7.82 cts. | 6.86 cts. | | | | |
| Car miles run | 154,965,781 | 89,183,683 | | | | |
| Passengers carried | 1,529,596,438 | 706,416,339 | 68 | 32 | | |
| Average fare per passenger | 2.01 cts. | 2.43 cts. | | | | |
| Operating cost per passenger | 1.03 cts. | 1.72 cts. | | | | |

The returns for 1906 show that out of 2,240 miles of lines in operation 1,993 miles were operated by electricity, 72 by steam, 26 by cable, 4 by gas, and 145 by horse power, and the rest by mixed methods.

About 30 municipal systems are still held by companies under lease, but the number is fast diminishing. The mileage thus leased was 215 in 1906, or about 14 per cent of the total belonging to local authorities. Private tramway concerns decreased by 9 during the year, 7 of them passing into the hands of municipal managements. Municipal systems appearing for the first time under public control in 1906 are those of Pool, South Shields, Erith, Leyton, Littleborough, and Walthamstow.

It appears from the data above tabulated that the average fare per passenger is 14 per cent more for the companies than for the public systems, and yet the companies have a higher percentage of operating cost to income. The average working cost per passenger is less than 1½ cents (1.3 cents) for the public systems, and nearly 1½ cents (1.72 cents) for the companies, or 32 per cent higher operating cost for the companies than for the municipalities. Their capital per mile is

larger, and their net revenue considerably less than for the public systems—the return on capital being 4.8 per cent for the companies against 8 per cent for the municipalities. With 57 per cent of the mileage, the municipal systems ran nearly twice as many car miles as the companies, and carried more than twice as many passengers. Their profits are £1,980 per mile against £1,365 for the companies, and 7.82 cents per car mile against 6.86 cents for the companies. The municipalities realize a very large profit on an average 2-cent fare for the whole group of local authorities operating their tramways, while the companies have a much higher cost and obtain a smaller profit in spite of an average fare of nearly 2½ cents.

Concerning fares the *U. S. Bulletin* report says:

The system of graded fares, or the zone system, is universal in Great Britain. It is a heritage from the old private companies. The underlying idea is that the passengers should pay for the distance traveled. The routes are divided into stages upon which a fare of 1 or 2 cents is collected. This fare is repeated when the zone limits are crossed. For the total distance carried the fare may run as high as 7 or 8 cents. The system seems to meet with universal favor and there is no tendency to abolish it for a straight 2- or 3-cent fare.

But while the fare for a long ride may be greater than in some American cities, the average fare paid per passenger is much lower. And it is the average fare that indicates the cost of the service to the rider. It should be noted, however, that no transfers are given on British railways, while in the United States transfers are very generally given on city lines.

The average fares in a number of British tramway (street-railway) systems are given in the following table of data for 1906:

| MUNICIPAL TRAMWAYS | Average fare per passenger | PRIVATE TRAMWAYS | Average fare per passenger |
|--------------------|----------------------------|------------------|----------------------------|
| | Cents | | Cents |
| Glasgow | 1.88 | Dublin United | 2.48 |
| Leeds | 2.12 | Edinburgh | 2.28 |
| Liverpool | 2.22 | Bristol | 2.29 |
| Manchester | 2.38 | London United | 2.88 |
| Sheffield | 1.80 | Norwich | 2.25 |

The following table, taken from my report on British tramways as a member of the Committee of Four, National Civic Federation Commission on Public Ownership, shows the distances given for various fares by the public and private tramways:

TABLE SHOWING FARES AND DISTANCES IN MANCHESTER AND GLASGOW BEFORE AND AFTER MUNICIPALIZATION.

(From "Municipal and Private Operation of Public Utilities," part II., vol. II., pp. 708 and 709; National Civic Federation Report, 1907.)

| MANCHESTER | | | GLASGOW | | |
|--------------------|----------------|--------------|--------------------|----------------|--------------------|
| Company | | Municipality | Company, 1894 | | Municipality, 1902 |
| Distances in miles | Fares in cents | | Distances in miles | Fares in cents | |
| 1.21 | 1 | 0.72 | 1.12 | 1 | 0.58 |
| 2.33 | 2 | 2.10 | 1.80 | 2 | 2.30 |
| 3.08 | 3 | 2.61 | 2.20 | 3 | 3.48 |
| 4.03 | 4 | 3.34 | 2.80 | 4 | 4.59 |
| 5.03 | 5 | 4.03 | 3.20 | 5 | 5.88 |
| 6.06 | 6 | 4.68 | 3.23 | 6 | 6.90 |
| 7.07 | 7 | 5.43 | 4.00 | 7 | 8.11 |
| 8.06 | 8 | 6.45 | 4.00 | 8 | 9.19 |
| 9.38 | 9 | 7.07 | 4.00 | 9 | 10.15 |
| 10.29 | 10 | 7.82 | 4.00 | 10 | 11.07 |

* For 11 cents passengers are carried 11.59 miles, and for 12 cents, 12.93 miles.

1 The Board of Trade figures are not conclusive on this point, however, for the company capitalization includes some buildings and equipment for lines they lease from municipalities, and the returns do not state how much is due to this item.

2 The graded system is not quite universal, for the Municipal street-railways of Hull make a uniform 2-cent fare, and the Sheffield city tramways have a zone system with only two fares, 1 cent and 2 cents. Liverpool also has practically a 2- and 4-cent zone system, but all other tram systems in Great Britain, both public and private, have a complex system of fares graded according to distance. The people like that plan and it suits their habits and economic condition. The most of them could not afford to pay 5 cents for a short ride as our people do.

Taking into account the greater distance given by municipal tramways for each penny and the establishment of halfpenny fares in all the municipal systems covered by the table except that of Liverpool, the total reduction of charges due to the establishment of municipal ownership ranges from 50 to 56 per cent in the cities under consideration. In Glasgow fares were reduced about 33 per cent soon after the city took the line, and 50 per cent a few years later; in Manchester public management reduced fares 50 per cent; in Leeds about 40 per cent; in Sheffield, 60 per cent; in Liverpool, 50 to 60 per cent, and on long routes much more than this; the company fare from the center to the suburbs was twelve cents, while the city made four cents the maximum fare on the same routes. In most cases the traveler gets more for two cents on the municipal tramways than he would have had to pay five cents for on the company's cars.

Prior to the establishment of municipal ownership, the average fares were much higher than they are now and the distances given for a given fare were much smaller. The companies as a railway did not go beyond one mile for a penny basis for their schedules, but the municipalities have increased the average distance from one penny to 2, 2.3, 2.4, and 2.5 miles, and existing companies, following the lead of municipalities, have increased the average penny route to 1.5, and on one line of the London United to two miles. The average charge per mile is below one halfpenny for the municipalities and one penny for the former companies and three farthings for the present companies.

The municipalization of electricity in Great Britain is more difficult to characterize because it is too recent to show large results.

Electricity The supply of electricity is regulated by the Electric Lighting Acts of 1882 and 1888, consolidated in 1899. A company or a city or borough seeking to supply a given area makes application to the Board of Trade for a provisional order. This order is usually conclusive, and is made only after a more or

less exhaustive examination of local conditions, needs; and desires, but it is also necessary for the city or the private company to secure a private act from Parliament confirming the grant. Once secured, however, an order or franchise is generally regarded as exclusive. Only in London has some competition been permitted.

Franchises are granted in perpetuity. In the case of grants to private companies, however, the municipality or local authority is given the right under the Act of 1888 to acquire the undertaking at the end of forty-two years, at the physical value.

The local authorities, however, have power to buy out the undertaking before the expiration of forty-two years, and many cities have done so. In this event, payment must be made for the unexpired franchises. In those cases where the cities have so purchased, they have been compelled to pay a big price for the franchise. Says the *U. S. Bulletin*:

In the city of Liverpool the capital invested by the company was but £264,711 (\$1,288,216), but the city paid £400,000 (\$1,946,600) to acquire immediate possession. Leeds took over a private plant in 1898 for £370,580 (\$1,803,428) whose physical value was but £217,420 (\$1,058,074). Sheffield paid £300,688 (\$1,463,298) for a plant whose physical value was but £124,472 (\$605,743). Birmingham paid £420,000 (\$2,043,930) for a £219,000 (\$1,065,764) plant; and the borough of St. Marylebone, London, was compelled to pay £1,212,000 (\$5,898,198), after arbitration, for a plant whose physical value was but £597,172 (\$2,906,138).

The fact that such high prices had to be paid for franchises stimulated many cities to enter the field and erect their own plants in fear of having the field occupied by a private company. It also led many other cities to buy out existing plants in the early years of their existence in order to anticipate the further increase of the value of their franchises.

The following tables give the facts for 1906. The first is from the returns of the Board of Trade and the Local Government Board for London Plants.

They are taken from "Municipal and Private Operation of Public Utilities," part i., vol. i., of the National Civic Federation Report, 1907. The pages are given for each table. This part of the report was prepared by Dr. Milo R. Maltbie.

PUBLIC AND PRIVATE PLANTS IN LONDON

| | Public | Private |
|---|------------------|-------------|
| Number..... | 16 | 13 |
| Area of supply, square miles..... | 55.5 | 64.5 |
| Population..... | 2,550,228 | 2,225,540 |
| Number of houses..... | 324,492 | 316,081 |
| Ratable value of property in area..... | £16,225,000 | £26,065,000 |
| Capacity of plants, k. w..... | 54,157 | 128,175 |
| Load factor, per cent..... | 17.43 | 16.30 |

| Average price per unit, including meter rentals and bad debts— | | |
| (a) Private supply..... | 3.14d. | 3.76d. |
| (b) Traction..... | | 1.48d. |
| (c) Public lighting..... | 1.94d. | 2.02d. |
| (d) Total..... | 2.89d. | 3.34d. |

In addition to the electric-lighting companies, some thirty power franchises have been granted to private companies for the supply of current in bulk, the idea being to manufacture and sell to large distributors. These are located in populous areas and are designed to sell current to tramways, electric-lighting enterprises, and large consumers. As a matter of fact, in the majority of cases, these private companies have also secured authorization to supply current direct to small consumers.

The next table is from the *Electrical Times* for plants outside of London:

ELECTRICITY UNDERTAKINGS OUTSIDE OF LONDON

| | Public | Private |
|---|-------------|------------|
| Number of undertakings..... | 196 | 70 |
| Board of Trade units sold..... | 391,324,269 | 65,819,781 |
| Average sales per undertaking in units..... | 1,996,552 | 940,283 |
| Capital expenditure at end of year..... | £28,884,748 | £6,454,908 |
| Capital per plant..... | £147,371 | £92,214 |
| Capacity of plants in k. w..... | 405,953 | 72,842 |
| Average capital per k. w. capacity..... | £71.2 | £88.6 |
| Average per undertaking, k. w..... | 2,071 | 1,041 |
| Capital per unit sold..... | 17.7d. | 23.5d. |
| Maximum load in k. w..... | 258,102 | 44,773 |
| Load factor, per cent..... | 17.31 | 16.78 |
| Revenue from electricity supply..... | £3,677,320 | £576,525 |
| Average revenue per unit sold..... | 2.25d. | 2.10d. |
| Revenue from meter rents and other sources per unit sold..... | 0.06d. | 0.21d. |
| Total revenue..... | 2.31d. | 0.31d. |
| Operating expenses per unit..... | 1.06d. | 1.18d. |
| Gross profit per unit sold..... | 1.25d. | 1.13d. |
| Percentage of gross profit to capital, per cent..... | 7.07 | 4.82 |
| Depreciation or sinking-fund per unit sold..... | 0.47d. | 0.19d. |
| Percentage of depreciation and sinking-fund to capital, per cent..... | 2.69 | 0.8 |
| Net profit per unit sold..... | 0.78d. | 0.94d. |
| Percentage of net profit to capital, per cent..... | 4.38 | 4.01 |

The rates charged by the public undertakings are usually below those of the private companies. An opportunity for comparison of results is offered by the public and private enterprises operating in the metropolitan area of London. Fourteen undertakings are in the hands of the local authorities, and 15 are operated by private companies. These enterprises operate in different parts of the city. The average rates charged by 12 of the local authorities reporting was 3.17d. (6.44 cents) per kilowatt hour. The average production cost per unit for the same boroughs, not including interest and sinking-fund charges, was 1.68d. (3.41 cents). The average price obtained by the 15 private companies was 3.45d. (7 cents), and the average working cost was 1.66d. (3.37 cents).—(*Electrical Times*, of London, an authoritative trade publication. Aug. 17, 1905.)

The third statement is from Garcke's *Manual*, a high corporation authority. This table covers the whole United Kingdom:

GARCKE'S TABULATIONS FOR 1904-5

| | Public | Private |
|---|-------------|-------------|
| Number of undertakings..... | 182 | 71 |
| Number of units sold..... | 356,759,088 | 166,101,141 |
| Average number per undertaking..... | 1,960,215 | 2,372,873 |
| Revenue from sale of current per unit sold..... | 2.44d. | 3.12d. |
| Total revenue from all sources per unit sold..... | 2.57d. | 3.39d. |
| Total operating expenses per unit sold..... | 1.21d. | 1.59d. |
| Trading balance per unit sold..... | 1.36d. | 1.79d. |
| Bad debts and special charges per unit sold..... | 0.06d. | 0.03d. |
| Sinking-fund, depreciation, or reserve per unit sold..... | 0.64d. | 0.3d. |
| Net profit: For interest, investment in plant, or payment to the city by public plants; or for interest and dividends by private plants..... | £998,620 | £1,009,029 |
| Ditto, per unit sold..... | 0.66d. | 1.45d. |

The plants of the private companies are much larger than those of the local authorities, the former having an annual revenue of £1,498,717 (\$7,293,506), as against £400,668 (\$1,949,851) of the latter. If any advantage existed it was therefore on the side of the private enterprise.

It will be noted that the average price charged by the private companies is nearly 30 per cent higher than the average charged by the municipal systems, and that the operating cost per unit sold is more than 30 per cent higher for the companies than for the municipal plants. The capitalization of the public plants per unit sold is consider-

ably lower in the municipal plants than in the company systems. The public plants put twice as much into sinking-funds, depreciation, and reserve, and do not have to pay out in interest and dividends nearly as much per unit as the companies. Under municipal operation the public gets the benefits which under private operation go to the small body of stockholders.

Of other forms of municipal ownership the *U. S. Bulletin* says:

In various places it has come to include municipal dwellings (q. v.), docks, markets, and baths, race-courses, oyster fisheries, slaughter-houses, milk depots, employment bureaus, and sewage farms. The Brighton corporation owns the local race-course, from which it derives a revenue of from \$10,000 to \$15,000 a year. Municipal theaters have been opened at Brighton and Southborough. West Ham manufactures its own paving-stones and sells them to contractors at a profit. Colchester has a municipal oyster bed. Manchester produces soap, oil, tallow, and mortar as residuals from its gas and other industries. Many cities supplying gas deal in stoves and gas fittings. Others, dealing in electricity, wire the houses and supply them with fittings. Southport and Bradford are advocating municipal tailor-

ing establishments to manufacture the uniforms of town employees.

In some of the northern districts of Great Britain proposals have been advanced that the municipalities should buy up coal-mines for the supply of their industries and the relief of consumers. Municipal insurance schemes are finding favor, and there is considerable agitation in behalf of municipal savings-banks and brokerage establishments for the disposal of local securities. A number of cities supply sterilized milk for children, and the ultimate municipalization of the entire milk-supply is being urged. Glasgow maintains an institution for the cure of inebriates. Wolverhampton sells ice to the traders of the town. Most of the cities own markets which yield a large revenue. Torquay breeds rabbits on a water preserve and enjoys therefrom a revenue in reduction of the rates; the city has also undertaken sheep-farming. Tunbridge Wells grows hops for sale. Liverpool cultivates beets. Many cities operate large sewage farms on which are grown supplies for the fire, police, and other departments. The town council of Glasgow has acquired a number of large halls where concerts and entertainments are given. Music in the parks is very generally provided in a number of cities. Baths have been established in many towns.

In Great Britain, as in America, free libraries, schools of art, museums, and technical schools are widely promoted.

Concerning the important matter of administration, it must be remembered that for all municipal activities in Great Britain the town council is the supreme legislative and executive authority. It is a large body, its members elected for three years, who in turn elect a limited number of aldermen for a longer period. The

Administration

mayor is also chosen by the council from its membership with the town clerk, who enjoys large powers. He is the city solicitor, is highly paid, and is an expert official. The members of the council serve without compensation.

The council is divided into large committees, which exercise all of the executive powers reposed in the American mayor and heads of the departments. Through the committees, subject to confirmation by the council, the managers, engineer, and higher administrative officials are chosen. Subordinate employees are appointed by the manager, who is held responsible for the administration of the undertaking.

The merit system prevails in all city employment. It is not enforced by law, but by custom and public opinion. Tenure of office is for good behavior and efficient service. Neither is there a spoils system.

To a considerable extent managers are chosen because of their administrative rather than their engineering skill. Competent engineers are employed by the managers.

The annual reports of the enterprises are very elaborate. They give the administration of the undertakings in detail and are annually presented to the council in printed form. They are widely quoted by the press and carefully studied by the public, who show an intimate acquaintance with the transactions of the council. In many cities, possibly in most of them, membership in the council is highly prized and eagerly sought after. It involves an immense amount of labor, but a corresponding appreciation from the community.

The *U. S. Bulletin* gives the following reasons for the success of municipal ownership in Great Britain:

1. The traditional distinction that attaches to the public service in Great Britain.
2. The magnitude of public work and the importance of municipal enterprise. This makes the town council an attractive field for the business or professional man of ability and the character of the council a matter of interest to all classes. The taxpayer and the voter feel that their interests must be properly cared for.
3. The absence, or at least the subordination, of partisan spirit in local matters and the elevation of the city's welfare over all other issues.

4. The method of nominating candidates by petition rather than by party machinery, the election of councilmen at a separate election when no other issues are before the people, and the limitation of the candidates before the people to the two or more nominees from the ward; for the British elector (aside from the poor board) has but two officials to vote for—a candidate for Parliament and a candidate for the town council. The issue before him is always clear and distinct. To this should be added the fact that there is no organized class that wants anything from the city but good government. There are no franchises to grant, no privileges to give away. In addition, many cities do most of their work by direct labor rather than by contract. They pave the streets, build sewers, construct tram-cars, even build engine-houses and model dwellings by direct employment under the city engineer. There is thus no class whose interest desires the election of either partisan or venal officials. There is no interest that can be organized and no class whose pocket is at war with its civic obligations.

This interest is still further promoted by the fact that every voter is a taxpayer. This, or the possession of real property, is the qualification of the suffrage. Even a lodger can vote, if he pays a certain sum each week, but the predominant element in the English electorate is the taxpaying class. This is almost equivalent to universal suffrage. But the rates or taxes, instead of being imposed on property as such, are imposed on the rental paid. It is a sort of local income tax. The tax is paid largely by the tenant. As a means of stimulating interest in local matters, it is eminently successful. It is this pecuniary interest in every act of the council; it is the hope of gain or the fear of loss, as much as anything else, that explains the jealous watchfulness of local affairs by the public.

The results of the investigation carried on by the National Civic Federation on public ownership during the last two years fully confirm the conclusions expressed by Dr. Howe in the *U. S. Labor Bulletin* quoted above.

While the Commission was in London the Right Hon. John Burns, President of the Local Government Board, which has general supervision of municipal affairs, granted us an audience, and one of the most striking parts of the interview was when he read the following passages from the *Labor Bulletin* and said, "That is a true statement of the results of municipal ownership in this country." Here are the paragraphs he read:

The municipalization of the street-railways was rendered the more natural by virtue of an act of Parliament, passed in 1870, known as the Tramways Act, which authorized the local authorities to lay tracks and then lease them to a private company for operation. At the end of twenty-one years the cities had power to operate the enterprise themselves. Such

Rise of the Movement

leases were very generally made in the "seventies" and "eighties," and the systems were worked as horse-car lines. The private companies rarely, if ever, equipped them with electricity. During the last ten years these leases have been terminating. Coincident with their termination electricity began to be generally recognized as the proper method of propulsion. These two facts—the short-term franchises, together with the application of electricity to street-railway operation—made it an easy as well as a natural matter for the cities to enter the field.

The act of Parliament authorizing electric light and power enterprises unexpectedly operated in the same way. All franchises or working powers for private corporations must be obtained from Parliament; they cannot be granted by the town council. The cities have no legal control over franchises, except in the case of street-railways, and even in this case it is of a negative sort. The Electric Lighting and Power Act gives the private companies franchises which are virtually exclusive for forty-two years. When private corporations sought powers to operate, the cities rushed to Parliament to prevent them. In order to do this they had to get the powers themselves; but to hold the powers they had to act. Hence some towns erected lighting-plants in order to escape being turned over to a private company. Other cities, like Liverpool, Sheffield, and Birmingham, permitted private companies to enter unopposed. They soon saw the business growing rapidly. As the enterprise became established the franchises increased in value. Many towns, feeling that the business must be eventually taken over, and seeing that the franchises were increasing in value from year to year, entered into negotiations with the companies, and paid immense sums for the franchises in order to anticipate their further increase in value.

For a fuller statement of the facts relating to municipal ownership in Great Britain the reader

is referred to the papers by Prof. J. R. Commons, Prof. E. W. Bemis, Dr. M. R. Maltbie, and the present writer in the report of the Civic Federation Commission, dated 1907.

On the subject of municipal ownership in general and the leading divisions of the topic, the reader will find full information in the books referred to under the heading of "Public Ownership," especially the *Municipal Monopolies*, *The City for the People*, the *Municipal Ownership*, number of *Municipal Affairs*, the *Annals of the American Academy of Political and Social Science*, and the discussion of *Public Ownership of Transportation* in vol. ix. of the *Report of the U. S. Industrial Commission*. FRANK PARSONS.

MUNICIPAL PROGRESS IN THE UNITED STATES, RECENT: Americans can no longer, in the light of the events of the past few years, be justly charged with indifference to municipal problems and their solution. The two years just passed (1905-7) have outstript all others in practical municipal progress. Heroism, heretofore largely an incident of military activity, is now in large degree manifested in civic endeavor.

Secretary Root's letter to Mayor Weaver of Philadelphia, written after the former had accepted the State portfolio, in which he denounced

**Dis-
tinguished
Examples**

"the criminal combination masquerading under the Republican name" as constituted of traitors alike to the great party whose name they had filched and to the interests of the community; the address of Secretary Taft in the Ohio campaign in which he declared that were he to vote in Cincinnati he would vote against the ticket nominated by the Republican boss there; the independent attitude of Secretary Bonaparte in the Maryland campaign; the conspicuous position taken by former Postmaster-General Smith in the Philadelphia revolution; the eminent public services of former foreign ministers Wayne MacVeagh and William Potter (the latter running as mayoralty candidate on an independent ticket) in the same connection—all have tended to reinforce the contention so long maintained and insisted upon by the National Municipal League that national parties and national questions have no proper connection with the determination of local issues. This disregard of party lines in local elections and the independent spirit manifested by the electors constitute the most significant developments of the year 1905-6 and indicate clearly the growth of public sentiment along these lines.

The New York and Philadelphia campaigns in Nov., 1905, have occupied a large degree of public attention throughout the country, not only because of the issues involved, but because of their picturesque elements. Just when the election seemed to be a foregone conclusion and opposition to the will of the bosses of the Democratic and Republican machines seemed hopeless, District Attorney Jerome, who had been denied a nomination alike by the Democrats, the Republicans, and the Municipal Ownership parties, determined to give to the voters of New York County an opportunity to express their wishes as to whether or not he should be accorded another term, running upon his record only.

His reelection without any formal party indorsement, tho he did have the Citizens' Union back of him, was a significant success. Mr. Hearst

on the Municipal Ownership ticket was equally spectacular, and in spite of unpleasant stories widely circulated and believed, the enthusiasm for him was evidently due to the sincere and earnest belief on the part of many thousands of voters that neither of the old national parties could be trusted to protect the city's interest in the face of the inducements offered to the leaders of those parties by large public corporations.

The election-day proceedings were most discreditable, according to the testimony of competent observers, and the arrests and convictions secured are said to give an inadequate idea of the amount of fraud at the polls. There has been a dispute ever since the close of the election as to the honesty and regularity of Mr. McClellan's election. We have, therefore, the remarkable situation of having in the mayor's chair for four years a man who was very far from receiving a majority of the votes cast and whose plurality it was declared would not stand the verification of a recount. The fact that the people of Greater New York have quietly acquiesced in this paradoxical result speaks volumes for their spirit of obedience to the spirit and the letter of the law.

The 1907 session of the New York Legislature has passed two recount bills, at the instance of Governor Hughes.

For eighteen months (May, 1905-Nov., 1906) Philadelphia was the scene of one of the most far-reaching municipal revolutions witnessed in any American city. After years of misgovernment and mismanagement and a degree of corruption which astounded even those fairly familiar with the situation, Mayor Weaver, with an independent indorsement, not only broke the shackles which had held him to the Republican organization, but inaugurated a campaign which, for the time being, broke up the organization. The immediate cause of his break was the introduction of an ordinance providing for the extension of the existing lease of the gas-works for seventy-five years in consideration of a lump payment of \$25,000,000, notwithstanding the fact that the present lease (which had about twenty-two years to run) would yield the city something over \$37,000,000 before its expiration. The result was that the elections of Nov., 1905, and Feb., 1906, were carried by the Independents (the City Party); there was called an extraordinary session of the legislature, which passed a remarkable series of reform acts, and the Republicans were forced to place in nomination for governor a man who was pledged to investigate the capital scandal, and who is doing it, and in other ways repair their previous delinquencies. (See PHILADELPHIA.)

The influence of the Nov., 1905, election in Philadelphia was largely felt in the February elections in other parts of Pennsylvania. George W. Guthrie, for many years a stalwart worker in the ranks of municipal reform, was elected by a substantial majority as the representative of the independent forces to be Mayor of Pittsburgh.

The political situation in Scranton, Pa., has been somewhat different from that of many other places. The efforts of the Municipal League have so greatly changed conditions that the city has been singularly free from the various "fashionable" forms of municipal corruption. Since eighteen councilmen were prosecuted by the league a few years ago, boodling in the councils and other public bodies, if practised at all, has been ex-

ceedingly rare, and limited in scope and most carefully concealed.

The reelection of Mayor Cutler in Rochester was a well-deserved tribute to a faithful official who had administered his office with an eye single to the best interests of the community and without reference to political considerations.

Buffalo, in national politics Republican, elected a Democrat to the mayoralty chair because of his known fitness for the office. The majority for Mayor Adam, who had served efficiently in the board of aldermen, was so large that it carried his whole party ticket, and so displaced the existing Republican régime. At the same election the city voted in favor of owning and operating an electric-lighting and power plant. An interesting feature of the election was, that out of a total vote of 65,000 for the mayoralty candidates, only 9,641 votes were cast on the last-mentioned proposition, 7,691 being in the affirmative, 1,950 in the negative.

In New Jersey the recent significant events have been the campaign of Senator Everett Colby and the reelection of Mayor Fagan of Jersey City. Senator Colby has made his fight within the Republican Party, and at a direct primary overwhelmed the forces of the boss. While he has not thus far accomplished all he has aimed for, he is forcing the issues all along the line and has introduced new standards of public action and political activity.

For years Jersey City has been normally Democratic; but Mayor Fagan, a Republican, has been three times chosen to the mayoralty; and he owed his last reelection to his independent action, he having openly defied the party bosses upon both sides, altho he received the formal nomination of the Republican convention.

While Cleveland, Ohio, still retains its character as a Republican city, Tom L. Johnson has been thrice elected mayor, his last majority (12,000) being the largest ever given in the city for mayor, and about twice the majority secured by him in his previous campaigns. The Municipal Association of Cleveland indorsed Mayor Johnson for the first time. Lincoln Steffens had described him as the best mayor in the U. S.

Toledo elected another non-partizan mayor in the person of Brand Whitlock, and gave him what it failed to give the late Mayor Samuel M. Jones—substantial support through the election of sympathetic candidates to the local council.

Indiana cities (outside of Indianapolis) have been having their first experience with a new municipal code, introducing the federal plan. This change has been marked by a great awakening of interest in municipal affairs and reform throughout the state. Communities wholly given over to the lowest forms of machine politics and corrupt government have developed a new form of public opinion in the belief that it would find an effective instrument in the new kind of government. Reform clubs have been organized in many of these cities. The misuse of public funds by officers charged with their collection or custody has also aroused public interest. Governor Hanly has astonished his partizan friends by showing the spirit of a reformer. He has appealed to public opinion throughout the state to abolish these abuses, and has set the pace by investigating the accounts of state officers. In a short time he forced the auditor of state and the secretary of state to resign their offices; the former, an influential politician, was indicted for embezzle-

ment and found guilty. In Indianapolis the reformers were defeated at the polls in the election of mayor, but their defeat was not disheartening, as the normal Republican majority of 12,000 was cut down to 1,500.

Chicago continues to attract a large share of public attention. Its municipal experiences are varied and illuminating. It is often difficult to form a positive conclusion as to the meaning of many of the things that have been done there. The street-railway question, which for a decade has been a burning issue, has been settled by the passage of an ordinance which received a majority of upward of 40,000 when submitted to the elector as a referendum. Competent observers and critics like Walter L. Fisher, who for years was secretary of the Municipal Voters' League, and who was traction adviser to Mayor Dunne, promoted and supported the ordinance as a satisfactory solution of the problem.

The city after many years of agitation has at last got some reduction in the price of gas. The legislature at its 1905 session authorized the city council to regulate the price, and this body reduced the charges from \$1 to eighty-five cents per thousand feet. While the reduction was not sufficiently large to satisfy many elements in the community, it is generally considered as establishing a useful precedent.

The Municipal Voters' League continues a potent factor in the selecting and election of honest councilmen and this past year it has added efficiency to its standards. The success of the Municipal Voters' League has had a far-reaching effect; its contest with the street-railway corporations and its effort to settle that problem were followed with extreme care and breathless interest by municipal observers everywhere. Its fight for a high license and its gas contest are likewise the subject of thoughtful consideration. At the present time it is giving careful attention to another important problem. A charter has been prepared and was submitted to the voters in Sept., 1907, to bring the city in harmony with modern needs.

The most important recent event in Michigan has been the vote on the proposition to hold a constitutional convention. The proposition was carried by a large majority on a rather light vote. The Detroit Municipal League will make an active campaign in favor of a non-partizan convention, insisting that candidates in each district be nominated by petition and their names placed on the ballot without any official party designations.

The progressive elements are mainly bent upon securing municipal home rule and the initiative and referendum. There is also a great deal of discontent with the present system of taxation, and the proposed constitutional reforms fall into two classes: first, local option in taxation; second, the elimination of the uniformity clause and other provisions which prevent the separation of state and local revenues. The railroads are likely to try to overthrow the constitutional amendments secured several years ago by the late Governor Pingree, providing for the assessment of railroad property by a state board and its taxation at the same average rate as is applied to other property in the state as assessed by local assessors.

Mayor Rose of Milwaukee has gone down to defeat after four successive elections. His repeated successes tended to create a feeling that he was impregnable; but Milwaukee felt the effect of the reform movement, and in April, 1906,

chose Alderman Becker, a young man of vigorous personality. An interesting feature of the campaign was the praise which Mayor Rose, a Democrat, bestowed upon the Republican boss. Alderman Becker, altho the Republican candidate, had won his nomination without the support and cooperation of the Republican managers, who were generally believed to be interested in Mayor Rose. This tendency to split the ticket appeared on all sides. The recommendations of the Municipal Voters' League of Milwaukee were very generally regarded.

Minneapolis has been a center of interest. In the autumn of 1905 Mayor Jones decided to close the saloons in Minneapolis on Sunday. The order was issued on Oct. 31st, and went into effect on the following Sunday. It was strictly enforced and obeyed by the saloon-keepers without much show of resistance.

As president of the council it was also his duty some years ago to assume the office of mayor and fill the unexpired term of the notorious Ames when he was driven from power by the police investigation which made Minneapolis famous, and for a time infamous. During the first year of his administration he reorganized the police department on a non-partizan, voluntary civil-service basis, and vastly improved both its personnel and its discipline. Grafting in any degree meant dismissal. At the urgent insistence of his friends he became a candidate to succeed himself, as there was no one else who represented the issues that he had raised, and the fight was on these issues. He won out at the primaries, where the corporation and saloon forces united against him. This fight was carried to the polls, the elements who had opposed him at the primaries supporting his Democratic opponent, and he went down to defeat by a very narrow margin, but with the respect of every one as an honest and efficient official.

The situation in St. Louis continues to be on the whole encouraging. While there has been no decided progress in municipal affairs, the city continues to enjoy the services of an honest mayor and an honest council. The revenues of the city have been greatly increased, the streets are kept clean, and intelligent efforts are being made to solve in the interests of the people the many and perplexing problems which confront the officials of every city. Governor Folk has given better boards for the local control of the police, excise, and election; and excellent work is being done by them, but there is still considerable feeling on the part of a large portion of the community that these boards should be in the hands of the local authorities and not subject to the dictation of some future governor who may or may not be interested in securing good government.

The 1906 election in Kansas City resulted in a great victory for the good government forces, the choice of Henry M. Beardsley to the mayoralty being one of the most satisfactory events of the year. He has had long experience in dealing with municipal questions, and as president of the Board of Public Works had charge of the rehabilitation of the water-plant, as well as other public improvements, involving the expenditure of many millions of dollars. The results in other directions were equally satisfactory, the voters exercising a large degree of independence and very generally abiding by the indorsements of the Civic League.

Louisville has furnished "a horrible exam-

ple," altho its public-spirited citizens who are actively engaged in devising ways and means for the relief of the city deny that "Louisville is hopelessly and helplessly corrupt." For years the city has not had an honest election, and that held on Nov. 7, 1905, was as bad as any election held anywhere where there has been great corruption. It was confidently asserted that the records would show that every crime against the ballot that could be committed was committed during the two days of registration and on the day of election, an opinion which has received official sanction at the hands of the Supreme Court of the state. Immediately after the election in question a contest was instituted to determine whether the mayor and those who were chosen at the time had been honestly elected. The lower court determined that they had, but the Supreme Court overruled it and ousted the mayor and sixty-two other officers and in a scathing opinion denounced the fraud which had been practised and sustaining the reformers in their every claim.

In Iowa and Colorado the municipal elections are coming to be determined in most instances on local issues. Seattle has also joined the ranks of cities settling local issues on a local basis. Its present mayor was elected by a small majority as an independent, over the candidate of the dominant party's organization. The particular issue involved in the fight was municipal ownership, altho general dissatisfaction with the existing condition of affairs was an important factor.

Mayor Ballenger, the predecessor, gave to Seattle a conspicuously good administration. Under his guidance the city made a material development in conditions relating to better government from the standpoint of morals as well as from that of public efficiency. Not only was the question of the introduction of transcontinental railroads settled, and the construction of a garbage-destruction plant authorized, but the completion of a municipal electric-lighting plant was undertaken, and the public service greatly extended throughout the city. Public improvements representing a very large expenditure of money were inaugurated. But he declined re-nomination.

In Portland, Ore., the reform forces have made substantial advances in every direction. The most marked improvement noticeable has been in the granting of franchises for public utilities. This is now being done very cautiously and prudently, and the city is getting substantial value for all of its franchises, with rights of inspection, publicity, and reversion to the city that are decidedly a marked improvement upon the loose methods of old times.

The operation of the new direct primary law is being watched with care. Those who are most competent to express an opinion are certain that the new law has destroyed the old rings and cliques. Its most serious defect, according to some observers, is that it makes office almost entirely a self-seeking operation; that is, under no ordinary circumstances can the office seek the man, but the man has from the beginning to work for the office. This is regarded as an encouragement to people who desire notoriety and who are willing to pay for it, and a discouragement to the self-respecting, dignified, and oftentimes shrinking citizens. The Democratic Party, which by reason of its situation has been a beneficiary of the reform movement, held what

Primary Law

was practically a convention and discust ways and means for presenting the names of responsible citizens for selection at the primaries. In this way it is expected that the benefits of the old and new systems will be secured.

San Francisco is another "horrible example," the candidates of the independent citizens having

San Francisco

been to a man defeated. This city presents a situation unique in the annals of American municipal history, in that a short time ago one boss, the so-called labor boss, controlled the three leading parties—the Republican, the Democratic, and the Labor. Vigorous efforts were made at the Republican and Democratic primaries to throw off the yoke, with little avail. Finally, the leaders of the Republican and Democratic forces determined to disregard partizan politics and to unite upon a single ticket to represent the best interests of the city. The boss retained his hold upon the Labor Party, however, and by a shrewd, altho unscrupulous appeal to class prejudice, was able to elect his entire Labor ticket. The victory did not represent a triumph of those principles wherein the best elements of organized labor are most profoundly interested, but simply the capture of the title by designing men for their own ends. The result of the election is now generally conceded, however, to have been caused in fact by the voting-machines. These worked successfully so far as the mechanical part was concerned, but as it was the first time many of the voters had ever used the machine and did not understand it very well, there is no doubt that many thousands voted straight tickets, as that was the easiest course to pursue, who otherwise would have split their tickets.

The recent developments by which the mayor thus elected has been convicted of extortion and sentenced to five years in the penitentiary and the aforetime all-powerful boss has pleaded guilty to similar charges, in fact redeemed the city. Los Angeles has a new administration which is giving satisfaction in nearly every department, and it has a municipal league, which, like the Chicago league, has become a great factor in the city's growth in decent and administrative efficiency.

The war on graft throughout the U. S. is being preste with great vigor and with greater rapidity. There is practically no community in the country where the municipal problem is at all serious but has had its investigations or inquiry, and consequent exposures and prosecutions. In Pennsylvania the malodorous state capitol scandal is being probed to the bottom, and its long list of frauds, deceptions, and malversations are being brought to light and it is confidently expected that those responsible for them will be brought to book.

The War on Graft

In New York the insurance disclosures occupied the center of observation for a long time and affected the political situation there to the extent of electing Governor Hughes and defeating the rest of the Republican ticket. The Ohio State Senate sent a committee to Cincinnati, which joined in "the revolt against venal bossism and municipal corruption," to investigate and expose the methods by which the machine secured and retained its power. It only took the committee one day to unearth one form of graft which yielded from \$15,000 to \$20,000 a year to the boss's lieutenants. The county commissioner testified that he collected taxes annual-

ly amounting to about \$7,000,000, mostly in the form of checks, which were deposited in the various banks. This money was allowed to remain certain definite times after collection, in return for which favor banks presented him with a gratuity, which he frankly confest he accepted as a perquisite of the office, the city receiving nothing on the deposits in the way of interest.

In Allegheny a series of prosecutions resulted in the conviction of a number of office-holders for various crimes against the public welfare.

In Pittsburg a councilman and a broker have been convicted of bribery in connection with an important franchise, and other suspects are about to be tried.

Milwaukee has witnessed a long series of prosecutions and convictions. Up to a recent date twenty-one defendants had either been convicted or pleaded guilty, and six had been acquitted.

At the time of the convening of the California Legislature in 1905 there was considerable newspaper gossip to the effect that certain building and loan associations were being grossly mismanaged, and special attention was called to the affairs of one. A legislative investigation of the association was demanded, and the Senate appointed a committee of seven senators, four of whom privately formed a plan by which they could investigate the association and make money out of it. They selected a go-between to approach the officers of the concern and ascertain whether it would be willing to pay for stopping the investigation. They profest to be willing to do so, but quietly set a trap to catch the senators, the sum of \$1,400 being agreed upon as the price to be paid. In the mean time the committee proceeded to summon witnesses to hold the farce of an investigation. The officers of the association refused to respond to the subpoenas of the committee and were cited to appear before the Senate to answer for contempt. They appeared before the Senate and then and there disclosed the whole proceedings and accused the four senators of soliciting and receiving bribes. The go-between confessed his complicity and the Senate appointed a committee, which refused to allow the accused to testify under oath, owing to the clause in the law which exempts a person who testifies in a case of bribery from further punishment. The Senate then reported the accused to be guilty and recommended their expulsion from the Senate, which was unanimously done. The grand jury of Sacramento County shortly afterward found an indictment against the four senators, one of whom turned state's evidence, and all have since been convicted.

These instances are cited not because they constitute all that has been accomplished along these lines during the past year, but as typical of what is being done in nearly every important community in the land.

The central West continues to be the storm-center of municipal reform activity, with New York and Pennsylvania pressing closely and the Western Slope municipalities not far behind. During the past few years there have been fewer incidents of importance or interest in the New England and Southern states, the principal events having been those already mentioned herein, tho there is no lack of signs of abundant life in the leading New England and Southern communities.

There have been many important improvements of far-reaching character undertaken by

the municipalities of the U. S. Mention must be made, if only briefly, of the project to expend \$25,000,000 for the improvement of the water-supply of Los Angeles; of the publication of Daniel H. Burnham's plans for the improvement of San Francisco, called most aptly by those in charge of the matter "San Francisco's new civic charter"; his similar plans for Chicago; the reports for the reorganization of Denver, Colo., and Columbia, S. C.; the inauguration of Chicago's neighborhood center and outer park systems; the establishment of the municipal museum in the same city; the very remarkable progress now under way in Washington along local lines.

Municipal Improvements

Harrisburg, which for the last four or five years has occupied so much of the public eye because of the successful execution of its far-reaching plans for civic improvement, continues its good work.

The question of public utilities in many communities has in many places overshadowed all other questions. It has been the one municipal issue in an increasing number of communities upon which the people have felt and expressed a decided opinion. In Chicago the street-railway situation was the burning question during all of Mayor Dunne's administration.

Municipal Ownership

In Boston they have occupied a large share of attention, and the settlement of the gas question has been conspicuously to the front. Its settlement along lines satisfactory to the best interests of the city is due almost entirely to the public-spirited activity of the Public Franchise League, and of organizations that have cooperated with it. The Seattle election turned upon the question of municipal ownership. The great vote cast for Mr. Hearst in the Nov., 1905, election in New York was due to public interest in it. In Denver, in Lincoln, Neb., in San Francisco, in Philadelphia—in fact, in a long list of cities these questions have been actively to the front.

Chicago cast another vote in favor of municipal ownership, altho it failed to cast the necessary three fifths to enable the councils to proceed at once to operate the street-railways; but on the advisory question of public policy the city authorities are forbidden by a majority vote to grant any franchises, and the city has been authorized to issue certificates under the Mueller Law not to exceed in amount \$75,000,000. In Kansas City both the Republican and the Democratic platforms declared for the principle of municipal ownership. Cleveland is gradually entering upon a policy of municipal ownership and operation, having recently appropriated \$40,000 for the extension of the municipal lighting plant. In New Jersey the movement for limited franchises is making substantial headway. The action of the Newark Board of Trade indicates very clearly the trend of public sentiment there, it having recently adopted a resolution favoring the enactment of a law to prohibit the grant by any municipality of any special privilege in the public streets for a longer period than twenty-five years, the property used in the exercise of the grant to revert to the municipality at the end of the period, and then to be offered for a further period at public auction and granted to the bidder offering the best terms. The investigation of the subject undertaken by the National Civic Federation has attracted general attention.

There has been no diminution of interest in the

subject of nomination reform. A very interesting conference on electoral reforms was held in New York City in March, 1906, under the auspices of the National Civic Federation, and the development of public sentiment in favor of uniform direct primaries was shown to be rapidly increasing. Pennsylvania, as a result of the political revolution of the past year, has now a fairly satisfactory law, which will eliminate many of the features which have made machine domination in that state easy of accomplishment. The subject is a burning one in Oregon and Washington, as also in Minnesota, Wisconsin, and Illinois—in fact, in all the central Western states. The Minnesota law continues to give general satisfaction.

There is a growing sentiment in favor of legislation on the subject of the prevention of corrupt practices at elections. This topic was considered very thoroughly at the National Civic Federation's conference, and a number of bills on the subject are now pending in various state legislatures.

In the matter of charter reform, an interesting bill was introduced into the Massachusetts Legislature which, if it had been enacted into law, would have marked an important step forward and furnished an interesting experiment in the effective co-ordination and organization of adjacent municipalities with common

Charter Reform

interests but separate governments. This measure, known as the Metropolitan District Council Bill, provided that the chief magistrates of the cities and the chairmen of the boards of selectmen of the towns that are now or may be included within the metropolitan park, water, or sewage system of Boston shall constitute the Metropolitan District Council, to which the several commissions and boards should annually in the month of January submit reports of the work performed and the money expended by them during the preceding year, together with detailed estimates of the amounts required for the ensuing year. This council must vote by a roll-call of municipalities and towns on the question of approving or disapproving all proposed legislation involving appropriations of money for park, boulevard, water, or sewage purposes; but only those municipalities shall vote which have a financial interest as contributors in the proposed expenditure of money. This council must also submit to the legislature from time to time reports, with its recommendations, on the various questions of metropolitan work which have been brought before it; and in all cases where votes have been taken, such reports shall contain a full record, giving the names of the municipalities which have favored and those which have disapproved of each proposition. Thirty-nine municipalities were interested in this measure and came within its scope. Their combined area about equaled that of the city of Greater New York, with an approximate population of 1,400,000.

The Galveston plan of government continues to excite general attention. It has produced such admirable results through conscientious, faithful administration in the city of its origin that it has been copied in other Texas cities, and has been considered in other states, notably in Iowa, where the Des Moines adaptation has been devised, and will be put into execution next year (1908).

Municipal officials continue their activity in behalf of more efficient administration and

higher standards. The League of American Municipalities, the American Society of Municipal Improvements, and the various state leagues continue helpful work along educational lines. The organization of the League of Virginia Municipalities is to be noted with interest as a very satisfactory development in a leading Southern state. The Michigan and Iowa leagues have taken the initiative in a movement for uniform accounting and are doing yeoman service. Another class of officials is constituting itself an important factor in municipal progress; that is, the auditing and accounting officers who met in Feb., 1906, and again in Chicago in 1907, to consider the question of the uniform classification of municipal accounts and comparable municipal statistics.

A movement of the greatest promise is the formation of city government clubs in our educational institutions. The Yale City Government Club, which has done excellent work in this behalf, called a conference of similar organizations, which was held in the city of New York, and the Intercollegiate League of College Good Government Clubs formally organized.

Of somewhat similar import has been the interest manifested in politics by various bodies of young men, notably those banded together in the Young Men's Christian Associations.

Numerous local associations are organizing good government courses and are seeking in various ways, on the one hand, to interest their members in municipal problems, and on the other hand to educate them to intelligent activity.

CLINTON ROGERS WOODRUFF.

MUNICIPAL REFORM (for the history, statistics, and government of cities, see CITY. For the reform of cities on lines of municipalism, see MUNICIPALISM. For the most important cities, see those cities. See also CORRUPTION; MUNICIPALITIES, GERMANY; MUNICIPAL HOUSING; MUNICIPAL OWNERSHIP; MUNICIPAL PROGRESS; MUNICIPAL TRADING): We consider in this article the movements and societies for municipal reform which have sprung up in all the larger American cities on somewhat varying lines, but in general sympathy both as to aims and methods, and now federated in a National Municipal League.

Spasmodic efforts and uprisings of indignant citizens against some extreme display of municipal corruption or mismanagement have long been known in America, but have accomplished little permanent and not even much temporary good. It was a fight of unorganized volunteers against organized regulars.

Needs

Usually the result was that the reformers, after a passing effort, gave up the battle as hopeless, or, having won a passing victory, retired to let the enemy immediately regain all that had been won. The thought of the new municipal movement has been that our cities can only be rescued from evil by the permanent organization and continued watchfulness of the forces of good. This thought has been helped by a growing ideal on the part of some of the true city life. The general tendency in America has been to despise government and magnify private action. The natural result has been that governments, and especially our municipal governments, have been left, generally speaking, to our more ignorant citizens, while the abler and more educated classes have largely left politics alone. The evil of this having been seen, there has been a growing willingness of able

men to devote time to city problems, and even to accept office. Among the first examples of this were the election of Mr. Seth Low as Mayor of Brooklyn, the mayoralty of Mr. Hewitt in New York, the early activity of President Roosevelt in the same city. But this was soon seen not to be enough, and that there was a necessity for organizing against corruption.

Such an organization was formed in Chicago as early as 1874. (See CHICAGO.) In Baltimore a reform league was formed in 1885.

Law and order leagues (*q. v.*) sprang up about this time, and a National Law and Order League was established in Boston in 1883. A Massachusetts Society for Promoting Good Citizenship was organized in 1887. A Citizens' Municipal Association was organized in Philadelphia in 1886. A Citizens' Association in Boston was formed in 1887.

In New York City a Society for the Prevention of Crime had been organized Oct. 22, 1878. Its objects were

To promote in all proper and suitable ways the removal of sources and causes of crime; to assist the weak and helpless in obtaining the protection of the courts and of the laws regulating the sale of intoxicating drinks, and in protecting themselves against the temptations to crime; to aid in the enforcement of the laws of this state; to disseminate information, and to arouse a correct public opinion in support of all laws, organizing and forming meetings and associations for instruction and discussion upon such topics.

Under the presidency of Dr. Howard Crosby it did good work along its corporate lines; but in its work the collusion between criminals and the officers of the law became evident, and when, upon Dr. Crosby's death in 1892, Dr. C. H. Parkhurst (*q. v.*) became its president, he devoted himself to exposing this connection.

The resulting exposure of this and of the Lexow investigation created much attention and thought. As one result, a City Vigilance League was formed in 1892. Its objects were

To quicken among its members an appreciation of their municipal obligations; to acquaint them with existing conditions; to familiarize them with the machinery of municipal government; to make conspicuous the respect in which such government is languidly or criminally administered; to regard with jealous concern the point at which private interest enters into competition with the general good; and in every possible way to repress in the community what makes for its detriment, and to foster whatever seems fitted to promote its advantage.

Meanwhile, Mr. Edmund Kelly had organized, in 1892, the City Club of New York, and this club organized in different parts of the city some twenty Good Government Clubs (*q. v.*), which, in 1894, were federated under a Council of Good Government Clubs. A Committee of Seventy was created to oppose the Tammany machine—somewhat similar to a Committee of Fifty created by a mass-meeting in 1893. It succeeded in defeating Tammany in the city elections and putting civil-service and other reformers into some of the departments—Mr. Roosevelt as a police commissioner.

Through other cities there was a wave of organization on this line. The Civic Federation of Chicago owes its origin to the visit of Mr. W. T. Stead (*q. v.*), his revelations of the corruption there, and his effort to federate the moral forces of that city in civic and social work. (See NATIONAL CIVIC FEDERATION.)

The Municipal Reform League of Boston is older. It had its origin in an address by Mr. Samuel B. Capen in March, 1892, in which the necessity for a cooperation of the best civic and

moral forces of metropolitan Boston was stirringly set forth.

The Municipal League of Philadelphia, among the largest and best in the country, was organized in 1892.

In Philadelphia the women have been particularly active in municipal reform. They organized a Civic Club Jan. 1, 1894, and actively carry on many departments of study and work.

Such are some of the representative organizations of the movement. They are now united in a National Municipal League, organized in New York City in April, 1894, as the result of a National Conference for Good City Government, held in Philadelphia, Jan., 1894. (See NATIONAL MUNICIPAL LEAGUE; MUNICIPAL PROGRESS.)

MUNICIPAL TRADING (IN GREAT BRITAIN) (see also MUNICIPAL OWNERSHIP; GREAT BRITAIN, etc.): The tables on pages 802 and 803 are the summary given in *The Municipal Year Book* for 1906 of the official return made to Parliament in 1903 of the "reproductive enterprises" carried on by municipal boroughs brought up to March 31, 1902. For later figures see MUNICIPALISM and PUBLIC OWNERSHIP.

MUNICIPAL TRAMWAYS ASSOCIATION OF GREAT BRITAIN: The objects of this association are to acquire experimental, statistical, and scientific knowledge relating to the construction, equipment, and operation of tramways; to diffuse among its members information on all matters affecting tramways, and generally to promote the interests of municipal tramways. *Secretary and Treasurer, J. M. McElroy, 55, Piccadilly, Manchester, England.*

MUNICIPALISM (see also CITY; MUNICIPAL OWNERSHIP; MUNICIPAL REFORM; MUNICIPAL PROGRESS, etc.):

In the United States, the general tendency has been to minimize the municipality's functions. The presumption is against municipal activity and for private action. Says Judge Dillon, in his authoritative work on "Municipal Corporations":

It is a general and undisputed proposition of law, that a municipal corporation possesses and can exercise the following powers and no others: First, those granted in express words; second, those necessarily or fairly implied in or incident to the powers expressly granted; third, those essential to the declared objects and purposes of the corporation, not simply convenient, but indispensable. Any fair, reasonable doubt concerning the existence of power is resolved by the courts against the corporation, and the power is denied. Of every municipal corporation the charter, or statute by which it is created, is its organic act. Neither the corporation nor its officers can do any act, or make any contract, or incur any liability, not authorized thereby. All acts beyond the scope of the powers granted are void. . . . These principles are of transcendent importance, and lie at the foundation of the law of municipal corporations.

In Europe the opposite is the case. The result is that in America the corporate city, being thought little of, has been left, generally speaking, to be managed by a low class of politicians, and thus to become corrupt and weak; while in Europe, the function of the city being highly conceived, city offices have attracted to themselves some of the best and ablest citizens, and thus the European city has become, as compared with American cities, efficient and pure. At least such is the view of many municipalists. The only way to purify American city governments, they argue, is to exalt and expand the city's function. This, too, they say, is cheaper and better in every way for the citizens than to

allow its streets to be given over to the control of private street-railway companies, its gas, electric-lighting, and other natural monopolies to be provided by favored companies, which think first of dividend and secondly of the public convenience. Such is the theory of municipalism in brief.

Says Prof. R. T. Ely (*Christian Union*, Oct. 9, 1890):

We are reversing the order of nature in planning to reform city government first, and then to carry out the changes I have mentioned, and to make improvements in behalf of the poorer classes. Let any one name a city where this policy has been successfully pursued. I know of none.

When the Hon. Joseph Chamberlain and his friends took hold of the corrupt and inefficient city government of Birmingham, they at once "devised large measures," including the purchase of gas- and water-works by the city. A public library followed; public parks, improved dwellings for the poor, large public undertakings, broad and generous measures have been an essential part of municipal reform and improvement in cities like Berlin and Glasgow; they have not followed a purification of politics, but have helped to elevate political life.

Has the experience of this country been different? Not at all. When the city government of Baltimore was worse than it is to-day, when the "Plug Uglies" and "Blood Tube" were a terror, the government was improved by adding to its functions a paid police and a paid fire department. Extension of functions within a proper sphere improves government.

It may be urged, perhaps, that the difference of institutions between a monarchical country, like Germany or England, and a republican country, like the United States, is radical, and that things are done for the people in those countries. This is fortunately not the case. The truth is, that cities and towns have in both of these countries—Germany and England—a power which ours are far from possessing. They have more local self-government than we. They are not obliged, like Massachusetts towns, vainly to petition a legislature for authority to construct gas-works and to establish an electric-lighting plant. Such powers are either possessed, as a matter of course, or are conferred by general laws.

It is well again to make comparisons. Fifty or sixty years ago city government in England was a disgrace to the country. Has improvement come by means incompatible with democratic institutions? On the contrary, as city government has improved it has become more democratic. Germany

has also become more democratic, while the local administration has been improving.

Municipal Corruption

There may be some limitations upon the suffrage in English local politics still, and in a German city like Berlin the vote of a rich man may count for more than the vote of a poor man; but these limitations do not account for their superior local governments. These are among the differences between us and them which are growing less. And with us it is unscrupulous wealth which rules and corrupts our cities. What influence, comparatively speaking, have working men in our politics? Was Jacob Sharp a wage-earner? Were the manipulators of the West End scandal in the Massachusetts Legislature dwellers in the slums of Boston? Does any sane man in Baltimore who wishes to work a measure through our City Council rely upon the assistance of leaders of working men? I have some idea of what I would do in Baltimore. I know the men whom I would approach, but they are not wage-earners. President Seth Low has said that his study and actual experience as Mayor of Brooklyn have convinced him that universal suffrage is not the cause of bad city government. He says he did not find wealth always ready to cooperate, and he believes that our cities could not have made so rapid progress as they have without universal suffrage.

Those who object to this view generally argue that municipal enterprises are expensive and ineffective.

Municipalists, however, are not much disturbed by examples of municipal mismanagement. They believe, in the first place, that such examples can be easily matched by the mismanagement of countless private corporations. (See CORRUPTION, p. 316.) Secondly, they assert that municipal management cannot at first be expected to excel private management

Answer

in matters where the latter has had long experience and the city but little. Yet tho no one claims perfection for city management, what it has undertaken to do a growing number of careful students believe

to be better done than privately conducted interests. Work done by the city (see CONTRACT LABOR) is being found, where tried, to be surprisingly better and often cheaper than private work. Municipal street-cars, gas, electric lighting, furnish strong evidence for municipalization. (See those subjects; also MUNICIPAL TRADING.) In 1867 a private company was organized to build the Brooklyn Bridge. The charter placed the original capital stock at \$5,000,000. Of this Brooklyn gave \$3,000,000; New York, \$1,500,000; private stockholders, \$500,000. Yet tho the private stockholders gave only one tenth of the amount, they had all the power. Six ex-officio members represented the cities on the board of twenty-one directors, but they had no vote in electing other directors, and the whole power was put into the hands of the executive committee. The result was scandalous jobbery and mismanagement. Contracts for portions of the work were let to favored stockholders, etc. In order to save the bridge the cities had to buy it of the private stockholders, after which its building was a success. A committee of the cities, appointed later, with such men as Abram S. Hewitt upon it, reported that there had been practically no mismanagement except under the private management.

Municipalization, too, often lowers taxes. Berlin, Paris, etc., receive large incomes from their municipal undertakings. As the argument for municipalization, however, turns on concrete details, it must be studied under the head of the various subjects. (See also MONOPOLIES; NATURAL MONOPOLIES; SOCIALISM; INDIVIDUALISM.)

MUNICIPALITIES (GERMAN): The municipality in Germany plans everything with a view to general harmony. Factory, business, and housing districts are conformed to special needs. The height of the houses in proportion to the width of the street, and the utilization of building sites are restricted to admit light and air. Ordinances govern the height of rooms, the number of windows per room, substantial construction, etc. The pavement of the streets is suited to the character of the surrounding neighborhood.

Careful attention is given to the future erection of public buildings, playgrounds, and recreation centers. Artistic effect is always sought.

Municipal building here takes the initiative and influences private enterprise. When property is bought for building purposes, the plans

¹ Cols. 5 and 6.—Where loans have been replaced by other loans, the sum is only included once in Col. 5, in the amount of capital borrowed. In such cases, the repayments of borrowed capital moneys, out of other borrowed capital moneys, are not included, in Col. 6, in the amount of capital paid off.

² Col. 8.—Excluding sums standing to the credit of loan funds for payment of dividends. The sums entered in Col. 8 are applicable to the repayment of such portion of the amounts entered in Col. 7 as is repayable by means of sinking-funds or loan funds.

³ Col. 9.—The amounts entered in Col. 9 include sums credited to the undertakings for (e. g.) the estimated value of water used in watering streets, and the estimated value of gas supplied for lighting the streets. According to the entries the number of corporations crediting their water-works undertakings with the value of water supplied for street-watering and other public purposes was 105 out of a total of 193 carrying on such undertakings, and the number crediting their gas-works undertakings with the value of gas supplied for public lighting was 90 out of a total of 97.

⁴ Col. 12.—Including, if the undertaking is not let by the corporation, (i.) the cost of materials, wages, and salaries; (ii.) insurance and rates, and (iii.) other annual expenses, if any, other than those in Cols. 14, 15, and 16.

⁵ Col. 13.—Except in the case where the letter "L" is printed, the amount in Col. 13 is the excess of the amount in Col. 11 over the amount in Col. 12. This excess was, in the return "Municipal Corporations (Reproductive Undertakings)," No. 88 of Session 1899, called "net profit."

⁶ Col. 14.—Payments made out of income to sinking-funds and other similar funds toward the repayment of principal are included in Col. 14, but not payments out of such funds.

owing the front of the building to be erected must be submitted to the authorities for approval. The disfigurement of street fronts by bill-boards is regulated.

Sewage pipes receive street drainage as well as house sewage. Some cities separate the drainage from the sewage system. Pipes conduct the sewage outside of the city limits and utilize or dispose of it in various ways. Berlin and Breslau carry it through fields, where it is used for fertilizing and manuring. In other cities the pipes empty into rivers after their contents have been clarified. This process is costly and difficult, forcing the towns to acquire large areas to fertilize them with this waste.

The larger cities have, almost without exception, hygienic institutes where all questions relating to the public health of the city are studied. The interest of the authorities in the promotion of public health has led to a considerable decrease in mortality during the last decade. In the "seventies" the death-rate was 35 to 40 per thousand; to-day the average has decreased to 20 per thousand. In cases of contagious diseases prompt notice to the Board of Health is compulsory. All premises are disinfected by the Board of Health and the poorer classes are not charged for fumigation. In

some cities, as, for instance, Posen, disinfection is free for all classes.

The inspection of foods, such as milk, butter, and meat, is in charge of the Board of Health.

Public swimming and shower-baths are provided.

Consumptives are cared for in homes for consumptives, and persons suffering with incipient consumption are sent to forest colonies. Those unable to pay for treatment are placed in these institutions at the expense of the city or State. Asylums are provided for the feeble-minded. Any one, who on account of illness or incapacity cannot support himself, receives relief from the Poor Department, in case the sickness, old age, invalidity, and accident insurance does not provide for his maintenance or the support received is insufficient.

The departments of education of the various communities and cities provide public, elementary, and high schools. Special schools and institutes give courses in the building trade and machine-shop training. Cities engaged in special industries, such as textile, ceramic, woodwork, etc., have special schools. There are further arts and crafts schools for women. When the public-school education of the child is completed, the

† Col. 15.—Including annual payments made in respect of perpetual annuities, if any.

* Cols. 18 and 19.—See Note 5.

† The undertakings included under the head of "Other Reproductive Undertakings" are the following, viz.: Bridge (toll) at Scarborough, bridge and embankment at Plymouth, canals at Exeter and York, cold stores at Burnley, conditioning house at Bradford, York, crematorium at Kingston-upon-Hull, estates (including race-course) at Doncaster, ferries at Saltash, Birkenhead, Middlesbrough, and Sunderland, marine lakes, etc., at Southport, parade and property at Bridlington, pavilion estate at Brighton, and spa concert rooms at Harrogate.

Amounts relating to the aquarium at Brighton, telephones at Tunbridge Wells, and light railway at Southend-on-Sea are not included in the foregoing summary, because on March 31, 1902, those undertakings had not been carried on for a complete twelve months.

Particulars as to the following undertakings from which revenue is derived were also given in some of the returns furnished, viz.: Abattoirs or slaughter-houses, allotments, bonding warehouse, isolation hospital, lavatories, lunatic asylum, manure depot, sewage farms, weighing-machines and weigh-bridge, and an undertaking for the supply of sterilized milk. As these undertakings do not appear to be of the kind contemplated by the order of the House of Commons, the particulars relating thereto were not included in the return.

continuation school must be attended, etc. In the upper grades the girls are taught cooking.

For the laboring classes, people's restaurants and coffee-houses are opened, which, at the same time, serve as substitutes for the saloons.

For instruction and information in legal matters, many cities maintain bureaus and consulting stations.

Even the very smallest city runs its own slaughter-house. Every slaughter-house has a special department for the microscopic examination of pork.

Nearly all cities own their own water-works.

Gas plants are in most cases owned by the city. These add largely to the city's income.

The water-supply is not regarded by the city as a business enterprise, inasmuch as a higher rate would interfere with its free consumption. The cost to German cities for maintaining water-works is greater than in American cities, therefore the rates charged are somewhat higher, and the average consumption consequently less.

Electric-lighting plants are only partly municipalized. The tendency in this respect is, however, in favor of municipalization. Cities are urged to erect plants where as yet no electric-lighting plants exist, even to erect such plants in competition with private enterprises. Competitive plants may be successfully started where private plants are operated by withdrawing from the corporation the privilege of using the streets for conducting electricity either above or under ground.

Street-railways are only partially municipalized. In many cities these are operated by private corporations. These corporations then receive franchises from the cities to lay tracks and, in return for this privilege, they in the first place maintain part of the street in proper condition, and, secondly, pay the city annually either a certain stipulated sum, or a fixed percentage of the earnings. Many cities reserve the right to determine the fares to be charged.

Almost every city has its own municipal theater, and most of the large cities have their own concert halls, conductor, and orchestra.

Everywhere, in large cities and small towns, the authorities have expert economists working out the social, industrial, and economic problems confronting the cities in every phase of human progress. (See MUNICIPAL OWNERSHIP.)

DR. WILMS ERSTER.

MUNICIPALIZATION OF THE LIQUOR TRAFFIC (see also NORWEGIAN COMPANY SYSTEM; NATIONALIZATION OF THE LIQUOR TRAFFIC; DISPENSARY SYSTEM): In Great Britain considerable attention has been given to the proposition of municipalizing the liquor traffic. In Oct., 1902, a bill was passed in the Transvaal permitting any locality the majority of whose male white citizens voted for it to establish a municipal public house, and it is urged that this should be done in England. Arguments for it are based on the Norwegian Company system, Gothenberg system, the South Carolina Dispensary system, the State monopolies of the liquor traffic in Russia and Switzerland. It is claimed that this would reduce the traffic, since it would largely take away the money interest in it; that it would make police control easier and minimize disorderly conduct; that it would prevent adulteration or sale of illicit beverages; that it would raise a revenue for public purposes. The public

frown to-day on the municipality giving away franchises; why liquor franchises?

REFERENCE: *The Case for Municipal Drink*, E. R. Pease, 1904.

MÜNZER, THOMAS: German communist; born at Stolberg about 1490. Studying at Leipzig, became a preacher; turned against the "halfness" of Luther and Melancthon, and, led by what he believed "inner light," demanded a radical reform of Church and State. He believed in continuous divine revelation and in community of property. He promulgated these ideas in popular and effective though sometimes coarse speech. Expelled from Allstädt, where he had been preacher, he settled in Mülhausen; succeeded here in overthrowing the council and gaining a new one under his control. When the Peasants' War (*q. v.*) broke out he induced the whole population of the vicinity to rise. The peasants, however, were defeated at Frankenhausen, May 25, 1525. Münzer was captured, tortured, and beheaded at Mülhausen a few days later.

MUROMTZEV, SERGIEY ANDREYEVICH: Russian member of the Duma; born 1850. Representative Constitutional Democrat from the city of Moscow. Graduate of Moscow College and University; studied at Göttingen University, where he took the degree of Doctor of Roman Law (1876). He became editor of *Yuridicheski Vvestnik* (Judicial Messenger) in 1879, and was elected vice-president of Moscow University, 1880. He was appointed ordinary professor of Roman law in the Moscow University in 1887. Muromtzev is chairman of the Moscow Municipal Council, member of the Moscow and Tula Zemstvo societies, and president of the First Duma, an office to which he was elected unanimously.

MURPHY, FRANCIS: Temperance advocate; born 1836 in Wexford, Ireland, he came to the United States as a child, and later served in the Civil War. In 1870 he began to organize temperance clubs in Portland, Me., and later through the state. He transferred his headquarters to Pittsburg, Pa., in 1876, where 45,000 people signed the pledge after his first address. He extended his activities through different parts of the U. S. and England; and 10,000,000 people are said to have signed the pledge as a result of his persuasive and eloquent advocacy of temperance. During the Spanish-American War he served as chaplain.

MUSEUMS OF SECURITY: Permanent exhibitions of apparatus and devices for the prevention of accidents in factories and workshops, so that all employers of labor may see in actual operation the safety devices that will guard the life and limbs of workers. The first was opened in Amsterdam in 1893. It is supported by voluntary subscriptions from individuals, by State aid, and a gift of building from the city. The labor inspectors of Holland find that the museum is of the greatest service to them, because it meets every objection on the part of a superintendent that the safety device in question will interfere with the proper operation of his machinery. If a manufacturer is not satisfied with a photograph of the appliance, he can send his superintendent, or come himself to the museum, where he can study every detail of the operation. There are safeguarded models of gearing, belts, wheels, eleva-

tors, windlasses, cranks, staircases, fire escapes, shafts, and scaffolding, and workshops of half the natural size, installed with the best systems of ventilation.

There are similar museums in Munich, Charlottenburg, Milan, and Moscow, with movements under way for the establishment of museums in other cities. In 1907 the American Institute of Social Service organized an exhibition of safety devices in New York City, which has led to a permanent Exhibit of Safety Devices and Industrial Hygiene at 231-241 West Thirty-ninth Street, New York City. W. H. TOLMAN.

MUTUAL BANKING: By this phrase is usually meant a monetary system first formulated by Colonel William B. Greene, of Boston, about 1850. It has been somewhat modified, but is to-day advocated by most extreme individualists. A mutual bank propaganda was started in Chicago. Its secretary, Mr. Westrup, describes the plan in his "The Financial Problem," as follows:

The inhabitants or any portion of the inhabitants of any town or city may organize themselves into a mutual banking company.

Any person may become a member of the mutual banking company, of any particular town or city, by pledging unencumbered improved real estate, never vacant lands, situated in that town or city, or in its immediate neighborhood, or other first-class collateral to the bank.

The mutual bank should print (or have printed) paper money, with which to discount the notes of its members, and should always furnish new bills for torn or soiled ones when requested, free of charge.

Every member, at the time his note is discounted by the bank, should bind himself, and be bound in due legal form, to receive in payment of debts at par, and from all persons, the bills issued and to be issued by the bank.

Notes falling due may be renewed by the bank, subject to the modification which a new valuation may require, so that the note does not exceed two thirds.

Any person may borrow the paper money of a mutual bank on his own note not extending beyond twelve months (without indorsement), to an amount not to exceed two thirds of the value of the collateral pledged by him.

The charge which the mutual bank should make for the loans should be determined by and, if possible, not exceed the expenses of the institution, *pro rata*.

No money should be loaned by the bank except on the above conditions.

Any member may have his property released from pledge and be himself released from all obligations to the mutual bank, and to the holders of its bills as such, by paying his note or notes to the said bank.

The mutual bank shall receive none other than its own money, or that of similar institutions, except such coin money as the board of directors may designate, and this should be discounted one half of 1 per cent.

NASSE, ERWIN: Born at Bonn, 1829; studied there and at Göttingen, and took his degree of Doctor in 1851. After study in Berlin he established himself as *privat-docent* in Bonn, in 1854, whence he was called, in 1856, as professor to Basel, and the same year to Rostock. In 1860 he came to his native city as professor. He took an active part in political affairs, and was from 1869 to 1879 member of the Prussian House of Deputies, where he rendered important services on the budget commission. He was one of the founders of the *Verein für Socialpolitik* (see SOCIALISTS OF THE CHAIR) and the president of it from 1874 to his death, 1890. Professor Nasse was a frequent contributor to scientific journals.

NATION AND NATIONALITY: Blüntschi, in his "The Theory of the State" (tr. from the German, p. 90), defines a nation as "a society of all

All mutual banks may enter into such arrangements with each other as shall enable them to receive each other's bills.

The mutual bank should publish in one or more daily papers each day a statement of its loans the day previous, describing the property pledged, giving the owner's name and its location, with the appraiser's value and the amount loaned on it, and also a statement of the notes paid and mortgages canceled during the same period, which statement should be signed by the manager, cashier, and secretary.

The mutual bank should exchange, at any time, any of its own bills that are torn or worn for new ones without charge.

To this plan Socialists say that the main and in one sense the only sufficient objection is that unless all entered into this mutual system it would not serve the complete needs of society as a medium of exchange, so that government or some other organization would still have to provide money; and that when all did enter into it it would be a monetary cooperative commonwealth, such as democratic socialism is more speedily leading us to realize. Till we have this, government needs to control the issue of money in order to prevent the ignorant and innocent from being deceived by the speculator and the sharper. (See ANARCHISM; SOCIALISM.)

MUTUALISM is a term preferred by some, like the late Bishop Brooks, in place of socialism.

The term mutualism is used to denote a condition of society in which the governing principle is mutual help. When two persons work together in partnership or live together in harmonious family life we have mutualism in miniature. When the principle of partnership or union of ownership, effort, and control for the common benefit shall be extended to the whole social life of city, state, and nation, we shall have a mutualism complete upon the plane of justice. And when love and brotherhood become the animating principle of the partnership, and each member of society not merely cooperates with the rest, but devotes himself to the welfare of the rest, we shall have a mutualism of the loftiest type. The earlier outward steps toward mutualism are the public ownership of monopolies and the growth of cooperative enterprises, which processes, meeting each other half-way, will bring about a common ownership of the means of production and distribution, industrial self-government or democracy, economic equality, and a cooperative character. Finally, men will come to know that the joys of intellectual and spiritual activity infinitely exceed the pleasures of the senses. Then they will wish for wealth merely so far as it may be a means of fitting them for the noblest intellectual and spiritual life. They will also learn that the richest and most enduring happiness can only be won through the happiness of others—learn it not in words alone, but in thoughts and emotions sufficiently strong to sway their conduct. Then the golden rule and brother love and devotion will become the real governing law of daily life, and mutualism will have reached its goal.

FRANK PARSONS.

N

the members of a state as united and organized in the State." He thus makes it a concept dependent upon the State. The State he defines (idem, p. 23) as "the politically organized national person of a definite country." The two definitions are thus made mutually dependent and the same dependence will be found to run through almost all definitions, because the ideas are themselves mutually dependent. It is scarcely possible to have a nation that is not a state, nor a state that is not a nation. Nevertheless the two words, tho often used, even by careful writers, somewhat synonymously, and tho continually popularly confused, are not absolutely synonymous. A state is a nation politically organized. A nation is the organic collectivity of all the people in a state, implying indeed a political organism, but not limiting the collectivity to its political aspect. The concept people,

on the other hand, is still wider than the concept a nation. The word people implies the collectivity of persons living in a state, but does not conceive it as an organic unity, political or of any sort. It conceives of them as a whole and perhaps as a united whole, but not as an organized whole. Such are the differences, or shades of difference, that are usually made by English writers between these three words. Nevertheless the distinctions are not always observed, even by the best writers. In other languages, too, the word nation is used quite differently. The Germans call a people a nation, and what we mean by nation they call a *volk*. The old Latin *natio* meant what we mean by people. Indeed the conception nation as of the organic unity of a people may be considered a wholly modern conception. Despotism knows nothing of a nation. It only recognizes peoples and states.

Analysing more carefully the conception nation, we find first that a nation implies a certain territory in which it must live. Says Woolsey ("Introduction to Inter. Law," §52):

Content

"A nation is an organized community within a certain territory; or in other words there must be a place where its sole sovereignty is exercised." A nation may be conceived as changing its country but it must have a country, at least in prospect. It is scarcely possible to-day to speak of the Jewish nation. Secondly, a nation must have a natural unity; ordinarily, tho not always, it must be composed of persons of the same ethnic family and speaking the same language, or at least cognate languages. Even when this does not exist, as it does not wholly in the United States, nevertheless there must be a national unity besides that of place. M. W. Ward says ("Eng. Dram. Lit.," Int. p. xvi.): "A nation may be defined as a body of population which its proper history has made one in itself, and as such distinct from all others." A nation thus is a growth. We see this in the derivation of the word from *nasci*, to be born. Unity of race, of language, of religion, of civilization, of government, of experience, of place, all contribute in varying degree to gradually separate one nation from another. Thirdly, a nation must have some conscious and exprest unity. It must have somewhat of a common will. Blüntschi calls it a collective personality.

These conceptions and definitions may be illustrated by pointing out that Italy and Germany were nations long before they were states; that Rome was never a nation tho a state; that ancient Greece was one people, but never a nation or a state; that the U. S., altho composed of many states and with many varieties of race, language, religion, and custom, is nevertheless one state, one nation, and one people. To take other examples we speak of the Secretary of State, the national flag, the representatives of the people.

Thus conceiving of the nation, we see that it is a modern growth, and that it must be, because it takes time and implies high civilization and wide-spread liberty to develop a nation. Antiquity knew no nations. Egypt, China, Assyria, did not develop nations. They consisted of a people, or various peoples, ruled over by a monarch.

Historical Sketch

Greece had cities or states, but developed no nation. There was liberty, but no wide-spread union. The Roman Empire was not a nation; it had unity, but its various constituent parts did not have liberty or a common will. The Middle Ages saw no nations tho nationality was growing. England may be said to have developed as a nation almost before the close of the Middle Ages, and France and Italy and Germany were not far behind, yet Italy and Germany were hindered in the development of national unity by division into rival states, and France developed so tyrannical a state as, until the Revolution, to have little of the liberty necessary to a true nationality. With freedom and self-government has come that love of country, that common life, which produces the modern nation.

In this brief historical survey attention must be called to the various conceptions of nationality that have prevailed. The Roman people, not a nation in the modern sense of the word, had the word *natio*, but they understood by it what we mean by people. It had an ethnographic base. A people were those descended from a common stock. The law which determined nationality with the Romans was the *jus sanguinis*, the law of blood relationship.

The Germanic tribes, gradually setting up their feudal governments over Western Europe, conceived of the nation as a territorial unit, its people being bound by feudal oaths to allegiance. Commonly the place of birth settled the allegiance, but the allegiance was even more than the birth. Nationality was thus a *jus solis*, or law of the land. This is the law that lies at the basis of the English common law. It is the personal relation of the individual to the sovereign which

constitutes nationality. An Englishman is not subject to the king because he is an Englishman; he is an Englishman because he is subject to the king. The king being in England hereditary, or perpetual, the oath of allegiance was considered perpetual; nevertheless, it came to be recognized in common law that the subject could freely withdraw his person and property from the jurisdiction of the crown, unless expressly prohibited by king or parliament. Yet no law permitting expatriation was passed until 1870.

When the U. S. became independent the relation of allegiance was considered as transferred both to the states and to the national federation. Which allegiance is supreme has long been a mooted point (see CENTRALIZATION), but it may be considered as settled, at least as far as law goes, that the supreme allegiance is to the federal government.

From this historical résumé and from the conception of nationality itself, it is not hard to see that the nation must play a large part in social reform. Nevertheless, political scientists have been divided between those who would exalt the unity of race and those who would exalt the unity of the nation. Modern socialism on the other hand has been somewhat inclined to ignore both social and national unities, and to develop an internationalism. This is generally the case among European Socialists, but English and American Socialists have generally and more wisely held that the nation is a natural unit; that if socialism is to be evolutionary it must develop around the natural unities of the town, city, state, and nation, and that only when these are somewhat developed can we gradually grow toward a healthy internationalism.

For further consideration of the subject, see POLITICAL SCIENCE, STATE SOVEREIGNTY, etc. For references, see STATE.

NATIONAL AMERICAN WOMAN SUFFRAGE ASSOCIATION: President, Rev. Anna Howard Shaw; corresponding secretary, Kate M. Gordon, 1800 Prytania Street, New Orleans, La. (See WOMAN'S SUFFRAGE ASSOCIATION.)

NATIONAL CASH REGISTER COMPANY, WELFARE WORK AT: The National Cash Register Company, at Dayton, Ohio, is undoubtedly the leading firm in America in welfare work or industrial betterment (*q. v.*). It began this work as early as 1893, the first steps being the improvement of the factory premises. To-day the thirteen massive buildings, covered here and there with vines, tho four fifths of the wall space are plate-glass, and surrounded by broad lawns, with trees, shrubbery, and asphalt walks, are among the most attractive factory buildings in the world. Inside they are kept scrupulously clean and attractive, and are equipped with the best appliances for heat, cold, and fresh air; 116 uniformed janitors attend to this; 23 girls and 4 men attend to the laundry. For the 8,000 employees (800 women), attractive lunches are served in a special building with a hall seating 3,000 at tables and 6,500 as an auditorium. The girls pay five cents a day for a good lunch; the men seventy-five cents a week. Entertainments (music, moving pictures, vaudeville) are given in winter at the noon hour. Rest rooms with nurses and two physicians are provided. There are nearly 200 shower-baths and 200 lavatories for free use. Twice a day the women stop ten minutes for calisthenic exercise. A "Women's Century Club" has a club house and cooperative homes for young women. The Men's Welfare League has two settlements for men. An athletic field provides football, baseball, and other sports. Vacation schools and camps are arranged. Employees are encouraged to make

inventions and suggestions. Prizes are given for beautifying houses and gardens. Boys are taught gardening. Manual training of various kinds is taught in the schools. A newspaper is published. Lectures are given. Much else is done. The firm says that it all pays.

NATIONAL CHILD LABOR COMMITTEE: A committee organized April 15, 1904, whose objects are: (1) To promote the welfare of society with respect to the employment of children in gainful occupations. (2) To investigate and report the facts concerning child labor. (3) To raise the standard of public opinion and parental responsibility with respect to the employment of children. (4) To assist in protecting children by suitable legislation against premature or otherwise injurious employment, and thus to aid in securing for them an opportunity for elementary education and physical development sufficient for the demands of citizenship and the requirements of industrial efficiency. (5) To aid in promoting the enforcement of laws relating to child labor. (6) To coordinate, unify, and supplement the work of state or local child labor committees, and encourage the formation of such committees where they do not exist.

For statement of general plan and scope of work, see **CHILD LABOR** (pp. 170-175). The chairman is Felix Adler; vice-chairmen, Homer Folks, Samuel McCune Lindsay; acting secretary, Owen R. Lovejoy; assistant secretary, A. J. McKelway. *Offices:* 105 East Twenty-Second Street, New York City, and Century Building, Atlanta, Ga.

NATIONAL CHILDREN'S HOME SOCIETY: A federation of twenty-six state societies, organized 1883. Altho several of these organizations are so new that their work is barely begun, 26,000 orphans and neglected children have been thus far cared for, more than half of whom are still under friendly supervision. The number handled last year was 4,013, of whom 2,356 were newly received. *President,* Prof. C. R. Henderson; *secretary,* Hastings H. Hart, LL.D., 601 Unity Building, Chicago, Ill.

NATIONAL CHRISTIAN LEAGUE FOR THE PROMOTION OF PURITY, THE: An organization, founded 1891, largely through the influence of Mrs. Elizabeth B. Grannis, which strives "to elevate public opinion respecting the nature and claims of morality, with its equal obligation upon men and women, and to secure a proper practical recognition of its precepts on the part of the individual, the family, and the nation." The league holds meetings annually, and has increased in the number and influence of its patrons and members. It has for years tried to make infidelity a legal crime, and succeeded in having the New York Legislature pass the so-called Phillips Bill—taking effect Sept. 1, 1907—which makes adultery a crime punishable with imprisonment up to six months, and applies equally to both sexes. The law permitting the prosecution of the person proven guilty of adultery is now a law in every state of the United States. *President,* Mrs. Elizabeth B. Grannis, 5 East Twelfth Street, New York City.

NATIONAL CIVIC FEDERATION: This organization grew out of conferences on arbitration and conciliation, held in Chicago, Dec., 1900,

under the auspices of the Chicago Civic Federation, of which Mr. Ralph M. Easley was the secretary and chief organizer, as he has been of the National Federation. A committee of twelve members was appointed, representing labor, capital, and the general public. This committee met and organized in Jan., 1901, and was able to avert a threatened anthracite coal strike by securing a conference of the operators and the mine-workers.

At a third conference, under the name of the National Civic Federation, held in New York in Dec., 1901, the executive committee was reorganized to include twelve representatives each from labor, capital, and the general public, afterward increased to fifteen members each. Headquarters were taken in New York City.

The objects of the federation are stated as follows:

The National Civic Federation aims to bring into cooperation the sane and patriotic leaders of the forces of employers and employed, and of the interested but too often forgotten and forgetting third party, the general public. Its purpose is constructive, not destructive. It would develop, through the agencies here described, the best elements in the organizations of capital and of labor, and it would keep awake a wholesome public concern in the profit of one, the welfare of the other, and the prosperity of all, through the diffusion of an intelligent understanding of economic laws. It would show that organized labor cannot be destroyed without the debasement of the masses. It would show that organized labor can be led to correct its errors. It would show that capital can be taught the practicability of securing industrial peace in accordance with business methods. It would show that the twin foes of industrial peace are the antiunion employers and the Socialists, and that the former are unconsciously promoting that class hatred which the latter boldly advocates. It would present a hopeful picture of future harmony between capital and labor, based upon the establishment of their rightful relations, instead of the pessimistic prophecy of the degradation of labor because of its exceptional and inexcusable errors or crimes, or of a social revolution provoked by capital when organized for oppression.

The federation works largely through various departments.

(1) The Public Ownership Commission composed of 100 prominent men representing every shade of opinion on this subject. (See below.)

(2) The Immigration Department composed of men selected to represent all localities in the union affected by the admission of aliens.

(3) The Department of Conciliation and Arbitration has a membership extending to every industrial center, but works largely through an executive committee composed of the most representative (in equal numbers) of capitalists, wage-earners, and the general public. It has been very influential and successful in settling a large number of important industrial conflicts in all portions of the country, and still more in preventing the development of conflicts.

(4) The Department of Trade Agreements works to establish such agreements (see **TRADE AGREEMENTS**), and in every way to advocate their adoption.

(5) The Welfare Department educates the public as to the meaning and value of welfare work, which is understood to involve especial consideration for physical comfort wherever labor is performed; opportunities for recreation; educational opportunities; and the providing of suitable sanitary homes. Plans for saving and lending money, insurance, and pensions are also included in welfare work.

The department interests employers in giving especial attention to the physical or mental welfare of their employees through conferences, and the publication of reports and articles.

Upon request, a consulting agent is furnished to study the particular needs of employees in a given plant, to advise the best way of introducing such methods of welfare work as may be deemed essential, and to direct their installation. When desired, a permanent agent or welfare manager to administer the work is recommended.

A central bureau, under the charge of Miss Gertrude Beeks, is maintained to furnish information relative to the success or failure of experiments in this work, the causes of either, and with reference to the latest efforts of employers in this direction.

(6) The Department of Industrial Economics, more recently organized, is composed of editors of the daily press and of politico-social magazines, trade papers, and labor

Journals, and of economic and legal authors, lecturers, and the heads of the departments of political economy in universities. These are brought together at informal dinners, to consider some one of the industrial topics that have been enumerated.

A large part of the work of the federation has been done by important conferences on important subjects of the day, notably on arbitration and conciliation, on immigration, on primary and election laws. In 1906 the federation created an important public ownership commission, composed of twenty-one expert students of the question, equally divided between believers, non-believers, and those not committed on the question. This commission studied typical instances of private and publicly owned public services, both in the United States and in Great Britain, and made a notable report in 1907. (See **PUBLIC OWNERSHIP**.)

The executive committee of the federation representing its three component elements are:

On the Part of the Public

Grover Cleveland, ex-President of the United States Princeton, N. J.; Andrew Carnegie, capitalist, New York City; Cornelius N. Bliss, ex-Secretary of the Interior, New York City; Oscar S. Straus, member of the Court of Arbitration at The Hague, New York City; Charles W. Eliot, president Harvard University, Cambridge, Mass.; Nicholas Murray Butler, president Columbia University, New York City; Seth Low, publicist, New York City; Archbishop John Ireland, of the Roman Catholic Church, St. Paul, Minn.; Bishop Henry C. Potter, of the Protestant Episcopal Church, New York City; Charles J. Bonaparte, Secretary of the Navy, Washington, D. C.; David R. Francis, ex-Secretary of the Interior, St. Louis, Mo.; Isaac N. Seligman, of J. & W. Seligman & Co., New York City; James Speyer, of Speyer & Co., New York City; V. Everit Macy, capitalist, New York City; Ralph M. Easley, chairman Executive Council, New York City.

On the Part of Employers

Henry Phipps, director U. S. Steel Corporation, New York City; August Belmont, president Interborough Rapid Transit Company, New York City; Clarence H. MacKay, president Postal Telegraph Cable Company, New York City; Lucius Tuttle, president Boston & Maine Railroad, Boston; W. A. Clark, president United Verde Copper Company, Butte, Mont.; Frederick D. Underwood, president Erie Railroad Company, New York City; Frederick P. Fish, president American Telephone and Telegraph Company, Boston; Francis L. Robbins, president Pittsburg Coal Company, Pittsburg; H. H. Vreeland, president New York City Railway Company, New York City; Samuel Mather, of Pickands, Mather & Co., Cleveland; Charles A. Moore, of Manning, Maxwell & Moore, New York City; Franklin MacVeagh, of Franklin MacVeagh & Co., Chicago; Charles H. Taylor, Jr., ex-president American Newspaper Publishers' Association, Boston; Dan R. Hanna, of M. A. Hanna & Co., Cleveland; Marcus M. Marks, president National Association of Clothing Manufacturers, New York City; Otto M. Eidlitz, chairman Board of Governors, Building Trades Employers' Association, New York City.

On the Part of Wage-earners

Samuel Gompers, president American Federation of Labor, Washington; John Mitchell, president United Mine Workers of America, Indianapolis; E. E. Clark, grand chief conductor, Order of Railway Conductors, Cedar Rapids, Iowa; James Duncan, general secretary Granite Cutters' International Association of America, Quincy, Mass.; Daniel J. Keefe, president International Longshoremen, Marine and Transport Workers' Association, Detroit, Mich.; Warren S. Stone, grand chief International Brotherhood of Locomotive Engineers, Cleveland; P. H. Morrissey, grand master Brotherhood Railroad Trainmen, Cleveland; William D. Mahon, president Amalgamated Association of Street-Railway Employees of America, Detroit; William J. Bowen, president Bricklayers and Masons' International Union, Indianapolis; J. J. Hannahan, grand master Brotherhood Locomotive Firemen, Peoria, Ill.; James O'Connell, president International Association of Machinists, Washington, D. C.; John F. Tobin, general president Boot and Shoe Workers' Union, Boston; Joseph P. Valentine, president Iron Molders' Union of North America, Cincinnati; James M. Lynch, president International Typographical Union, Indianapolis; Denis A. Hayes, president Glass Bottle Blowers' Association of the U. S. and Canada, Philadelphia; William Huber, president United Brotherhood of Carpenters and Joiners of America, Indianapolis, Ind.

The president of the federation is August Belmont; vice-presidents, Samuel Gompers, Oscar S. Straus; chairman executive council, Ralph M. Easley. *Secretary*, Samuel B. Donnelly, office 281 Fourth Avenue, New York City.

NATIONAL CIVIL SERVICE REFORM LEAGUE: Organized in 1881. Object, "To advance the cause of civil-service reform in the United States." (See **CIVIL-SERVICE REFORM**.) *President*, Dr. D. C. Gilman, Baltimore, Md. *Secretary*, Elliot H. Goodwin, 79 Wall Street, New York.

NATIONAL CURFEW ASSOCIATION: Founded by Alex. Hogeland in 1889. It agitates for the ringing of the curfew, after which children found unaccompanied on the streets are liable to arrest. It has been adopted in over 4,000 cities and towns of the United States and Canada, and a decrease of crime is claimed in these places from 50 to 80 per cent. *Corresponding Secretary*, Rev. J. H. Bradford, 1753 Park Road, Washington, D. C.

NATIONAL DIRECT LEGISLATION LEAGUE (founded 1896): See **DIRECT LEGISLATION**, p. 385. *President*, Eltwed Pomeroy. *Secretary*, G. H. Strobell, Kinney and Orchard Streets, Newark, N. J.

NATIONAL EDUCATION ASSOCIATION (Great Britain): Established in 1889, to promote a system of national education which shall be efficient, progressive, unsectarian, and under popular control. Its constitution and policy are controlled by a council of 300 members. *President*, Rt. Hon. A. H. D. Acland. *Secretaries*, Mr. A. J. Mundella and Mr. T. E. Minshall. *Offices*, Caxton House, Westminster, S. W., Eng.

NATIONAL EDUCATION ASSOCIATION: Organized under the name of National Teachers' Association in 1857. Object: To further and shape national educational aims and progress. The annual meetings previous to 1884 were small in numbers, averaging about 200 members; since 1884 the annual conventions have averaged more than 6,000 members; since 1895 the average annual membership has been nearly 10,000. The establishment by Congress of the Bureau of Education of the United States and of the office of U. S. Commissioner of Education was secured through the early efforts of the association. The recent special committee reports indicate the lines of investigation which, in addition to the work of its annual conventions, have made the association the most important educational organization in the world. The forty-four annual volumes of Proceedings, including the Proceedings of the International Congresses of Education, constitute the chief publications of the association, and have come to be regarded as the most valuable library of educational literature extant. Congress has enacted a new charter of incorporation under the name of "National Education Association of the U. S.," which was adopted July 10, 1907, at the annual meeting, and became operative at once. According to this charter, the association has seventeen different departments: National Council of Education and departments of Kindergarten Education, Elementary Education, Secondary Education, Higher Education, Normal Schools, Superintend-

ence, Manual Training, Art Education, Music Education, Business Education, Child Study, Physical Education, Science Instruction, School Administration, Special Education, Indian Education, Library Department. *Secretary*, Irwin Shepard, Winona, Minn.

NATIONAL HOUSEHOLD ECONOMIC ASSOCIATION, THE: This association was incorporated March 16, 1893, under the name of the National Columbian Household Economic Association, but at its meeting in April, 1894, the word Columbian was dropped from its name. The object of the association, as declared in its constitution, is:

1. To awaken the public mind to the importance of establishing bureaus of information where there can be an exchange of wants and needs between employer and employed, in every department of home and social life. 2. To promote among members of the association a more scientific knowledge of the economic value of various foods and fuels; a more intelligent understanding of correct plumbing and drainage in our homes, as well as need for pure water and good light in a sanitariously built house. 3. To secure skilled labor in every department in our homes, and to organize schools of household science and service.

The management is vested in a board of sixteen directors, with headquarters in Chicago, but composed of members from all states. The association holds annual meetings, and has the following standing committees:

1. Committee on Sanitary Condition of the Home Correct Plumbing and Ventilation, Light, Heat, etc. The duties of this committee shall be to establish home science clubs and to make a study of sanitary science.

2. Committee on Cooking Schools, Industrial Schools, Housekeepers' Emergency Bureau, Cooperative Laundries, Cooperative Bakeries, Training School for Servants, Kitchen Gardens and Public Kindergartens, Diet Kitchens, Mothers' and Nurse Girls' classes, and Training School for Nurses. The duties of this committee shall be to keep itself informed of the work of each school and institution, and to direct all who wish to know where and at what hour one may visit these schools.

3. Committee on Food Supply. The duties of this committee shall be to prepare a descriptive list of wholesale and retail foods, such as meat, vegetables, butter, eggs, etc.; to compare New York and Chicago with other markets, and furnish statements of what articles of food are most desirable to buy, either in large or small quantities, with household recipes for cooking and all other matters relating to household economics.

4. Committee on Housekeepers' Clubs. The duties of this committee shall be to formulate plans to simplify housework in village communities, to suggest plans for cooperation in laundries, bakeries, and kitchens, to discuss plans for profitable market gardening, poultry and egg-raising on a small scale, and to furnish information on all topics connected with housework.

5. Committee on Sewing. The duties of this committee shall be to keep itself informed of the work done in various schools where sewing is taught, and give outlines of the methods used.

6. Press Committee. It shall be the duty of this committee to secure the publication of notes concerning the National Household Economic Association in some journal or periodical in the north, south, east, west, and middle sections of the country, in order to keep alive public interest in the science of household economics, each member of the committee taking charge of the matter in her own section.

All women may become members of this association by the payment of an annual fee of \$1.

The association works mainly not by establishing new clubs, but by inducing existing woman's clubs to establish departments of household economics, for the study of how better to manage the home, educate better servants, have more healthy food, etc. The honorary president of the association is Mrs. Potter Palmer; the corresponding secretary, Mrs. Alice J. Whitney, 453 Belden Avenue, Chicago, Ill. Mrs. Helen Campbell (*q. v.*) has been appointed national lecturer for the association, and the syllabus of her lectures has since been adopted as a part of the

program of the association, and gives something of the scope of this important subject, but cannot be reproduced here.

NATIONAL HOUSING REFORM COUNCIL FOR ENGLAND AND WALES: Objects: The council has a well-defined and practical program of municipal housing work, including the efficient usage of existing powers under the Housing and Public Health Acts. It strives also for the extension of these powers and the granting of new powers to local authorities to enable them to acquire municipal estates, to stop the process of new slum creation by proper methods of planning, etc., etc. An Advisory Committee, composed of members of Parliament and leading housing reformers, has been established by the efforts of the council. *Secretary*, Henry R. Aldridge, 432, West Strand, London, W. C., and *Central Office*, 18, Dulverton Road, Leicester, England.

NATIONAL IRRIGATION ASSOCIATION: Organized 1899 by G. H. Maxwell (*q. v.*), who conducted the campaign for irrigation resulting in the passage of the National Irrigation Act, 1901. *Secretary*, Guy E. Mitchell, 1419 F Street, Washington, D. C.

NATIONAL LEAGUE FOR THE PROTECTION OF THE FAMILY: Formed in 1881. Object: Promotion of better public sentiment and legislation regarding the family, especially on marriage and divorce. The league publishes an important annual report. (See DIKE, S. W.) *Secretary*, Rev. Samuel W. Dike, LL.D., Auburndale, Mass.

NATIONAL MUNICIPAL LEAGUE: Formed in 1894. Through its annual conferences it enables the workers in behalf of municipal betterment to come into personal touch and exchange views. Through active committees the league has brought together groups of acknowledged experts and public men who have formulated reports of great value to students and administrators. Through its executive officers the league is in constant touch with local and national movements concerned with municipal questions. Annual subscription, \$5. Its annual congresses are among the most important congresses of experts as to civic reform in the United States, and the reports of these congresses the most valuable statements upon these subjects. One of the most valuable features of these congresses and reports is the annual review (since 1894) of the municipal situation in the leading cities of the country, by the secretary, Mr. Woodruff. (See MUNICIPAL PROGRESS IN THE U. S.) *Secretary*, Clinton Rogers Woodruff, 703 N. American Building, Philadelphia.

NATIONAL PRISON ASSOCIATION: Organized in 1870. In 1907 its name was changed to the American Prison Association. Aims: The reform of criminal law; preventive and reformatory law; improvement of prison discipline; the police force of cities. An association of growing importance. Its congress at Chicago, 1907, had an attendance of 540. It has the following committees and chairmen (chosen 1907): Criminal Law Reform, Roger Phelps Clark, Binghamton, N. Y.; Preventive and Reformatory Work, T. B. Patton, Huntingdon, Pa.; Prevention and Probation, Homer Folks, New York, N. Y.; Prison Discipline, M. M. Mallary, Pontiac, Ill.; Dis-

charged Prisoners, Joseph S. Pugmire, Toronto; Statistics of Crime, S. J. Barrows, New York, N. Y. *General Secretary*, Amos W. Butler, State House, Indianapolis, Ind.

NATIONAL PURITY FEDERATION, THE: Organized at the National Purity Conference at La Crosse, Wis., Oct., 1905. "Its object is to unite in national cooperation all those forces in America that are striving to promote purity in the individual and in social relations through preventive, educational, reformatory, rescue, law enforcement, legislative, and sanitary lines of effort. It is in every sense non-sectarian, and is open to all who are sincerely and seriously striving to promote its object." The second conference was held in Chicago, Oct., 1906; the third in Battle Creek, Mich., Nov. 1907. *President*, B. S. Steadwell, La Crosse, Wis. *Corresponding Secretary*, Miss Hattie Dickson, 1110 West Main Street, Marshalltown, Iowa. *Organ*: *The Light*, published (since 1897) by the president. (See SOCIAL PURITY.)

The Canadian Purity Education Society is a branch of the Federation. *Secretary*, Rowena D. S. Hume, 226 Carlton Street, Toronto.

NATIONAL SECULAR SOCIETY: This society works against all creed or religious tests, practises, grants, recognition, or any connection whatsoever between the State and religion. *Secretary*, Miss E. M. Vance, 2, Newcastle Street, Farringdon Street, London, E. C., England.

NATIONAL SUNDAY LEAGUE (Great Britain): Established 1855. Objects: The opening of museums, art-galleries, and libraries on Sunday afternoons, and generally aims at promoting intellectual and elevating recreation on that day. *Secretary*, Henry Mills. *Offices*, 34, Red Lion Square, High Holborn, London, W. C., England.

NATIONAL UNION OF WOMEN'S SUFFRAGE SOCIETIES: Objects: The society is organized to secure the parliamentary enfranchisement of women, and advances the claim that as the work contributed by women to the State increases year by year, the artificial disqualification which now renders that work more difficult should be swept away. It seeks to obtain the franchise on the same lines as it is, or may be, granted to men, and is persistent in memorializing members of Parliament and forming committees and societies in its area of work. A conference of M. P.'s favorable to women's suffrage is usually held at the commencement of the annual session, to promote the introduction of a bill or resolution.

President, Mrs. Henry Fawcett, LL.D. *Honorary Secretaries*, Miss F. Hardcastle, M.A., and Miss F. Sterling. *Central Office*, 25, Victoria Street, S. W., London, England.

NATIONAL UNION OF WOMEN WORKERS OF GREAT BRITAIN AND IRELAND, THE (federated with the International Council of Women): Organized 1895. The union is organized in the interests of no one policy, and has no power over the organizations which constitute it; federated societies incur no responsibility on account of any action taken either by the council of the union or by any other federated society.

Objects.—1. To promote sympathy of thought and purpose among the women of Great Britain and Ireland.

2. To promote the social, civil, moral, and religious welfare of women.

3. To focus and redistribute information likely to be of service to women workers.

4. To federate women's organizations and to encourage and assist the formation of local councils and unions of women. *Secretary*, Miss Norah E. Green, Parliament Mansions, Westminster.

NATIONAL VIGILANCE ASSOCIATION (Great Britain): Objects: The suppression of the "white slave traffic" and the repression of criminal vice and public immorality. National committees have been formed in every country in Europe, in the Argentine, Egypt, and South Africa, to co-operate in dealing with the evil in question. *Secretary*, W. A. Coote. *Office*, St. Mary's Chambers, 161, Strand, W. C., London, England.

NATIONAL WOMEN'S LABOR LEAGUE (Great Britain): Formed 1906. Objects: To form an organization of women to work for independent labor representation in connection with the Labor Party, and to obtain direct labor representation of women in Parliament and on all local bodies.

The members of the society work with the Labor Party locally and nationally, and help Labor candidates in local and parliamentary elections. They educate themselves on political and social questions by means of meetings, discussions, distribution of leaflets, etc. They take an active interest in the work of the Poor Law Guardians, educational bodies, distress committees, registration of voters, town, district, and county councilors, and members of Parliament; work to secure the full rights of citizenship for all women and men.

President, Mrs. J. R. Macdonald. *Honorary Secretary*, Mrs. F. Macpherson, B.A., 34, St. Thomas's Mansions, Westminster Bridge, London.

NATIONALISM: The American name for the economic ideal, pictured in Edward Bellamy's novel, "Looking Backward," and also to the reform movement that arose in connection with this book. Says Mr. Bellamy:

This plan is called nationalism because it proceeds by the nationalization of industries, including, as minor applications of the same principle, the municipalization and State control of localized businesses.

Socialism implies the socializing of industry. This may or may not be based upon the national organism, and may or may not imply economic equality. As compared with socialism, nationalism is a definition not in the sense of opposition or exclusion, but of a precision rendered necessary by a cloud of vague and disputed implications historically attached to the former word.

Nationalists put deep emphasis upon the necessity for economic equality. Some Socialists do likewise, but some do not. In this respect, and in its starting from a distinctly national basis, lies its difference from socialism.

The Nationalist movement in the United States dates from Dec. 1, 1888, when the first Nationalist club was organized in Boston. The idea of the movement, as well as the name, sprang from a suggestion in Edward Bellamy's novel, "Looking Backward," the book which describes Boston as the author believes it would be under nationalism in the year 2000. (See "Looking Backward.") A club of business men had been formed the previous autumn, whose motto was, "Spread the Book"; but finding unexpected success and interest, the

The
First Club

Nationalist movement was conceived and the first club organized. The leaders in the movement were Cyrus Willard, Sylvester Baxter, Charles E. Bowers, A. T. Devereux, Edward S. Huntington, Henry W. Austin, Miss Anna Page, and others, Mr. Edward Bellamy himself being in correspondence with the movers. The first officers of the first club were Charles E. Bowers, president; Edward Bellamy, first vice-president; C. F. Willard, secretary. The following declaration of principles was adopted:

The principle of the Brotherhood of Humanity is one of the eternal truths that govern the world's progress on lines which distinguish human nature from brute nature.

The principle of competition is simply the application of the brutal law of the survival of the strongest and most cunning.

Therefore, so long as competition continues to be the ruling factor in our industrial system, the highest development of the individual cannot be reached, the loftiest aims of humanity cannot be realized.

No truth can avail unless practically applied. Therefore, those who seek the welfare of man must endeavor to suppress the system founded on the brute principle of competition and put in its place another based on the nobler principle of association.

But in striving to apply this nobler and wiser principle to the complex conditions of modern life, we advocate no sudden or ill-considered changes; we make no war upon individuals; we do not censure those who have accumulated immense fortunes simply by carrying to a logical end the false principle on which business is now based.

The combinations, trusts, and syndicates of which the people at present complain demonstrate the practicability of our basic principle of association. We merely seek to push this principle a little further and have all industries operated in the interest of all by the nation—the people organized—the organic unity of the whole people.

The present industrial system proves itself wrong by the immense wrongs it produces; it proves itself absurd by the immense waste of energy and material which is admitted to be its concomitant. Against this system we raise our protest; for the abolition of the slavery it has wrought and would perpetuate, we pledge our best efforts.

In May, 1889, the magazine, *The Nationalist*, was started and continued two years. Great interest was manifested, and clubs were started all over the Union, particularly in California. In Jan., 1891, Mr. Edward Bellamy started *The New Nation*, a weekly published in the interests of the movement. This continued two years. In Jan., 1891, the secretary reported 162 clubs.

The movement in certain places early took a political channel. In one electoral district in California in 1890 a Nationalist candidate polled 1,000 votes. Rhode Island put out a Nationalist state ticket. The movement, however, politically early passed into the People's Party movement (which see).

Mr. Bellamy's novel has had, in this country alone, a sale of some half a million copies, and everywhere scattered the seeds of nationalistic thought.

Edward Bellamy has described the aims of Nationalism as follows:

We who call ourselves Nationalists believe that the solution of the industrial and social question is to be found, and is only to be found, in the logical evolution of the idea on which this nation is based, which is that of a union of the people in order to use the collective strength for the common welfare. We consider that this idea has always logically involved, when the time should be ripe, the nationalization of industry with a complete provision for the employment and maintenance of the people. When it shall in this manner have completed its evolution the nation will be, according to the hope and belief of the Nationalists, a great partnership for the general business of supporting and enjoying life, in which all the people shall be equal partners. It will be a universal insurance company, guaranteeing all its members against injustice, oppression, sickness, age, accident, and disability of every sort. It will be a mighty trust, holding the total assets of society—moral, intellectual, and natural—not only for the benefit of the present, but in the interests of future generations

and for the ultimate weal of the race, and looking to the ends of the world and the judgment of God. The membership of an individual in this great partnership, with all the rights it implies, will be absolutely fixt by the fact of his birth; the part he plays in its affairs being determined by his faculties and aptitudes.

There is nothing essentially new about the project of a society based upon and illustrating brotherly relations and obligations among men. The eventual realization of such a state of affairs has been the dream of humanity in all ages. Men have always acknowledged, even the most unjust, that if, instead of contending with one another for the means of livelihood, human beings could only be induced to unite their powers to secure and share a common welfare, the world would not only be a great deal better and a great deal happier, but likewise a great deal richer than it ever has been.

Heretofore, however, in the history of mankind the practical obstacles to such a change offered by existing conditions and institutions have been insuperable. It is the claim of Nationalists that these conditions have so changed and are so rapidly changing to-day as to render not only possible, but in the near future probable, a transformation of society which a generation ago it would have been chimerical to expect within any calculable period.

In view of the present extraordinary business situation, the unprecedented and portentous tendency of capital, the excusably alarmed and exasperated attitude of the masses of the people, we hold it not absurd to say that men now in middle age may live to see the present system give place to that grand industrial partnership of all for all which is the destined and sole possible solution of all labor problems and all social questions.

The greatest industrial revolution in history—greater by far in its destined consequences than the overthrow of the slave system at the South—is the present tendency to the monopolizing of the field of industry and commerce by the great capitalist organizations. The innumerable small business concerns which used to divide up every industry and trade are enduring a war of extermination at the hands of the great combinations of capital. The business of the people, which used to be in the hands of the people, is passing out of their hands into those of a small number of monopolists. It is in vain that we cry "Halt!" to this tendency. The economic necessities underlying and compelling the movement toward the consolidation of business are irresistible and beyond the power of legislatures to dam up with any quantity of statutes.

Americans who think are already beginning to see, and all Americans soon will be forced to see, that there are only two alternatives before the nation—either it must consent to turn over its industries, its entire business—and that means its social and political liberties as well—to a few hundred billionaires, or it must assume control of them itself; that is to say, it must nationalize them. Plutocracy or nationalism is the choice which, within a dozen years, at the rate things now are going, the American people will have wholly committed themselves to. Can any one who has faith in the people have any doubt as to what the choice between these alternatives will be?

In regard to the Nationalist program for introducing their ideas, Mr. Bellamy writes in *The Forum* (March, 1894):

Revolutions, however peaceful they may be, do not follow prearranged plans, but make channels for themselves, of which we may at best predict the general direction and outcome. Meanwhile Nationalists would prepare the way by a step-by-step extension of the public conduct of business, which shall go as fast or as slow as public opinion may determine.

In making any industry or service public business, two ends should be kept equally in view, viz.: first, the benefit of the public by more cheap, efficient, and honest service or commodities; and second, but as an end in every way equally important, the immediate amelioration of the condition of workers taken over from private into public service. As to the first point, whenever a service or business is taken over to be publicly conducted, it should be managed strictly at cost; that is to say, the service or product should be furnished at the lowest cost that will pay the expense and proper charges of the business. Nationalism contemplates making all production for use and not for profit, and every nationalized business should be a step in that direction by eliminating profit so far as it is concerned.

As to the improvement in the condition of the workers, which is the other and equal end to be sought in all cases of nationalizing a business, it is enough to say that the State should show itself the model employer. Moderate hours of labor, healthful and safe conditions, with provision for sickness, accident, and old age, and a system for the admission, promotion, and discharge of employees strictly based on merit, and absolutely exclusive of all capricious personal interference for political or other reasons, should characterize all publicly conducted business from the start. In particular cases, such as the clothing manufacture now so largely carried on by sweaters' slaves, decent wages and conditions might temporarily raise the price of ready-made clothing. If it

Principles Described

The Nationalist Program

did, it would only show how necessary it had been to make the business a State monopoly; and we may add that, on grounds of humanity, this is one of the first that should be brought under public management.

As to the general question of the order in which different branches of business should be nationalized, or (which is the same thing) brought under municipal or State control, ownership, and operation. Nationalists generally agree that chartered businesses of all sorts, which, as holding public franchises, are already quasi-public services, should first receive attention. Under this

Mr. Bellamy's Argument

head come telegraphs and telephones, railroads, both local and general, municipal lighting, water-works, ferries, and the like. The railroads alone employ some 800,000 men, and the employees in the other businesses mentioned may raise that figure to 1,000,000, representing, perhaps, a total population of 4,000,000; certainly a rather big slice of the nation to begin with. These businesses would carry with them others. For example, the railroads are the largest consumers of iron and steel, and national operation of them would naturally carry with it the national operation of the larger part of the iron business. There are about 500,000 ironworkers in the country, implying a population of perhaps 2,000,000 dependent on the industry, and making, with the railroad and other employees and their dependents, some 6,000,000 persons. The same logic would apply to the mining of coal, with which, as carrier and chief consumer, the railroads are as closely identified.

The necessity of preserving what is left of our forests will soon force all the states to go into the forestry business, which may well be the beginning of public operation of the lumber industry. If our fast vanishing fisheries are to be protected, not merely national supervision, but national operation, will soon be necessary.

In the field of general business, the trusts and syndicates, which have so largely stimulated the popular demand for nationalization, have also greatly simplified its progress. Whenever the managers of any department of industry or commerce have, in defiance of law and public interest, formed a monopoly, what is more just and proper than that the people themselves, through their agents, should take up and conduct the business in question at cost? In view of the fact that most of the leading branches of production have now been "syndicated," it will be seen that this suggestion, fully carried out, would go far toward completing the plan of nationalization.

Meanwhile the same process would be going on upon other lines. Foreign governments which have large armies, in order to secure quality and cheapness, usually manufacture their soldiers' clothing, rations, and various supplies in government factories. The British Government, which is most like our own, was forced, by the swindling of contractors, to go into making clothing for the soldiers in the Crimean War, and has since kept it up with most admirable results. If our government had manufactured the soldiers' supplies in the Civil War it would have saved a vast sum of money. It is highly desirable that it should forthwith begin to manufacture clothing and other necessities for its soldiers and sailors, and for any other of its employees who might choose to be so served, as it is safe to say all would; for goods as represented, proof against adulteration, and furnished at cost, would be a godsend even to the millionaire in these days of knavish trade. The policy of supplying the needs of government employees with the product of publicly conducted industries would bring about the whole productive and distributive plan of nationalization in proportion as the number of employees increased.

Among special lines of business, which ought at once to be brought under public management, are the liquor traffic and fire- and life-insurance. It is proposed that every state should immediately monopolize the liquor traffic within its borders, and open places of sale in such localities as desire them. The liquors should be sold at cost—that is to say, at rates to pay all expenses of the system—by state agents, whose compensation should be fixed without relation, direct or indirect, to the amount of sales. This plan would eliminate desire of profit as a motive to stimulate sales, would insure a strict regard to all conditions and requirements of the law, and would guarantee pure liquors. Pending the nationalization of the manufacture of liquors, the general government need be called on only for a transportation law protecting the states against illegal deliveries within their borders.

As to state life- and fire-insurance, this undertaking would need no plant and no backing save the state's credit on long-tested calculations of risks. It would be done at cost, in state buildings, by low-salaried officials, and without any sort of competitive or advertising expenses. This would mean a saving to fire-insurers of at least 25 per cent in premiums and of at least 50 per cent to life-insurers, and would, above all, give insurance that was not itself in need of being reinsured.

When private plants are taken over by a city, state, or nation, they should, of course, be paid for; the basis of valuation being the present cost of a plant of equal utility. This subject of compensation should be considered in view of the fact that the ultimate effect of nationalization will be the extinction of all economic superiorities, however derived.

The organization of the unemployed on a basis of state-supervised cooperation is an urgent undertaking, in line with the program of nationalism. The unemployed represent a labor force which only lacks organization to be abundantly self-sustaining. It is the duty and interest of the state to so organize the unemployed, according to their several trades and aptitudes—the women workers as well as the men—that their support shall be provided for out of their own product, which should not go upon the market for sale, but be wholly consumed within the circle of the producers, thus in no way deranging outside prices or wages. This plan contemplates the unemployed problem as being a permanent one, with periods of special aggravation, and as therefore demanding for solution a permanent and elastic provision for a circle of production and consumption complete in itself and independent of the commercial system. There is no other method for dealing with the unemployed problem which does not mock it.

In proportion as the industries, commerce, and general business of the country are publicly organized, the sources of the power and means of the growth of the plutocracy, which depended upon the control and revenues of industry, will be undermined and cut off. In the same measure, obviously, the regulation of the employment of the people and the means of providing for their maintenance will pass under their collective control. To complete the plan of nationalism, by carrying out its guaranty of equal maintenance to all, with employment according to fitness, will require only a process of systematization and equalizing of conditions under an already unified administration.

REVISED BY THE LATE EDWARD BELLAMY.

(For the objections to Nationalism, see SOCIALISM; section Objections to.)

REFERENCES: *Looking Backward*, by Edward Bellamy, Houghton, Mifflin & Co., 1887; *The Program of the Nationalists*, by Edward Bellamy, reprinted from *The Forum* for March, 1894; *Principles and Purposes of Nationalism*, an address by Edward Bellamy, delivered in Tremont Temple, Boston, Dec. 19, 1899.

NATIONALIZATION OF THE LIQUOR TRAFFIC

It has been proposed by the Nationalists in America (see NATIONALISM) to meet the enormous evils of the liquor traffic by putting the whole traffic into the hands of the government and having liquor sold under strict regulations, by government officials, in government dispensaries, and at cost. It is in this last respect that the Nationalist plan differs radically from the dispensary system (*q. v.*), from the Norwegian system (*q. v.*), and from all similar plans. All these plans provide for some one's making a profit from the sale of liquor. Nationalists, on the other hand, maintain that so long as there is a profit in the liquor traffic some one will be interested in the extension of the traffic, and that, conversely, the one way to kill the traffic is to kill the profits in it. They argue that this applies to government sales as well as to private sales. It will not do, they affirm, to allow even the government to make profits out of liquor, for if the government has an "interest" in the sales, it will lead to corruption. If, on the other hand, government made no profit out of the sales, it would be nobody's interest to sell, and therefore the strictest regulations concerning its sale could be both enacted and enforced. Sales could then be restricted to very limited hours; they could be made only to registered people or hotel guests, so that men could neither buy much at one place nor go from place to place and get a little. They could be absolutely prohibited to minors, to people whom physicians or their families declared unable to drink in moderation, etc. Yet the plan would allow other adults to drink in moderation who wish to do so. This, Nationalists urge, is the best law that can to-day be enforced. Prohibition (*q. v.*) they declare to be, in our large cities and even in most states, at present impracticable. The sale of liquor by government dispensaries, they claim, in South Carolina, Sweden, etc., has proved practical, and the best way to

restrict the traffic, and abolish its grossest evils. Only the Nationalists would go one step further and prevent even government from having any interest in the concern. To sell liquor at cost, the Nationalists claim, would not induce people to drink more, by making liquor cheaper; in the first place, because it is by no means clear that liquor would be cheaper. The cheaper forms of liquor are sold in such vast quantities to-day, and with such vile adulterations, that they can be sold very cheap, and at such a low margin of profit (the total sum of the profits, however, being enormous) that it is doubtful if the government could sell its limited quantities, which would be free from cheap adulterations, at any less price than to-day, and yet cover the cost. Cost price, therefore, would not necessarily be a lower price. Even if the price were slightly lower, the Nationalists urge that the small difference would scarcely increase temptation at all, because few, if any, except those wholly without money, are deterred from drink by the price. Again, government sales of liquors to registered persons would check all or almost all the treating that is to-day one of the greatest forms of the evil. The great argument for this system is, however, that it would at once cut off enormous money interest in the liquor traffic which to-day buys legislatures, corrupts politics, demoralizes the community, prevents temperance legislation, or mocks its enforcement. (See TEMPERANCE.)

Objections Considered

forms of liquor are sold in such vast quantities to-day, and with such vile adulterations, that they can be sold very cheap, and at such a low margin of profit (the total sum of the profits, however, being enormous) that it is doubtful if the government could sell its limited quantities, which would be free from cheap adulterations, at any less price than to-day, and yet cover the cost. Cost price, therefore, would not necessarily be a lower price. Even if the price were slightly lower, the Nationalists urge that the small difference would scarcely increase temptation at all, because few, if any, except those wholly without money, are deterred from drink by the price. Again, government sales of liquors to registered persons would check all or almost all the treating that is to-day one of the greatest forms of the evil. The great argument for this system is, however, that it would at once cut off enormous money interest in the liquor traffic which to-day buys legislatures, corrupts politics, demoralizes the community, prevents temperance legislation, or mocks its enforcement. (See TEMPERANCE.)

NATURAL MONOPOLIES: This is a phrase that has come into general use, particularly in the United States, for that class of monopolies which are asserted by the users of the phrase to have become monopolies on account of some inherent property. Prof. R. T. Ely, who perhaps has done more than any other writer to give currency to the phrase, says ("Socialism and Social Reform," pp. 262-300):

Monopolies may be divided into two main classes—natural and artificial; and natural monopolies again may be divided into two subclasses, namely, first, those businesses which are monopolies by virtue of the qualities inherent in the business itself; and second, those businesses which are monopolies by reason of the fact that the supply of the raw material upon which they are based is so limited in area that the entire supply can be acquired by a single combination of men.

Natural monopolies of the first class are the natural monopolies ordinarily discussed, and they include the means of communication and transportation, as well as the lighting service by gas or electricity of cities. Railways, waterways, irrigation works, telegraphs, telephones, are especially important. But street-car lines, whether they are surface lines, subways, or elevated railways, and the means of lighting cities, are scarcely less so. These are all primary businesses in modern society; businesses of every other kind are dependent upon them.

Character- ization

Natural monopolies of the second class are those which become monopolies because the supply of raw materials, consisting of natural treasures, is so limited that it can all be acquired by a single combination of men. Anthracite coal has been cited as an illustration; other similar cases could be instanced. It is said that it has been possible to purchase practically the entire supply of some raw materials found among barbarous or semibarbarous peoples; not so much, perhaps, on account of the limitation of the supply, as on account of the fact that it is easy to cheat them, and to buy a great supply at far less than its actual value.

Land is frequently called a natural monopoly, but this hardly seems correct. Monopoly implies management or ownership by one person, or by a combination of persons who can act as a unit. Anything of the kind does not exist with respect either to landownership, or to the use of the land for agricultural or building purposes. A genuine monopoly in the ownership or exploitation of land would mean the virtual slavery of all persons not interested in the monopoly. If the farmers of the world could act together as a unit, they could

force all others to give everything they might have for food, as the alternative would be starvation. "What will not a man give for his life?" But such a combination is an impossibility, and every attempt to effect a combination, even on a comparatively small scale, with respect to a single staple, like wheat or cotton, has thus far proved a failure.

The following consideration of the subject is taken from various statements by Professor Ely. Concerning the difference between "natural and other monopolies," he says (*idem*, p. 217):

Socialists assert that every business is a natural monopoly, and that the expression itself, "natural monopoly," is as much out of place as would be the expression "natural adults" with reference to human beings. Every human being becomes in time an adult, and so, they say, every business becomes in time a monopoly. Proof is sought in a long list of trusts and combinations which have been more or less successful. When we look into this list of trusts in manufactures, however, we quickly ascertain that few of them have achieved anything like complete monopoly; and if we examine the list of unsuccessful attempts to form trusts, we shall discover that this is longer than the list of partially successful trusts. What we ascertain in reality is a demonstration of the advantages of production on a large scale, and a few attempts to secure a monopoly which have been partially successful, and a far larger number of cases of failure to establish monopoly in manufacturing industries. So far as any historical inductive proof is concerned, we must say that it is, as yet, lacking. The careful thinker will at least demand time for further observation. He will tell us to wait and see what tendencies are revealed by subsequent industrial development. If we turn to deductive proof, however, no convincing arguments have been advanced to support the hypothesis, either that unification of manufactures is, generally speaking, inevitable, or even possible. We must not overlook the immense difficulty of a management so watchful, so alert, so full of resources, so fruitful in initiative and enterprise, that it can permanently secure better results than a number of smaller and competing manufacturers.

As a proof that natural monopolies are such, we are told (*idem*, pp. 263-266):

The proof that these pursuits are natural monopolies is twofold; namely, deductive and inductive, or historical. The deductive proof takes account of characteristics of businesses of the kind mentioned, and discovers that businesses with these characteristics must necessarily become monopolies. Their main characteristics are three: They occupy peculiarly desirable spots or lines of land; second, the service or commodity which they supply is furnished in connection with the plant itself; and, in the third place, it is possible to increase the supply of the service or commodity indefinitely without proportionate increase in cost. Any business which has these qualities tends to become a monopoly by virtue of its inherent qualities, and it must become such in time.

Inductive or historical proof calls attention to actual experience. It is found that sooner or later attempted competition always gives way to combination and consolidation.

The gas business furnishes an excellent illustration, because the experience with respect to this is so superabundant, and because, furthermore, as the geographical area within which the business is conducted is small, the movement toward monopoly has always been comparatively rapid. Competition in the gas business has been attempted in countries with all kinds of political government, and under every circumstance which can be imagined. It has been tried repeatedly with the most solemn promises on the part of those starting rival companies, that competition would be genuine and permanent. But the nature of the business as monopoly has been strong enough to overcome every obstacle and guaranties have not been worth the paper on which they have been printed. It is probably not too much to say that competition has been tried a thousand times in different countries, and no one can yet point to one single instance of permanently successful competition. It would seem that a thousand experiments should satisfy any one. The telegraph business also furnishes good illustration. Competition in telegraph service was tried many times in England, but always resulted in monopoly; and it has been tried perhaps a hundred times in the U. S., but the tendency to monopoly has been too strong.

Proof of Natural Monopolies

Competition of various sorts has been tried with respect to railways. . . . America will be held to offer the greatest difficulties in the way of the acceptance of a theory of monopoly in the railway business, but the difficulties only spring from the fact that it is a vast country in which the railway development is yet far from complete. Combination and consolidation are going forward every day, and it is simply a question of time when monopoly will be secured in the U. S. as well as elsewhere. Even now it would require a small book simply to print the names of railway companies which have been absorbed by other companies, and have ceased to exist.

So conceiving of natural monopolies, those who use the phrase advocate that all natural monopolies should be at least owned and usually (tho not always) operated by the community. Professor Ely writes ("An Introduction to Political Economy," pp. 252, 253):

What shall be our policy? Monopoly is inevitable. Private monopoly is odious. Public monopoly is a blessing, and the test of experience approves it. Again and again it has been tried with fear and trembling, but the results have in the long run been gratifying.

Treatment Public ownership and management of railways have in Germany succeeded in many respects even better than their advocates anticipated, and the opinion of experts in Germany favors them almost if not quite unanimously. The writer happens to know of no exception. . . . It was long ago said by a shrewd English engineer that where combination is possible competition is impossible. Combination is always possible in the case of undertakings which are natural monopolies. It is inevitable, for it is not only cheaper to do a given amount of business by a monopoly than by two or more concerns, but very much cheaper. If two gas companies in a city, having each a capital of a million dollars, operating separately are able to make 10 per cent profit, when combined they will make much more than 10 per cent; possibly even 15 or 20 per cent. There is a force continually at work drawing them together. It works as constantly if not as uniformly as the attraction of gravitation.

This does not, however, according to this school of thought, always imply public operation ("Socialism and Social Reform," p. 293):

It does not appear evident at once that the collective management of the property collectively owned is essential. If the anthracite coal-mines were owned by the state or by the nation, satisfactory results might, perhaps, be secured by leasing the land, or by allowing individuals or companies to mine coal freely on the payment of a royalty which would absorb any economic surplus above the normal returns to labor and capital.

Concerning the advantages of the public ownership of natural monopolies, we are told, first, that the socialization of natural monopolies would lead to the better utilization of productive forces and the avoidance of wastes due to competition. A railroad manager is quoted as saying that even now it would involve an annual saving of \$200,000,000 if the railways of the U. S. were managed as a unit. Says Professor Ely ("An Introduction to Political Economy," p. 254):

The construction of only two needless parallel lines of railway in the U. S., the West Shore and the Nickel Plate, extending together from New York to Chicago, wasted \$200,000,000; a sum sufficient

Advantages to build 200,000 homes for a million people. Probably the waste in railway construction and operation in the U. S. during the past fifty years would be amply sufficient to build comfortable homes for every man, woman, and child now in the country.

Every city shows that attempted competition eats up a large part of what might be profit. Gas can well be supplied for a profit in great cities, if the business is a perfect monopoly, for seventy-five cents.

A second advantage claimed is that it would tend to decrease industrial crises. (See **CRISES**.)

A third advantage is that it would purify politics. (See **CITY**; **MUNICIPALISM**; **SOCIALISM**.)

Fourth, it would tend to the utilization of inventions. (See **COMPETITION**.)

Fifth, it would aid distribution. (See **WEALTH**.) These advantages we consider under their proper heads. But besides these are indirect advantages perhaps even greater, the breaking up of the great monopolies dependent upon natural monopolies (see **COAL**; **STANDARD OIL MONOPOLY**), and the abolition of railroad favoritism (see **RAILROADS**).

Concerning the purchase of private monopolies, Professor Ely says (*idem*, p. 289):

The difficulties of payment for these monopolistic undertakings are often mentioned. It must be remembered that public ownership increases their value, because it produces unification in these enterprises, and shuts off the waste of future competition. Frequently public ownership makes it a possibility to unite advantageously several services and thus effect a saving. Very often a municipal electric lighting plant is connected with the public water-works, and results in a better utilization of public property, and of the services of those already in the employment of the municipality. The railways, which include the larger part of the property of the kind under consideration, are generally brought forward as affording the chief illustration of the difficulties of acquisition by the government. The purchase of these practically means the conversion of railway stocks and bonds into government bonds, and while it would add enormously to the public debt, it would add to a still greater extent to the public resources. Besides, it must always be remembered that the change could not be made in a single day.

Reformers are often inclined to urge that the payments for railways, telegraphs, etc., should only be sufficient to duplicate the existing plant, and this generally means much less than the selling value of the plant. They make a serious mistake in taking this position. As a matter of policy, this course is not to be recommended, because it needlessly antagonizes such a large proportion of the population of the country. Those who are asked to part with their property at a price less than the market value will feel themselves aggrieved, and will oppose the reform in every way in their power. The plan proposed is also objectionable on the score of justice. The value which property of this kind has in excess of the cost of duplication of the plant is largely due to a public policy which has been approved by a majority, and a vast majority, of the people of the U. S. A large capitalization, so far as it exceeds the actual value of the plant, very frequently represents only the waste due to attempted competition, and this attempted competition has been encouraged in every way, directly and indirectly, by the general public. Even when such is not the case, the possibility of an excessively large income, which has brought about the large capitalization, has been due to a considerable extent to failures of the legislature to make proper laws, and of the other public authorities adequately to enforce existing laws. Now, if the property is appraised simply at the cost of duplication of the plant, it would make a portion of the community bear the entire burden of a false public policy, whereas, as the whole of the public is to blame, the burden should be diffused among the people as a whole. If it is necessary to raise large sums to pay off the debt necessitated by the acquisition of enterprises of this kind, it could be done through a wisely devised system of inheritance taxes.

When we consider the difficulties in the way of the socialization of natural monopolies, we must always remember what the alternative is. These difficulties are real, but the difficulties of the present system are even greater.

For the ways in which Socialists and nationalists would obtain the ownership of private monopolies, see **RAILROADS**, section **Nationalization of**. We are here considering simply the views of those who believe in the socialization of "natural monopolies" alone. For examples of the practical working of the socialization of national monopolies, see **BERLIN**; **BIRMINGHAM**; **GLASGOW**; **LONDON**; **ELECTRICITY**; **GAS**; **POSTAL SYSTEM**; **RAILROADS**; **STREET-RAILWAYS**; **TELEGRAPHS**; **TELEPHONES**; **POSTAL SAVINGS-BANKS**, etc., etc. Professor Ely says (*idem*):

The test of experience seems to be decisive. The same objections which we now hear against the nationalization of railways in the U. S. were heard fifteen years ago in Prussia, and the opinion of the people was divided.

Experience Now one who travels in Germany, and talks with the people, finds it difficult to discover any one adverse to public ownership and management of the railways. There are some who would like to go back to the old system; but they are few indeed, and they are very generally those who would be apt to derive some private advantage from the change. Professor Cohn of the University of Göttingen voices a general sentiment when he says that, in Prussia, the question of State ownership and management of railways has been settled by the test of experience. The people of the Australasian colonies are equally clear in regard to the advantage of public ownership and operation of railways. There is considerable enthusiasm in regard to the results of such ownership and operation in New Zealand; and recently the editor of an economic periodical complained because he could not find any one in Australia to write an article adverse to the government ownership and management of railways.

For the views of those who oppose the socialization of national monopolies, see **INDIVIDUALISM**.

NATURAL RIGHTS: These may be, in general, defined as rights or asserted rights based on what are declared to be laws of nature, as distinguished from rights grounded on conventional relations or positive enactments. The phrase, however, is used by different writers and different schools of thought in such different meanings, or shades of meaning, that one must ask the exact sense in which a writer uses the phrase before one can be sure that he understands his exact thought. The use of the phrase, and the value of the ideas embodied in it, will be best seen in following the development of the theory of natural rights through its several phases. Popularly identified with the revolutionary political writers of the eighteenth century, and particularly with Rousseau, the theory is really as old as political thinking and by no means dead to-day.

The germs of the theory may be found in the Greek sophists and particularly in Aristotle, altho, as Professor Ritchie has pointed out in his latest book, "Natural Rights," Aristotle did not hold the theory usually held to-day by those who use the phrase. He speaks of *répos lélos* and *répos nékos*, meaning by the former any law which the State establishes for itself, and is therefore peculiar to it, and by the latter, the law which is conformable to the dictates of nature and

appears to be recognized among all men ("Ethics," book v., chaps. vi., vii.; "Rhetoric," book i., chaps. x., xiii.). Aristotle's distinction is not between laws based upon nature and laws based upon human enactments. To Aristotle, as to all the Greeks, the State was a natural product. He simply distinguishes between laws peculiar to one State and universal laws common to all.

Some of the Greek Cynics, however, held a theory more close to the modern doctrine. Antisthenes says: "The wise man will live not according to the established laws, but according to the law of virtue" (quoted by Ritchie, *idem*, p. 33). Diogenes was more extreme. He disowned the State and considered himself "a citizen of the world." He opposed all conventions and preferred his tub to a house. From this Cynic school came the more balanced Stoic, with its maxim, "Live in harmony with nature." Nature, however, is not the whim of the individual; it is the divine element in the universe, and human laws may themselves be a manifestation of it. In Rome, Cicero popularized this view. "Universal consent is the voice of nature" ("Tusc.," xv., § 35). Hence the Latin *jus gentium* and the *jus civile* are to be interpreted as almost exact translation of the Greek *nékos répos* and *lélos répos*. One great jurist, Ulpian, held that the *jus naturale* applied to animals as well as men: "It is that which nature has taught to all animals" (embodied in Justinian's Institutes, i., tit. 2). From the Roman

law the distinction passed into medieval thought. Aquinas's conception of nature was derived from Aristotle, but he adds Cicero's conception of the *lex nature*. The natural law becomes a fixt law implanted in the human heart and in the universe, as contrasted with both the laws of men and the revealed law of God. Aquinas says, "Natural law is nothing else than the participation in the eternal law of the mind of a rational creature" ("Summa," i., sec. qu. 94, art. 2). Medieval thought made a sharper distinction than the Roman jurists between the *jus civile* and the *jus gentium*. When Justinian codified the civil law, the law of nations was more sharply distinguishable from it. It became a distinct ideal code. To it men could appeal. First the authority of human law was questioned by the appeal to the Church. When the authority of the Church was shaken, the way was cleared, says Ritchie (*idem*, p. 42), "for revolution in the name of nature."

Through Grotius and Puffendorf the medieval distinction came to Locke, and with him played an important part. It lies in the background of all his theories. He says ("Treatise on Civil Government," ii., § 95): "Men being by nature all free, equal, and independent, no one can be put out of this estate and subjected to the political power of another without his own consent." He talks of a "state of nature" "a golden age" which has "a law of nature to govern it" ("Civil Government," ii., § 6). Civil society with

Locke is constituted by a compact of the original members; a compact renewed from generation to generation in the person of every citizen when he comes to an age of discretion to choose his allegiance. The sovereignty of society is limited, too, to the ends for which it was conferred. It is not hard to see outlined here all the essentials of Rousseau's social compact. Locke from this basis justified the revolution of 1688. Another English writer from the same principles deduced a condemnation of rebellion. Hobbes, like Locke, starts out from a state of nature. Men are by nature equal and live in a state of mutual fear, enmity, and war. This is intolerable. Hence, by a law of reason which is also "a law of nature," they mutually agree to surrender their natural rights to some sovereign man or body of men to govern over them. Hence, having surrendered their natural rights, they no longer have them, but must obey the sovereign power. From these English theorists sprang alike Rousseau's social contract and the "inalienable rights" spoken of in the American Declaration of Independence. Professor Ritchie has shown that the American "inalienable rights" came not from France, as is usually thought, but from England.

A bill or declaration of rights exactly analogous to the French declaration is found in most of the state constitutions of the U. S. originated after 1776, while the French Declaration of the Rights of Man was promulgated in 1791.

The Bill of Rights of Virginia (June 12, 1776) declares, "That all men are by nature equally free and independent and have certain inherent rights, of which, when they enter into a state of society, they cannot by any compact deprive or divest their posterity; namely, the enjoyment of life and liberty, with the means of acquiring and possessing property, and pursuing and obtaining happiness and safety. That all power is vested in, and consequently derived from the people, that magistrates are their trustees and servants and at all times amenable to them." The Declaration of Independence of the U. S., signed only a few days later, almost repeats the words, when it says: "We hold these truths to be self-evident; that all men are created equal; that they are endowed by their Creator with certain inalienable rights; that among these are life, liberty, and the pursuit of happiness; that, to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed."

This theory was in the air—American and English air as truly as Gallic. Virginia, says Bancroft, "moved from charters and custom to primal principles; from a narrow altercation about facts to the contemplation of immutable truths. She summoned the eternal laws of man's being to protest against all tyranny" ("History of the United States," 5th ed., viii., p. 383). These metaphysics we have traced historically through Locke. But as Professor Ritchie says (*idem*, p. 6), "the theory of natural rights was not Locke's invention. Neither he nor Jean Jacques can claim the credit of having 'discovered' the lost title-deeds of the human race." The theory of natural rights is simply the logical outgrowth of the Protestant revolt against the authority of tradition, the logical outgrowth of the Protestant appeal to private judgment." In the Middle Ages privileges were claimed because of some real or fancied authority in the past. There were three great authorities, the Bible, Aristotle, and Justinian. Yet in each of these could be found some elements of the law of nature. The Levellers appealed to the law of nature. Thomas Edwards (in his "Gangrena," pt. iii., p. 16) says these "sectaries" held that "by natural birth all men are equally and alike born to like propriety [property], liberty, and freedom; and as we are delivered of God by the hand of nature into this world, every one with a natural innate freedom and propriety, even so we are to live every one equally and alike, to enjoy his birthright and privilege." Again Edwards says of them (*idem*, p. 20), "tho the laws and customs of a kingdom be never so plain and clear against their ways, yet they will not submit, but cry out for natural rights derived from Adam and right reason." This doctrine Ritchie traces back to Wyclif and his poor priests. Wyclif argued (see "De Civili Dominio," edited by R. L. Poole, pref., pp. xxii-xxiv) that "every one in a state of grace has real lordship over the whole universe," and deduces from this community of property. He held this only of the saints, but John Ball (q. v.) and others popularized this when they sang:

Protestantism

"When Adam dalf and Eve span,
Who was then the gentleman?"

Says Ritchie: "In the Puritan revolution of the seventeenth century, the appeal to historic right was replaced by an appeal to natural rights. The struggle for parliamentary liberties led some men to go behind parliaments and charters, just as the independent study of the Bible led some men to go behind the authority of the Bible and to rely on the authority of 'the inner light' alone. This," Ritchie continues, "is the logical outcome of Protestantism, however unacceptable to the majority of those calling themselves Protestants; however unsatisfactory and dangerous in the eyes of those who were more influenced by the historic spirit and who realized, in more or less intelligent fashion, the necessity of

Locke

social cohesion and continuity." Ireton ("Clarke Papers," i., p. 307) complains to Protestant extremists, "If you do, paramount to all constitutions, hold up this law of nature. I would fain have any man show me where you will end." Puritan England thus produced the theory, but it was developed mainly in the American Bills of Rights and the French Revolution. The convention at New York, Oct., 1765, while protesting loyalty to King George, declared "that trial by jury is the inherent right and invaluable right of every British subject in these colonies," entirely in the spirit of the English Bill of Rights of 1689. In the Declaration of Rights of the Philadelphia Congress of 1774, appeal is made not only to "the principles of the English constitution and the several charters or compacts," but to "the immutable laws of nature," including the right "to life, liberty, and property." In the declaration of July 4, 1776, no more is said of the rights of British subjects, but we have "inalienable rights" which come from God. We now understand the development of the theory in France better. It did not take, even here, an invariably atheistic form. The French declarations of 1791 and 1793 are proclaimed "in the presence of the Supreme Being." Nor is the theory in France by any means peculiar to Rousseau. It is common to almost all the eighteenth-century writers and largely traceable to English philosophy, appearing through Diderot and the Encyclopedists. All the tendencies of the time—religious, scientific, philosophical, and political—favored the theory. It was developed on its religious side not only by the individualism of the Reformation, in the doctrines of the right of private judgment and Luther's salvation by faith, but quite as much by Calvin's sovereignty of God, since, by making man the predestinated subject of God's omnipotent rule, the individual is placed above all the laws of State or government. The same exaltation of the individual was developed by the growing spirit of science, discovery, and invention. Men were breaking away from all covenants, theories, and institutions of the past. This was peculiarly true in politics. Instituted law was identified with despotism. It was popular to place above such law the "natural rights of man."

France

The view was particularly favored by the Physiocrats, who deduced from it economic rather than political conclusions. Quesnay's "Le Droit Naturel" is a classic of this theory, and begins by laying down the proposition that natural right is "the right which a man has to do the things which are fit for his enjoyment." It will be thus seen into what ready soil Rousseau dropped his brilliant words. So far from his being the originator of the theory, it is not even clear that he held it, in its extreme form, in his more careful writings. Professor Ritchie argues that it scarcely appears in his little read "Social Contract" (1763), but has been taken mainly from his more popular, tho' weaker, "Discourse on the Origin of Inequality among Men" (published 1754). This discourse, however, belonged to Rousseau's most brilliant period, and tho' its views seem seriously modified in the later "Social Contract," its teachings, and not the more careful statements of the latter, have become identified with Rousseau. The theory, however, in its essence, is contained in both books. We present Rousseau's statement as Professor Huxley has summarized it ("Nineteenth Century," Jan., 1890), that: First, All men are born free, and politically equal and good, and in the "state of nature" remain so; consequently, it is their natural right to be free, equal, and (presumably their duty to be) good. "Contrat Social," v. pp. 98-99. Mussey Pathay's edition, 1826. Second, All men being equal by natural right, none can have any right to encroach on another's equal right. Hence no man can appropriate any part of the common means of subsistence—that is to say, the land or anything which the land produces—without the unanimous consent of all other men. Under any other circumstances, property is usurpation ("Discours," pp. 257, 258, 276). Third, Political rights, therefore, are based upon contract; the so-called right of conquest is no right, and property which has been acquired by force may rightly be taken away by force ("Discours," pp. 276-280).

The relation of such theories to the French Revolution is easy to see. The famous French Declaration of the Rights of Man was proclaimed in 1791, and undoubtedly embodied the principles of the Revolution, altho these principles can by no means be considered to have caused this revolution. The French Revolution simply accomplished suddenly and in bloodshed what England had gained quietly and with legal procedure. Nevertheless, the French Revolution called all men's attention to the dangerous aspects of the theory of natural rights. In England, where the theory had been largely developed, it was strenuously attacked, and with such success that to-day most English and American publicists consider it exploded. That this is not the case we shall later see; but it is true that the overwhelming judgment of modern English and

Criticism

American scholars is against the theory. This is probably mainly due to the development of the modern scientific and historic spirit, which asks for induction from facts, not for brilliant generalities from metaphysical arguments about unproven and unprovable "natural laws." The theory, however, was first attacked by statesmen and philosophers rather than by

scientists. In brilliant rhetoric Burke argued its dangerous and baseless nature. Paine, in his even more brilliant and rhetorical "Rights of Man," answers Burke; but thought and above all, science were to answer Paine. Bentham more coldly argued its uselessness, and then science came to condemn it and ask what facts teach, not what different people assert to be "natural." The argument against it to-day is mainly based on the fact that nobody can prove what are natural rights. Modern disbelievers in the theory assert that what are called "natural rights" are simply what various men believe to be the ideal of what should be man's social status. Says Professor Ritchie (idem, p. 80), "Natural rights, when alleged by the would-be reformer, mean those rights which, in his opinion, would be recognised by the public opinion of such a society as he admires. . . . They are the rights which he thinks ought to be recognized; i. e., they are the rights sanctioned by his ideal society, whatever that may be." Further, Professor Ritchie says (idem, p. 81), "If we go back to the ordinary unreflecting opinions of mankind in comparatively primitive conditions, we shall find that those rights which people think they ought to have, are just those rights which they have been accustomed to have, or which they have a tradition (whether true or false) of having once possessed. . . . Thus to the average Greek, slavery undoubtedly seemed a 'natural' institution; it was familiar to him, and he did not know of any civilized society without it. . . . A Turk, a German, an American, would give somewhat different accounts of this natural status. The 'natural' in each case may, perhaps, be pitched a little above the average usage of the society in question; it represents the expectations of the society, of which expectations fulfilment may indeed fall short." Hence, as many modern thinkers have shown, the theory of "natural rights" may be made to support any theory. It is usually used to base an argument against any law or action of the State that the individual does not consider wise or right. It is used by anarchists to condemn existing inequalities of social conditions, and by conservatives to check attempts on the part of government to remedy those inequalities. The Liberty and Property Defense League plants itself on the same natural rights as did Tom Paine. In the name of natural rights Henry George argues that every man has a right to what he produces, and only to that, while Matthew Arnold says: "An author has no natural right to a property in his production. But, then, neither has he a natural right to anything whatever which he may produce or acquire" (*Fortnightly Review*, vol. xxvii., p. 322). Such contradictions prove to the critics of the theory its impracticability, baselessness, and unreality.

Says Jevons in "The State in Relation to Labor": "The first step must be to rid our minds of the idea that there are any such things as social matters as abstract ideas." Mr. Spencer quotes a writer "of high repute" as saying "to explain once more that there is no such thing as 'natural right' would be a waste of philosophy." Rousseau himself, in the preface to his "Discours," says: "It is more difficult than one would suppose to take the precautions necessary to basing an argument upon it [the doctrine of natural rights]. Professor Huxley shows that nature's laws 'contain in reality nothing but a statement of that which a given being tends to do under the circumstances of its existence.' A tiger has a natural inclination to eat men; certain cannibals are said to have the same inclination. Have they a natural right to eat men? As used against governments, the advocates of 'natural rights' and 'a state of nature,' which is supposed to be better than the organized state, forget what Aristotle did not forget, that the State itself is natural. It is halting metaphysics and stranger theology to assert that God made the country and man made the city. Is the plowed land unnatural? Is the city street contrary to human nature? The view held to-day by most publicists, in place of the theory of natural rights, is stated by Prof. John W. Burgess, as follows:

"The revolutionists of the eighteenth century said that individual liberty was a natural right; that it belonged to the individual as a human being, without regard to the state or society in which, or the government under which, he lived.

But it is easy to see that this view is utterly impracticable and barren; for if neither the State, nor the society, nor the government defines the sphere of individual autonomy and constructs its boundaries, then the individual himself will be left to do these things, and that is anarchy pure and simple. The experience of the French Revolution, where this theory of natural rights was carried into practice, showed the necessity of this result. These experiences drove the more pious minds of this period to formulate the proposition that God is the source of individual liberty. *Dieu et mon droit* was the mediaeval motto made new again. But who shall interpret the will of God in regard to individual liberty? If the individual interprets it for himself, then the same anarchic result as before will follow. If the State or the Church or the government interprets it, then the individual practically gives up the divine source of his liberty. . . . We may express the most modern principle as follows: The individual, both for his own highest development and the highest welfare of the society and State in which he lives, should act freely within a certain sphere; the impulse to such action is a

The Opposing View

universal quality of human nature; but the State, the ultimate sovereign, is alone able to define the elements of individual liberty, limit its scope, and protect its enjoyment. The individual is thus defended in this sphere against the government by the power that makes and maintains and can destroy the government, and by the same power through the government against encroachments from every other quarter. Against that power itself, however, he has no defense. It can give and it can take away. The individual may ask for liberties which it has not granted, and even prove to the satisfaction of the general consciousness that he ought to have them; but until it grants them, he certainly has them not. The ultimate sovereignty, the State, cannot be limited, either by individual liberty or governmental powers; and this it would be if individual liberty had its source outside of the State. This is the only view which can reconcile liberty with law, and preserve both in proper balance. Every other view sacrifices the one to the other" ("Political Science and Constitutional Law," vol. i., book ii., chap. i.).

Such is the ordinary view held at present by the large majority of thinkers in England and the U. S.

Yet there are a few and some of the most brilliant minds in England and America, and a whole school of thinkers upon the Continent of Europe, who do hold still to the doctrine of natural rights. Herbert Spencer has given the weight of his name to the doctrine. In his "Social Statics" he holds that all rights are derived from a single first principle, which he calls "the law of equal freedom." This principle is "that every man may claim the fullest liberty to exercise his faculties compatible with the exercise of like liberty by every other man" (chap. v., § 3), or, as he elsewhere expresses it, "every man has freedom to do all that he wills, provided that he infringes not the equal freedom of any other man" (chap. vi., § 1). Accordingly, he says: "Rights are nothing but artificial divisions of the general claim to exercise the faculties—applications of that general claim to particular cases; and each of them is proved in the same way by showing that the particular exercise of the faculties referred to is possible without preventing the like exercise of faculties by other persons." His development of this theory is well known. (See SPENCER.)

In Germany the idea of *Naturrecht* is the root idea of German jurisprudence. Professor Pollok says of this school, that its authors "throw their main strength on investigating the universal moral and social conditions of government and laws, or, at any rate, civilized government and laws, and expounding what such governments and laws are, or ought to be, so far as determined by conformity to these conditions." English writers, he says, are apt to despair of systems of philosophy built up on somebody's conception of "things as they ought to be," necessary inferences from the facts of nature, "natural laws" which, nevertheless, "never have been and probably never will be perfectly discovered. But," he adds, "allowance must be made for difference in meaning. We may discover this mysterious and terrible *Naturrecht* to be no worse than a theory of government and legislation; or, to preserve better the wide generality given to it by its authors, a kind of teleology of the State and its institutions."

In England Professor Lorimer in his "Institutes of Law," with its subtitle, "A Treatise of the Principles of Jurisprudence as Determined by Nature," most nearly represents the German school. But the characteristic modern English, and especially the American use of the theory, is the use made of it in politics by Jeffersonian Democrats, with their strict limitation of the power of the State, and in economics by Henry George and his followers, when they hold that each man has a natural and a divine right to what he produces, and to that only, so that land values should be held in common, since no individual has produced them, but that each individual should be allowed private property in other things. (See SINGLE TAX.) Professor Ritchie, in his volume above referred to, considers the specific natural rights most commonly claimed: the right of life, of liberty, of toleration, of public meeting and association, of contract, of resistance to oppression, of equality, of property, of pursuing and obtaining happiness. He shows, however, that nations like the U. S., most imbued with the theory of natural rights, have not scrupled to go contrary to them when it was popular. Protestants, who cannot understand why Roman Catholics should not allow legal divorce, are quite ready to suppress Mormon plural marriages by law. To sum up, the theory of natural rights is considered by its critics vague and useless; its truth to lie in its witness to the belief in a divine or general ideal of society toward which men are ever pressing.

NAUMANN, FRIEDRICH: Christian Socialist and politician; born March 25, 1860, in Störmthal near Leipsic. After proper preparation in the gymnasium he entered the university at Leip-

sic, later Erlangen, and was appointed vice-superintendent at the Rauhe Haus, 1883-85. From 1886-90 he was pastor at Langenberg; 1890-95 he was the missionary of the Inner Mission at Frankfurt-on-the-Main, where he came in touch with the working men of all grades. He separated from the Christian Social Party because he was more democratic, and founded, 1895, a new party called the *National Sozialen*, with Paul Göhre (q. v.). For the furtherance of this object he founded a paper, *Die Hilfe*, and later *Die Zeit*; since the party dissolved in 1903 Naumann joined the Liberal Party, and has since been one of the foremost agitators in behalf of better industrial and political conditions of working people. Author: "Arbeiterkatechismus," 1889; "Was heisst Christlich-Sozial?" 1894-96; "Soziale Briefe an reiche Leute," 1894; "Jesus als Volksmann," 1894; "Demokratie und Kaiserthum," 1900; "Neudeutsche Wirtschaftspolitik," 1902; "Briefe über Religion," 1903, and of other books. Address: Hohenfriedstrasse, Berlin-Schöneberg, Germany.

NAVAL POWERS: (See MILITARISM.) The following table gives the latest data concerning the naval strength of the great nations, both present and prospective. (Supplied by the Office of Naval Intelligence, Navy Department):

WAR-SHIP TONNAGE OF THE PRINCIPAL NAVAL POWERS
Number and displacement of war-ships, built and building, of 1,000 or more tons, and of torpedo craft of more than 50 tons.

NEGRO, THE (IN THE U. S.): During the past twenty years the Southern negro has made substantial progress in many directions, has responded unmistakably to the demands of American civilization. Some measure of this progress is to be found in the answers to these questions: (1) Has the negro, succumbing to a competition too severe, exhibited tendencies to die out, as has, for example, the Maori population of New Zealand? (2) Has the negro—with reasonable rapidity—become more intelligent? (3) To what extent has the negro bought homes? (4) In his occupations is the negro advancing to higher levels?

The facts show pretty plainly that, severe to him as is competition with many races which centuries have made more efficient, the negro holds his own with dogged persistence. In 1880 there were 6,580,793 negroes in this country; twenty years later we find this number increased to 8,833,994, an increase of 2,253,201 souls, or 34.2 per cent. Certainly a new-born race that can merely maintain its numbers in the face of the severest competition the modern world can boast, deserves praise; but what shall be said of my race? It has not merely maintained its numbers, but has actually grown 34.2 per cent in twenty years. The red Indian of America and the Maori of New Zealand are not precedents for the negro of the United States. Neither death nor deportation will benevolently assimilate the American negro into non-existence; the negro is here and here to stay. His well-being and continued progress are essential to the welfare of the republic.

This solidarity of interest has been splendidly recognized by the white people of the South. I believe that the Southern white people realize more and more clearly the fundamental idea of the American common school—that all the property of the State should educate impartially all the children of all the people. It is not merely the man who enters the tax office who really pays the taxes; the laborers, each of whom pays one

¹ Battle-ships, first class, are those of (about) 10,000 or more tons displacement.

² Includes smaller battle-ships and monitors.

³ All unarmored war-ships of more than 1,000 tons are, in this table, classed according to displacement as cruisers. Scouts are considered as cruisers in which battery and protection have been sacrificed to secure extreme speed. The word "protected" has been omitted because all cruisers except the smallest and oldest now have protective decks.

⁴ Omitting the *Léna*.

N.B.—The following vessels are not included in the tables: Those over twenty years old, unless they have been reconstructed and rearmcd since 1900.

mill more to the pound for a commodity because of a license tax, really pay the license tax, however indirect the payment. The moral idea that underlies the American common school and the actual incident of taxation—these two things are winning increasing recognition in every one of the Southern States. Moreover, the value of land is largely determined by the relative intelligence and consequent efficiency of the laboring population, and the negro constitutes a very large percentage of the South's labor. Since 1880 \$105,807,930 have been spent for the negro schools in the former slave states. In the school year 1879-80, \$2,120,485 were spent for colored schools, and in 1900-1, \$6,035,550, an increase of \$3,915,065, or almost 85 per cent. In 1879-80 the expenditure per capita of school population for the colored was \$1.01, but in 1900-1, \$2.21. It is true that in the latter year the white child received \$4.92, or considerably more than twice the amount received by the colored child. However, the whole South is heartily interested in the cause of negro education.

Negro illiteracy is a stain which the schools are rapidly washing away. Of the population ten years of age and over, 70 per cent of the colored were illiterate in 1880, 57.1 per cent of the negro were illiterate in 1890, but only 44.5 per cent of the negro in 1900. Despite an increase between 1890 and 1900 of 1,087,000 in the negro population ten years of age and over, there was a decrease of nearly 190,000 in the number of negro illiterates. It is true that among Southern negroes illiteracy is more than four times as common as among Southern whites, but the South is determined to lessen this immense handicap upon the negro just as rapidly as possible. To an appreciable extent progress in literacy indicates progress in intelligence, in character, in general efficiency.

The schools have greatly aided the negro in the buying and the proper maintenance of homes. The white or black man, by the sweat of whose brow a home has been bought, is, by virtue of that act, an infinitely better citizen. In 1860 the negro was without a home of his own, without capital, without thrift, with nothing like proper appreciation of the value of a home. And yet in 1890, of the homes occupied by negro heads of families, 18.7 per cent were owned—an immense advance in civilization, and all in thirty years. Moreover, of the homes thus owned 88.8 per cent were owned free of all encumbrance. The significance of this fact is rendered more clear when you consider that only 71.2 per cent of the homes occupied by white heads of families in that year were owned. In the decade 1890 to 1900, the negro heads of families increased their ownership of homes to 21.8 per cent, and of this increased number, 74.2 per cent were owned as against 68 per cent for white heads of families. I am unaware that history records such an example of substantial progress in civilization in a time so short. Here is the unique fact that from a penniless population, just out of slavery that placed a premium upon thriftlessness, 372,414 owners of homes have emerged, and of these, 255,156 are known to own their homes absolutely free of encumbrance. In these heads of negro families lie the pledge of my race to American civilization.

In the occupations in which negroes are engaged, are they advancing to higher levels? Nearly four million negroes at least ten years of age were reported by the last census to be engaged

in gainful occupations; 33.7 per cent of the negroes occupied were agricultural laborers and 19 per cent were farmers, planters, and overseers, a total of 52.7 per cent being thus engaged in agriculture. Moreover, of the half million black "laborers (not specified)" it is probable that many were agricultural laborers. An investigation of the black farmers and laborers in the cotton belt of the South is an investigation of the great mass of the negro people in America.

The census for 1900 contains a considerable body of evidence that I might use for testing the progress of the Southern negro in agriculture. Thus, as we have seen, about 34 per cent of the negro wage-earners in the U. S. were merely agricultural laborers, and 19 per cent were farmers, planters, and overseers. These farmers, planters, and overseers, have simply lifted themselves by their boot straps! They have risen from a low to a higher level in their occupation and in American civilization. I might show how the negro agricultural laborer of exceptional ability has become share tenant, then cash tenant, then part owner, and finally full owner with almost lightning rapidity and against fearful odds. Moreover, I might cite in proof of the progress of the negro in agriculture the value of his farm products not fed to live stock. Thus, in the South Atlantic States, 35.5 per cent of the number of farms operated by negro farmers in 1900 had products in 1899, not fed to live stock, worth \$100 and under \$250, and 30.4 per cent had products worth \$250 and under \$500. And in the South Central States 31.6 per cent of the number of farms operated by negro farmers had products in 1899 not fed to live stock worth \$100 and under \$250, and 36.7 per cent had products worth \$250 and under \$500. This is an enormous advance for the negro since 1860.

But I propose to test the progress of the negro in agriculture by the severest test—not a comparison with European peasantry, but with native whites of native parents in the Southern States. Certainly no fair-minded man could wish a test more severe; certainly we should be surprised if these native whites of purest stock did not immensely outstrip the negroes. Let us, however, inquire how these two classes with respect to the relative number of owners added in forty years.

Practically all the negro owners of farms have become owners since 1860; in that year the negro was landless. In the South Central States since 1860 negro farmers have come to operate as owners and managers 95,624 farms and as tenants 348,805. The farms operated by owners or managers are thus 21.5 per cent of the total. The per cent of gain in ownership is about half that made by the white farmers since 1860. These facts spell progress unmistakably. In forty years 287,933 negroes have acquired control of farm land in the South Atlantic States, of whom 202,578, or 70.4 per cent, are tenants and 85,355, or 29.6 per cent, are owners or managers. In these eventful forty years the relative number of owners among the negro farmers of the South Atlantic States has grown from absolutely nothing, three fourths as rapidly as the relative number of owners among the whites, who in 1860 owned every acre of the land. In both the South Central States and South Atlantic States the negroes have thus compassed a magnificent achievement.

The total value of negro farm property is conservatively estimated at \$230,000,000.

In the short space at my disposal I have simply attempted to indicate some of the ways in which the negro of the South has made substantial progress, has responded to the demands of American civilization.

BOOKER T. WASHINGTON.

Normal schools, with 8,147 students, and 61 industrial schools, with 1,750 students in attendance. In doing this great work, for buildings, repairs, teachers, etc., \$1,002,896.07 was expended. Of this sum the freedmen raised \$200,000.

The following table shows the progress since 1870:

| STATE | Estimated number of persons 5 to 18 years of age | | Pupils enrolled in public schools | | Per cent of persons 5 to 18 years enrolled | | Per cent of average attendance to enrollment | |

| Negro population, 1900..... | 8,848,749 |

Land and improvements, \$324,242,997; buildings, \$71,902,265; implements, \$18,859,757; live stock, \$84,936,215; total, \$499,941,234. Negro owners of premises: Virginia, 26,566; Mississippi, 21,973; Texas, 20,139; South Carolina, 18,970; North Carolina, 17,520; Alabama, 14,110; Arkansas, 11,941; Georgia, 11,375; Tennessee, 9,426; Louisiana, 9,378; Florida, 6,552; Kentucky, 5,402; Maryland, 2,262; West Virginia, 534; Delaware, 332; District of Columbia, 5. Homes owned by negroes, 1,832,723; farms, 757,427; other homes, 1,075,296; total, 3,665,446.

In Georgia, negroes owned, in 1901, 1,041,135 acres valued at \$4,656,042 and city lots and buildings valued at \$9,007,977. Personality, \$6,621,834. (Report of Controller General.) In Virginia, in 1901, they owned 1,066,303 acres, valued at \$4,342,074, with city lots and buildings valued at \$12,856,417 and personality of \$3,966,194. (Auditor's report.)

On the 20th of May, 1865, Major-General O. O. Howard was appointed Commissioner of the Freedman's Bureau. He gave great attention to the subject of education, and after

Education

planting schools for the freedmen throughout a great portion of the South, in 1870—five years after the work was begun—he made a report: Schools established, 4,239; teachers employed, 9,307; pupils, 247,333. The emancipated people sustained 1,324 schools themselves, and owned 592 school buildings. The Freedman's Bureau furnished 654 buildings for school purposes. There were 74 High and

Normal schools, with 8,147 students, and 61 industrial schools, with 1,750 students in attendance. In doing this great work, for buildings, repairs, teachers, etc., \$1,002,896.07 was expended. Of this sum the freedmen raised \$200,000. The following table shows the progress since 1870: For 1901-2 the common-school expenditure in the sixteen former slave states, with the District of Columbia, for both races was \$37,567,552. About 20 per cent of this amount was expended upon the public schools for the negroes. The aggregate common-school expenditure in the South since 1870 has been \$687,691,329. It is estimated that at least \$125,000,000 of this sum has been expended to support common schools for negro children. While General Howard, General John Eaton, A. D. Mayo were the leaders in establishing the common-school system of the South, they found worthy assistants in the Rev. R. H. Cain of South Carolina, Rev. C. H. Pierce and Rev. J. H. Gibbs of Florida, Bishop Hood and G. W. Brodia in North Carolina, Dr. H. M. Turner, Rev. W. J. Gaines in Georgia. It was the joint work of the leaders of the two races. The progress of the colored schools has only been excelled by the progress of the colored teachers. When organized there were not more than 500 teachers, while now we have them manning all departments of educational work. BENJAMIN W. ARNETT.

NEIGHBORHOOD GILDS: The name of certain social reform institutions first proposed by Dr. STANTON COIT (q. v.), as the result of his experience in the social settlements started by him in New York City and London. He embodied his ideas on this subject in a book entitled "Neighbourhood Guilds," published in 1891. According to this work (p. 7), "The very name, 'neighbourhood gild,' suggests the fundamental idea which this new institution embodies: namely, that, irrespective of religious belief or non-belief, all the people, men, women, or children, in any one street, or any small number of streets in every working-class district in London, shall be organized into a set of clubs, which are by themselves, or in alliance with those of other neighborhoods, to carry out, or induce others to carry out, all the

reforms, domestic, industrial, educational, provident, or recreative, which the social ideal demands." Dr. Coit's idea is that the forming of separate societies or clubs for special purposes tends to magnify out of all proportion that one side of life or culture which it aims to develop. It tends again to break up the family unit. It sends the boys to one club, the girls to another, the father to another, the mother to another. Thirdly, it breaks up neighborliness. The Neighborhood Guild aims at organizing the social life of all the people in one small district. It thus brings neighbors together, families together, different interests together. In the Neighborhood Guilds there are departments for boys, for girls, for men, for women, for art, for education, for recreation, for the various interests of life; and they are not all separate; for certain purposes, and at certain times, all come together. According to Dr. Coit, no guild should be so large as to prevent all the members forming a circle of acquaintance. To develop persons in all sides of character is its aim. Dr. Coit started the first guild in New York City, about 1885, and it has now grown into a University Settlement (*q. v.*). In 1889 Dr. Coit, on his removal to London, started one there in Kentish Town. For all details, see Dr. Coit's book, "Neighbourhood Guilds."

NEILL, CHARLES P., Ph.D.: United States Commissioner of Labor; born Rock Island, Ill., 1865; educated at University of Notre Dame 1885-88; University of Texas, 1888-89; Georgetown College, D. C., 1889-91; University of Chicago, 1894-97; instructor University of Notre Dame, 1891-94; instructor and associate professor of political economy, Catholic University, Washington, D. C., 1897 to 1905; assistant recorder of Anthracite Strike Commission (1902) (see **COAL STRIKE**); recorder of Arbitration Board, Birmingham (1903). Appointed U. S. Commissioner of Labor, Feb. 1, 1905. As commissioner has been active in settling important strikes. In 1906 with J. P. Reynolds (*q. v.*) made an important report as to the packing-house industry in Chicago. (See **PACKING-HOUSE INDUSTRY**.) Address: U. S. Bureau of Labor, 1429 N. Y. Avenue, N. W., Washington, D. C.

NELSON, NELSON O.: Manufacturer and co-operator; born in Norway, 1844; came to United States as a boy; educated in public schools. In 1872 he established himself as a manufacturer of plumbers' and steam-fitters' supplies in St. Louis, with manufactories at LeClaire, Ill., and now recently at Bessemer, Ala. In 1886 he introduced profit-sharing (*q. v.*) into his works, and in 1890 established the cooperative village of LeClaire, Ill. (*q. v.*). In 1902 he established a "Consumptives' Camp" on desert sand at Indio, Cal., and in 1903 an industrial school at LeClaire. Mr. Nelson has been one of the most active leaders and workers in national and local movements for social reform, especially as regards cooperation, the single tax, and evolutionary socialism. In his views Mr. Nelson is a Tolstojan and non-resistant, and believer in "the simple life," tho largely favorable to the Socialist program, if adopted without any compulsion. Address: LeClaire, Edwardsville, Ill.

NETHERLANDS, THE: A European kingdom—formerly the Republic of The Netherlands—constituted a hereditary monarchy in 1815.

I. Statistics

AREA AND POPULATION

| PROVINCES | Area sq. m. | Population 1904 | Per sq. m. |
|--------------------|----------------|--------------------|---------------|
| North Brabant..... | 1,980 | 589,725 | 298 |
| Guelders..... | 1,965 | 604,668 | 308 |
| South Holland..... | 1,166 | 1,263,136 | 1,083 |
| North Holland..... | 1,070 | 1,053,083 | 984 |
| Zealand..... | 690 | 225,562 | 327 |
| Utrecht..... | 534 | 272,913 | 511 |
| Friesland..... | 1,282 | 353,363 | 276 |
| Overijssel..... | 1,291 | 359,443 | 278 |
| Groningen..... | 790 | 315,873 | 399 |
| Drenthe..... | 1,030 | 162,141 | 157 |
| Limburg..... | 850 | 309,752 | 364 |
| Total..... | 12,648 | 5,509,659 | 436 |

The population is almost entirely Dutch, there being (1899) only 52,625 foreigners in the kingdom. The principal cities are: Amsterdam (population 551,415), Rotterdam (370,390), The Hague (234,459), and General Statistics Utrecht (112,796). The birth-rate in 1904 was 31.02, and the death-rate 15.82. Total number of births, 171,495; of deaths, 87,128; surplus, 84,367. The illegitimate births numbered 3,659, or about 2.15 per cent of the total number. Marriages in 1904 were about 8 per 1,000 of population. The urban population numbers 2,049,779, or 37.2 per cent, and the rural 3,459,880, or 62.8 per cent.

With regard to religion the (1899) population is divided as follows: Dutch Reformed, 2,471,021; other Protestants, 598,111; Roman Catholics, 1,790,161; Jansenists, 8,754; Jews, 103,988; other creeds, 132,102. There is full religious liberty, and the State pays annual allowances to the main bodies as follows: To Protestants, 1,373,000 florins; Roman Catholics, 578,000 fl.; Jews, 14,000 fl. In 1904 the Protestant churches had about 1,900 clergymen; the Roman Catholics, 2,700; the Jansenists, 27.

The cost of primary education in The Netherlands is defrayed partly by the State and partly by the communes. Instruction is compulsory

Education between the ages of six and thirteen, and illiteracy is rare. Elementary education is largely in the hands also of private schools, which are supported by the State. Religious instruction is separated from secular instruction. There were, in 1904, four universities (Leiden, Utrecht, Groningen, and Amsterdam) with 182 teachers and 3,135 students, of whom 331 were females. Elementary schools numbered 4,796 (3,216 public and 1,580 private), with 26,114 teachers and 831,589 pupils. There were 1,112 infant schools with an attendance of 118,230 children. The teachers are trained in normal schools supported by the State; and there are also several industrial, agricultural, and technical high schools, as well as a military academy, eleven navigation schools, an academy of art, and a polytechnic institute. The total expenditures for educational purposes (State and communes) were, in 1903, about \$12,000,000.

In 1903 there were 31 prisons and 36 houses of detention. Convictions for crime numbered (1904) 17,393, and for minor offenses 146,174. Workhouses for vagabonds and drunkards are five in number, having, in 1903, 6,304 inmates. In the same year there were 700 boys and 114 girls in four State reformatories. Pauperism is

largely relieved by private charity and by religious societies. About 3.25 per cent of the population received aid in 1903. Mendicants and vagabonds are treated as criminals and sentenced to work in State institutions.

The Netherlands is largely an agricultural and horticultural country. The soil is generally divided into small holdings, altho comparatively large estates prevail in some provinces. In 1904 there were 216,092 hectares under rye, 158,732 under potatoes, 144,762 under oats, and 54,081 under wheat. Buckwheat, legumes, and beet-roots are also important. Fishing engages 5,781 vessels with about 22,000 men. Herrings and oysters are the chief catches.

Mining is unimportant, with the exception of coal which yields an annual revenue of about 2,000,000 florins in the province of Limburg, the mines being nearly all owned and operated by the State. Manufacturing establishments comprize 531 distilleries, 40 sugar refineries, 39 salt works, 476 breweries, and 90 vinegar distilleries.

Trade is free in The Netherlands, the duties levied on imports being too insignificant to afford protection to home industries. The total exports for 1905 amounted to 1,994,000,000 florins, and imports to 2,584,000,000 fl. The chief articles of import were: Cereals and flour, 476,329,000 fl.; iron and steel, 301,405,000 fl.; textiles, 144,131,000 fl.; copper, 14,130,729 fl.; coal, 81,220,000 fl.; and rice, 66,448,000 fl. Chief exports: Cereals and flour, 188,476,000 fl.; iron and steel, 188,476,000 fl.; textiles, 107,343,000 fl.; copper, 105,127,000 fl.; oleomargarin, 51,432,000 fl.; vegetables, 45,300,000 fl.; wood, 53,670,000 fl.; butter, 23,607,000 fl.; and cheese, 16,363,000 fl. The values of imports and exports by countries were as follows in 1905:

| COUNTRY | Imports, Florins | Exports, Florins |
|------------------------|---------------------|---------------------|
| Prussia..... | 577,500,000 | 1,008,300,000 |
| Great Britain..... | 263,900,000 | 409,700,000 |
| Belgium..... | 254,000,000 | 227,200,000 |
| Dutch East Indies..... | 399,600,000 | 70,500,000 |
| Russia..... | 319,000,000 | 12,000,000 |
| United States..... | 240,700,000 | 81,300,000 |
| France..... | 22,300,000 | 14,900,000 |

II. Constitution and Government

The present constitution of The Netherlands dates from its reconstruction as a monarchy in 1815, and was revised in 1887. The present ruler is Queen Wilhelmina who succeeded to the throne in 1890, the crown being hereditary in the female line in default of male heirs. The sovereign holds the executive power, while the legislative functions are vested in a parliament (the States-General) consisting of an Upper and a Lower Chamber. The Upper Chamber consists of fifty members elected for nine years by the provincial states from among the highest taxpayers. The Lower Chamber consists of 100 members who are elected for a period of four years by universal suffrage, all male citizens of more than twenty-five years of age being entitled to vote if they fulfil certain qualifications with regard to economical conditions. Bills can be introduced only by the government or by the Lower Chamber. The Upper Chamber passes on the bills, either approving or rejecting, but has no power of amending any measures introduced.

The main parties are Liberals and Anti-Liberals, the latter being composed of Catholics and orthodox Protestants, who are also called Conservatives. The Catholics and Protestants unite only in demanding that government recognize the supremacy of religious authority, and the Anti-Liberals urging that the religious questions be kept separate from the government.

In 1901 a split took place through the advanced section of the Liberals demanding universal suffrage on the "one man one vote" basis. This broke up the powerful Liberal Union, and the election of 1901 resulted in the return of 32 Protestant Anti-Revolutionists, 25 Catholics, and one Christian Democrat, forming the Right, 58 strong; and of 26 Liberals, 9 Radicals, and 7 Socialists, forming the Left, 42 strong. Dr. Kuyper, the leader of the Anti-Revolutionists, then formed a cabinet, in which three seats were given to the Catholics.

This ministry was overturned in the election of 1905, when there were elected to the Second Chamber 52 Liberals (24 Liberals of the Left, 10 Liberals of the Right, 11 Liberal Democrats, and 7 Socialists), against 48 Ministerials (24 Catholics, 16 orthodox Protestants, and 8 "Historic Christians"). M. de Meester formed a cabinet avowedly free trade. In the First Chamber there was a small clerical majority.

The present government is partly Liberal, partly Liberal Democratic, having only a very small majority in the Second Chamber, counting the Social Democrats on its side. The Roman Catholics base their program on the Encyclica Rerum Novarum. The Anti-Revolutionist Protestants represent the Orthodox religion. The Liberals are led by Goeman Borgesius and Professor Van der Vlugt. The Liberal Democrats, under leadership of Professors Drucker and Treul, aim at curtailing the privileges of capital and securing the rights of labor and of the laborers, and at a more equitable distribution of wealth. They maintain the urgency of changing the constitution in order to take away the obstacles against the introduction of universal suffrage.

For purposes of local administration each of the eleven states has its own House of Representatives whose members are elected for six years by a popular vote. These provincial bodies have full power of legislation and taxation within their jurisdiction, altho their ordinances must be submitted to the sovereign for approval. Municipal boroughs have an aldermanic board presided over by a mayor appointed by the sovereign.

The estimated expenditures for 1906 amounted to 181,714,219 florins, and the revenues to 171,432,295 fl. Of the revenues 54,080,000 fl. were derived from excise duties, and 24,141,500 from indirect taxes. The national debt (1906) is 1,144,757,450 fl., its annual interest being 36,674,411 fl.

Finances

The army, which is drawn partly by conscription and partly by enlistment, numbers 30,131 men on a peace footing, and about 68,000 men on a war basis. There is also a national guard, and a *landstorm* or emergency reserve which consists of all able-bodied men. The yearly contingent for the regular arms is about 17,500 men. The navy is maintained for coast defense and for the defense of the East Indian colonies. It numbers 8 battle-ships, 8 cruisers, 2 old ironclad turret ships, 6 unprotected cruisers, 30 old gunboats, several coast-defense monitors, and 40 torpedo

boats (about 20 additional building). The complement of officers and men is about 8,500; and of the marine infantry about 2,200.

There are (1904) 1,817 miles of railroads, of which 985 miles belong to the State, the balance to private companies. In 1904 the revenue of the State lines was 27,157,000 florins; expenditures, 23,572,000 fl.; freight carried, 8,335,000 tons; passengers, 13,714,000. The private lines had a revenue of 23,373,000 fl.; expenditures, 18,828,000 fl.; freight, 5,372,000 tons; passengers, 24,460,000. There are 1,907 miles of navigable canals. Post-office receipts (1904) amounted to 12,539,858 fl., and expenditures to 9,846,599 fl. Most of the telegraph lines are owned by the State. In 1904 there were 826 State telegraph offices, the length of the lines being 4,296 miles and that of wires 18,901 miles. Paid messages numbered 5,807,951; the receipts aggregated 2,557,330 fl., and expenditures 3,184,655 fl. In the same year there were 1,431 miles of telephone lines; 15,460 miles of wires; 1,390,520 interurban and 79,566 international conversations. Telephone revenues amounted to 507,675 fl., and expenses to 55,471 fl. There are 247 private savings-banks and 1 State postal savings-bank. The amount deposited in the former aggregated (1903) 83,976,000 fl., and in the latter (1904) 120,435,000 fl., the average per inhabitant being 15.46 fl. in private banks, 21.86 in the postal bank. The merchant marine numbers 467 sailing vessels of 59,364 tons, and 269 steamships of 341,964 tons.

The colonies belonging to The Netherlands are situated in the East and West Indies. The chief dependencies in the East Indies are: The western and southern parts of the island of Borneo (212,737 sq. m.; pop. [1900] 1,129,889); the islands of Celebes (71,470 sq. m.; 884,141); Java and Madura (50,554 sq. m.; 28,746,688), and Sumatra (161,612 sq. m.; 3,168,312); the Molucca Islands (43,864 sq. m.; 410,190); and part of New Guinea (151,789 sq. m.; about 200,000). In the West Indies: Surinam or Dutch Guiana (46,060 sq. m.; 73,542), and the Curaçao Colony (403 sq. m.; 53,244). These possessions enjoy religious liberty and a steadily increasing educational system based on that existing in the mother country. Commercially they are of vast importance.

III. Social Reform

The chief political question agitating Holland has long been that of the relation between Church and State, and the main parties are, therefore, largely formed according to this question. Attempts are constantly being made to effect party formation along lines of social reform; and despite lack of success in the past it is believed that a change in the franchise and taxation systems will in course of time alter political conditions.

In 1898, at the request of the government, Professor Drucker drafted a bill to regulate labor conditions, especially with regard to contract labor. According to more recent legislation the regulation of labor contracts is to be incorporated in the civil code. A bill has passed the Lower Chamber of the States-General, and is expected to pass also the Upper Chamber. It provides for the rights of married women to contract for their labor without the consent of their husbands; for the employers' liability toward workmen in cases of sickness; and for the employers' right to collect damages in cases where the

workmen, through neglect, cause deterioration in value of products or machinery.

The conditions of labor are regulated according to a law of 1889, and a "safety act" of 1895. These acts stipulate that women and young persons under sixteen must work no more than eleven hours per day, and that the hours of work must be between 5 A.M. and 7 P.M. Nor are women and young persons permitted to be employed on work of unhealthy and dangerous nature. Hours of rest are provided, Sunday labor prohibited, and the employment of children under eleven proscribed. A royal decree of 1896 further provides for sanitary requirements and inspection of workshops and factories, and makes the employment of safety devices obligatory on the employers.

An act of May 21, 1897, provides so-called chambers of labor, which are to mediate between employers and employees in cases of dispute. Each "chamber" embraces one or more communities, and is composed of five employers and five employees chosen by the work people engaged in the particular industry in which it operates.

Accident insurance is provided for by Act of 1901, by virtue of which all industries in which motors or steam- or gas-engines are used are liable to pay a workman certain damages for injury sustained in the line of duty. A notable clause in this act is one which reduces the amount to which a worker is thus entitled if he was intoxicated when meeting with his injury.

The Housing Act of Aug. 1, 1902, imposes upon each municipality certain rules regarding the construction and location of houses, and contains also measures intended to guard against overcrowding. Moreover, it regulates to a certain extent the amount of rent an owner may exact for his property, by stipulating a maximum percentage of interest which may be collected on the investment. In cases where private enterprise fails to provide adequate house room, provision is made for the erection of dwelling-houses by the municipality.

In Amsterdam and Utrecht government committees have been appointed to investigate the question of providing against unemployment; and measures have been proposed introducing the so-called "Ghent System," by which each municipality is to cooperate with the local trade-unions who maintain insurance funds against loss of employment. In The Hague, Leyden, Haarlem, Schiedam, and other towns, municipal labor bureaus have recently been established; and a great many commercial and industrial agencies, as well as trade-unions and private concerns, operate similar bureaus.

Three acts passed in Feb., 1901, provide (1) for the care of children whose parents neglect them, (2) for the legal procedure against children who commit criminal acts, and (3) for compulsory education. There are in Amsterdam two societies which look after the welfare and protection of children. Orphans are cared for in municipal and religious homes; and there are also several private institutions that look after the education and care of destitute and neglected children. There are besides about twenty-five societies which are occupied in sending poor children to the seashore or country during the summer. School children who are in need may be provided with food and clothing at the expense of the municipality.
